Titness Park, Sunning-Hill.—In the Conservatory at this place is a very fine specimen of Zichya tricolor, a beautiful introduction from Swan River. It was presented by Mr. Mangles in May last to the present gardener, at which time it scarcely measured 6in. in height; now it covers 15 square yards of trellis-work, and is producing its brilliant flowers in profusion, reminding us of large masses of scarlet Verbenas. Here also we observed some good specimens of Chorozema cordatum, which were growing luxuriantly in a mixture of decomposed Beech-leaves and sand; the pots being well drained with the hard and rough husks of Beech-nuts.—*April* 26.

J. Bateman, Esq., Knypersley.—In the Orchidaceous house the following plants are now in full bloom:—Dendrobium sulcatum, D. nobile, D. densiflorum, D. amœnum, D. Pierardii, Epidendrum Stamfordianum, E. patens, E. aromaticum, E. macrochilum, Cattleya Skinneri, Lælia cinnabarina, Stanhopea quadricornis, Broughtonia sanguinea, Maxillaria Skinneri, M. aromatica, Stenia pallida, Bonatea speciosa, Trichopilia tortilis, Oncidium altissimum, O. hians, O. ampliatum, O. papilio, O. Cebolleta, Masdevallia infracta; *cum multis aliis.* The rare Aerides Brookeii is producing a vigorous raceme of flowers, from which it is intended to prepare a figure for some of the botanical periodicals.—*May* 2.

CALENDAR OF OPERATIONS *for the ensuing week.*

The continued drought will have caused many important operations to be deferred; these, especially the sowing of seeds and the planting of kitchen-garden crops, must be attended to immediately upon the first fall of rain. If, however, this does not soon occur, unremitting attention will be requisite in watering not only recently-transplanted crops, but young seedling vegetables, particularly those kinds which afford what may be termed permanent crops, as the Brassica tribe. Those who have available means will find the construction of some temporary shading a very useful auxiliary to the watering-pot. Seed-beds, for instance, might be defended from the scorching sun by a few mats stretched across a slight framing of sticks; these might be taken off every evening and replaced next morning, by which the plants would be greatly benefited, and both labour and water economised. Unless absolutely necessary, planting should not be attempted while the ground is so dry.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—When hot sun is accompanied by a keen drying wind, a few leafy branches laid upon the glass to break the sun's rays will be better for young growing plants than an indiscriminate admission of air. In houses which have Vines trained to the rafters, of course this shading is unnecessary. In very hot and bright weather, the atmosphere of the houses during the day cannot be made too humid by the usual means. The violent fermentation of the bark-bed will most likely be moderated by this time; if so, draw the bark close round the pots, if only partly plunged; its surface should also be occasionally moistened. Look over the plants every other day at farthest, in hot weather, and water those which require it. Always water before the soil gets very dry, and give but a small quantity at once.

Vinery.—Where a top-dressing has been retained, as advised at p. 272, it will be found that the exterior borders do not soon become injuriously dry, but where the surface of the soil is exposed, copious waterings will be necessary during drought. The waste water from the laundry is a powerful fertiliser, and may be advantageously used for this purpose. Syringe the leaves lightly, and close the houses while the sun has power to raise them to 90° or 95°, which, in conjunction with a moist atmosphere, will not in any way injure the plants. In the mornings of clear days, give air before the houses get warm; say when the thermometer rises above 70°. Water ought never to touch the Grapes after the first indications of ripening appear.

Peach-house.—Early forced fruit is generally insipid from the want of sun and air; but in a season like the present, there need be no deficiency of flavour if the directions given last week are followed. Remove any leaves which shade the fruit. Tie the shoots regularly to the trellis in the later houses, and do not retain too many. To reduce the strength of luxuriant trees, let them bear an extra number of fruit. Check, by frequent washings, the insidious advances of the red spider.

Cherry-house.—See the directions given last week.

Fig-house.—Where forcing was commenced in January, the fruit will now be taking its final swell, and some of the earliest sorts are probably approaching maturity, in which case the supply of water must be diminished, but not wholly withheld. Give air freely, and apply no more fire heat than is necessary.

Strawberries.—If the weather continues hot, ripening fruit should be removed out of the burning sun to a more shady part of the house, when less water will be needed, and the fruit will longer retain its freshness.

Cucumbers and Melons.—Melons that are nearly ripe must not have much water. If, as formerly directed, the surface of the mould is covered with some substance to lessen evaporation, water will seldom be required. Try every means to keep the leaves in health; for if these are scorched by heat or damaged by insects, the flavour of the fruit will be much deteriorated. Let no more fruit stand in the Cucumber frames than is requisite for a regular supply. Preparations should now be made for ridging out Cucumbers. Gourds and Vegetable Marrows intended for planting out must not be brought up too tenderly.

Mushroom-house.—Keep the paths constantly moist, and if hay is used for covering the beds, that also should be sprinkled.

Potatoes that are fit for table might be taken up and stored in dry sand, and the frames afterwards planted with Melons.

Out-door Department.

Asparagus.—Look over the beds every morning and cut all the shoots that are long enough; they should afterwards be sorted, counted, and tied up in bundles, setting the bottoms in pans of water till they are wanted for use.

Beans.—Put in another crop, and earth those that require it. The young plants here are much damaged this season by an insect, apparently a species of Curculio, which feeds upon the tender leaves. Possibly repeated dustings with soot, when the plants are moist, may be a palliative.

Broccoli.—Continue to take up and retard the late sorts before the heads get too large. If not yet done, sow for spring use. By sowing several sorts, a better supply will be obtained.

Cauliflowers.—The spring-sown plants which have been raised under glass will now be ready for planting out, which should immediately be done if the ground is not too dry. In situations where the club is prevalent, a little quicklime might be put round the roots; this substance, and also wood-ashes, are said to be preventives. Another reputed remedy is to dip the roots and stems of the plants, as high as the leaves, into some thick fetid mixture, such as the mud from a cesspool. This offensive coating is said to prevent the fly from laying its eggs on the plants.

Celery.—Continue to prick out the young plants as they become large enough. When leisure permits, dig out the trenches in readiness for planting the first crop. A few inches of rich compost in the bottom of the trenches is preferable to digging in dung in the usual way. After this is finished, a row of Lettuce from the frames may be planted along the middle of the raised spaces between the trenches which are meant for early Celery; and Cauliflowers planted, or Peas sown, between those intended for later crops.

Mustard and Cress, Radishes, and other kinds of salading, which soon run to flower, should be sown, according to the demand for them, on a shady border.

Turnips.—Those last sown have probably been damaged by the flea during the drought; in which case another sowing should be made as soon as possible.

Orchard.—Wall-trees now require constant attention, in displacing useless shoots and checking the increase of injurious insects. In many situations Peaches and Nectarines will be far enough advanced to undergo their first thinning, which ought never to be deferred after the fruit is larger than a good-sized Hazel-nut, except with an intention of weakening the trees. Use the engine two or three times a week in dry weather. Weak Pear-trees sometimes produce a profusion of bloom, which should be thinned with scissors, leaving not more than three flowers on a corymb. If the fruit is already set, that should be similarly treated. At this season the Gooseberry and Currant caterpillars generally begin their ravages. Various methods have been recommended for their destruction, of which the most effectual seems to be dusting them with dry Hellebore-powder.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Look over the directions given during the last month, and continue the varied operations there recommended. Do not shade more than is actually necessary, and keep the paths and shelves of the house continually moist in bright weather. Many of the plants may be kept much longer in flower if placed in a cool house with a north aspect; this is sometimes requisite, in order to retard those which are destined for exhibition.

Greenhouse and Conservatory.—It is best not to be too hasty in exposing tender greenhouse plants to the rapid variations of our uncertain climate; nevertheless, most of the hardier and less valuable species may be set out now. Heaths, Corræas, Epacrises, &c., may be removed to a cool pit, where there is such a convenience. Plants of the various species of Cytisus, which have done flowering, should be pruned in and tied, and, if necessary, potted. Chinese Azaleas ought also to be similarly treated. The best sorts may be inarched, or cuttings of the young shoots put in now. Water growing Camellias freely, and give them plenty of room.

Pits and Frames.—Excepting the most tender kinds, plants for bedding should be set out of the pits; the hardier may, in fact, be planted now, if the weather will permit. Annuals for blooming in pots should be always repotted before the roots get matted. Pot off young plants of the Chinese Primrose. Hydrangea cuttings, put in a month ago, will have filled their pots with roots, and should be repotted in rich soil. The most forward Dahlia plants should be set out in some sheltered spot, to harden them previously to being planted.

Out-door Department.

Partial rains having fallen during the last few days, those who have been favoured ought to lose no time in planting out the most forward annuals. The general planting of the flower-beds may also be proceeded with, beginning with those plants which would suffer least by the return of cold winds or casual frosts. Ranunculus roots may yet be planted to produce a late bloom previously soaking them five or six hours in water. Put in cuttings of Pansies and Double Wallflowers; also divide and transplant Neapolitan and Russian Violets, for flowering in pots in winter. Plant out dry roots of Dahlias.

NURSERY AND FOREST DEPARTMENT.

Nursery.—The principal business in this department now is the weeding and occasional watering of seed-beds and young transplanted stuff.

Forest and Coppice Woods.—The barking season, which may be called the forester's harvest, is now at its height in most parts of the country, and no time should be lost in bringing it to a conclusion while the fine weather holds.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending May 5, 1842, as observed at the Horticultural Garden, Chiswick.

	Barometer.		Thermometer.			Wind.	Rai

Average	29.955	29.836	69.0	40.4	54.7		.18

April 29. Dry, with slight haze; fine; cloudy.
30. Fine; clear at night.
May 1. Clear and very dry throughout.
2. Excessively dry, with brisk N.E. wind; slight frost at night.
3. Clear and very fine; slight rain in the evening.
4. Light clouds and fine; clear at night.
5. Fine; light clouds; overcast; heavy rain at night.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending May 14, 1842.

The highest temperature during the above period occurred on the 12th, 1833—thermometer 81°; and the lowest on the 14th, 1838—thermometer 28°.

REPORT ON COVENT GARDEN MARKET,

For the week ending May 6, 1842.

The supplies of most kinds of Fruit and Vegetables during the past week have been good, and trade continues much the same as in our last Report. *Fruit:* Pines are tolerably plentiful; many of them are very fine, and are selling from 10s. to 16s. per pound. Forced Grapes are abundant, chiefly the Black Hamburgh, which in many instances are as good as could possibly be produced at a later season. They fetch from 9s. to 14s. per pound. Peaches and Nectarines are scarce, and are selling from 30s. to 40s. per dozen. The supply of Cherries is still very limited; and a few green Apricots are to be met with at 2s. per pottle; Pears are very scarce, at 9s. per dozen. Although Apples have been tolerably plentiful, trade has not been quite so brisk; the Dessert kinds selling from 5s. 6d, to 14s. per bushel; the Kitchen kinds from 4s. to 7s. 6d. Of Strawberries there is a pretty good supply at the same price as quoted last week; Cucumbers likewise continue just the same. *Vegetables:* The supply of Broccoli has been tolerably good from 6d. to 2s. 6d. per bunch; and Cabbages are also plentiful. Asparagus is abundant, and is considerably cheaper, the best samples fetching from 3s. 6d. to 5s. per 100. New Potatoes are rather more numerous—the Round ones selling from 1s. 6d. to 3s. per lb., and Kidneys from 2s. to 4s. A few young Carrots and Turnips may also be procured. French Beans still remain the same as in our last account. Sea-kale is nearly over; Cos Lettuces are abundant, so also is every description of Salading. Rhubarb is very plentiful, and of excellent quality; the smaller kinds from 4s. to 10s. per doz. bundles; the Victoria from 1s. to 2s. per bundle. Mushrooms are rather scarce from 1s. to 2s. per punnet. *Flowers:* Of these there is a beautiful display; amongst the cut ones are some handsome Geraniums, white Azaleas, Gardénias, Ericas, Daphnes, Ixias, Cloves, and Carnations.

PRICES Saturday, May 7, 1842.—FRUITS:—

Apples, Kitchen, per bush. 4*s* to 8*s*
— Dessert, per bushel, 5*s* to 14*s*
Pears, dessert, per half-sieve, 4*s* to 20*s*
Strawberries, forced, per oz., 6*d* to 1*s*
Peaches, per doz. 30*s* to 40*s*
Nectarines, per doz., 30*s* to 40*s*
Apricots, green, per punnet, 2*s*
Pine Apple, per lb. 10*s* to 16*s*
Grapes, hothouse, per pound, 10*s* to 14*s*
— Spanish, per lb., 1*s* to 2*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 9*d* to 2*s* 6*d*
— per 100, 5*s* to 20*s*
— Bitter, per 100, 8*s* to 18*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 16*s*
Cucumbers, per brace, 1*s* to 4*s*
Cherries, per lb. 20*s* to 30*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Walnuts, per bushel, 16*s* to 24*s*
Filberts, Eng., per 100lbs., 150*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, White, 1*s* to 2*s* 6*d*
Cabbage, Red, for pickling, 3*s* to 6*s*
Cabbage Plants, per doz., 2*s* 6*d* to 6*s*
Broccoli, White, p. bnch., 1*s* to 3*s*
— Green, 8*d* to 2*s*
— Purple, 1*s*
Cauliflowers, per doz., 2*s* to 12*s*
Kidney Beans, forced, p. 100, 1*s* 6*d* to 3*s*
Potatoes, per ton, 45*s* to 90*s*
— per cwt. 2*s* 6*d* to 4*s* 6*d*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
— New, per pound, 1*s* to 3*s*
Turnips, White, per bunch, 2*s* to 3*s*
— young, 1*s* 6*d* to 2*s* 6*d*
Parsneps, per dozen, 9*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 6*d* to 1*s*
— Turnip, p. doz. bch., 1*s*
Spinach, per sieve, 1*s* to 2*s*
Chives, per pot, 3*d*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb. 1*s*
Shallots, per lb., 2*s*
— Green, per bunch, 3*d*
Onions, per half sieve, 3*s* to 3*s* 6*d*
— for pick., per hf.-sieve, 4*s*
— Green, per doz. bches., 2*s* to 4*s*
— Spanish, per dozen, 1*s* to 3*s*
Asparagus, per 100, large, 4*s* to 5*s*
— Second or Middling, 2*s* to 3*s* 6*d*
— Sprue, or Small, 1*s* to 1*s* 6*d*
Sea-kale, per punnet, 1*s*
Lettuce, Cabbage, p. score, 6*d* to 1*s*
— Cos, per half sieve, 9*d* to 3*s*
Endive, per score, 1*s* 6*d*
Celery, per bundle (12 to 15) 6*d* to 1*s* 6*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch. 6*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Tarragon, per dozen bunches, 2*s* to 3*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s*
Mint, per dozen bunches, 1*s* 6*d* to 3*s*
Marjoram, per doz. bunches, 6*s*
Basil, per bunch, 6*d* to 8*d*
Rhubarb Stalks, doz. bundles, 4*s* to 12*s*
Mushrooms, per pottle, 1*s* to 1*s* 6*d*

Notices to Correspondents.

C. C.—15*s*.

A Beginner.—The rules to be observed in applying Nitrate of Soda are,—1, to use it either broadcast or dissolved in water, at the time when plants are growing; 2, not to pour it over the leaves of plants, except Grass-land; 3, to use it in wet weather.

R. H. G.—The knots of Acer campestre form the beautiful wood called "Bird's-eye Maple," which is the famous Bruscum of the Romans.

A Constant Reader's plants are,—1, Pimelea ciliaris; 2, Ranúnculus parnassifólius; 3, Iberis sempervirens; 4, Aspérula odorata; 5, Euphórbia cyparíssias; 6, Saxífraga Sternbérgii.

An Original Subscriber.—You had better pick off all the infected leaves from your Roses and burn them; afterwards dusting the bushes well with flower of sulphur. We know of no other remedy for destroying the Green Caterpillar, which eats into the pith of your Rose-trees, than to collect all you can of them and crush them at once.

C. R. H.—The best Annual Creepers for light wire-work are Rhodochiton volubile, Eccremocarpus scaber, Maurándya Barclayana, Tropæ'olum peregrinum, Lophospermum scandens, and Loasa lateritia. The latter, however, stings. Hardy perennial kinds which will not be too heavy are Clematis azúrea grandiflora, flórida, and viticélla.

K. K. K.—The plant which you sent is now called Omphalodes verna, but used formerly to be called Cynoglossum omphalodes. The Hound's-tongue is a different plant altogether. It is best to sow the spores, or seeds, of Ferns in the autumn; they must not be covered with soil, like seeds, but merely scattered over the surface of the mould in a damp and shady situation. Although scions are generally taken off and laid in the ground some time previously to being used, yet the success of grafting is not dependent upon their being so treated. In our opinion it is of no benefit except where the scion belongs to an earlier variety than the stock upon which it is to be inserted; and were not the former retarded by this means, it must necessarily perish before the sap of the stock had commenced to flow. This is applicable to Roses as well as other things; the hardier kinds of these may be pruned any time between November and March; it is better to defer pruning the more tender ones until the spring, when you will be able to see which shoots have been injured by the frost.

A Kentish Man.—No. 1 of your plants is an Ipomœa, probably hederifólia; it requires to be starved, and kept warmer before it will flower, but is not worth the trouble; 2 appears to be a Clematis, but without a flower we cannot say what variety; 3 is Véstia lycioides. Your question respecting Clematis azúrea was answered last week among the Notices to Correspondents.

A Constant Reader's plants are,—2, Psorálea pinnata; 4, Leycestéria formosa: 5, Diosma ericoides, 6, Eurybia sp.; 7, Lasiopétalum solanáceum; 9, Chorozema nanum. The others are such wretched specimens that it is impossible to name them.

An Original Subscriber.—As you are desirous of covering your Rustic Arbour quickly, we would recommend you to purchase the following Climbers at a Nursery, instead of sowing seeds to effect that purpose:—Clematis viticella, C. virginiana, Ampelopsis quinquefólia, and Eccremocarpus scaber.—*Evergreens.* Clematis flammula rotundifolia, Caprifólium gratum, and C. sempervirens.

L. M. N.—If the piece of waste ground which you wish to convert into a Lawn lies in a swampy situation, we would advise to drain it; at all events, whether wet or dry, to dig it well and level. If you can procure turf in a sufficient quantity to cover the whole, it will be preferable to sowing it: but if done during this dry weather, it must be kept well watered, beating it firm and even when first laid down. Should you, however, be obliged to sow it, you had better defer it until the autumn; you will find a list of the best mixture of seeds for that purpose p. 553 of last year's *Chronicle.*—[If you wrote to us upon this subject a fortnight ago, we only received your letter last Saturday.]

F. X.—Tropæ'olum canariense is T. peregrinum. "Cutting back an Oleander when it begins to shoot," is generally practised upon sickly or straggling plants, and means pruning them back to those shoots or buds which are nearest the main stem, thereby inducing more vigorous growth, and rendering it more bushy. Your greenhouse, which you say is only a glazed lobby, fronting the south, and received no other assistance than burning a light or two in it during the coldest nights of winter, is not sufficiently warm to expand the blooms of your Oleander. The seed of Gaillárdia picta, Impátiens tricornis, &c., which you sowed on the 19th of March in a hotbed, must have been bad, or they would have germinated long before this. Although a regular temperature is preferable, still variation, unless carried to a great extent, is not prejudicial to germination; therefore although your bed might be very hot for an hour or two, it would not prevent your seeds, if good, from growing. It is better to let the weeds remain for a short time, until you are certain there can be no mistake. Primula sinensis is not difficult to raise, provided the seed is good. The Yellow Banksian Rose will succeed and bloom on a south wall in North Devon, if the roots are pruned every season to within two or three feet of the wall. Your plants of Fuchsia fulgens which appear like dry sticks, require more warmth, light, and moisture, to make them vegetate. No. 50 of last year's *Chronicle* is out of print; if any of our correspondents possess a duplicate of that Number we will willingly purchase it at double price.

A Cottager's plants—1, Anemone hortensis; 2, Alonsoa urticifólia; 3, Véstia lycioides; 4, Deútzia scabra.

W. W. J.—Your plant is Draba verna.

G. S.—The Apple you sent is a remarkably fine specimen of the Easter Pippin, or French Crab.

Tyro.—The best explanatory work upon the Linnean system is "Smith's Introduction to Botany."

Nemo.—The small plant you sent is Chrysosplénium oppositifólium; the larger one, Mercurialis perennis.

W. W.—We should imagine that your suggestion of planting Strawberries on a bed in a pit heated by hot water would be a much better method than planting them in pots. The only objection to it is, that so few people can spare a pit for that purpose alone. We should feel obliged to any of our correspondents who may have tried this plan, if they would favour us with their opinions upon the subject.

F. G.—We would not advise you to leave more than 15 or 16 bunches on your Vine, if you wish to have them of a good quality. If you cannot easily procure gypsum, your best method for preparing night-soil will be to use powdered green vitriol or weak oil of vitriol. The manure will then be ready for use in a few days.

John Thorn.—The plant sold in Covent-garden under the name of the Lady's Cushion is the Saxifraga hypnoides. The Rosa Eglanteria is the Austrian Rose; it has not powerful thorns, and will not be suitable for forming a hedge. The best for your purpose will be the Dog Rose, and its varieties; but Rosa ferox has the strongest thorns of any known species.

A. B.—If you wish to have neat and clean Apricot-trees, you must remove all fore-right shoots, as in Peaches and Nectarines. Spurs look very unsightly, even in Pear-trees, and should never be left on any but old trees, which have always been pruned after that fashion, and which it would be in vain now to alter. The best treatment of Greenhouse Aza'leas, after they have flowered, is to pick all the blooms off, and repot them into sandy peat, with which a trifling portion of maiden loam may be mixed. At p. 284 of the *Chronicle* you will find further information upon this subject.

Q in a Corner says, "Will any of your correspondents have the kindness to tell me how to exterminate Black Beetles? My house is positively overrun by them, and the more we destroy the more numerous they seem to become. We have tried the common beetle-traps, vermilion wafers, hedgehogs, guinea-pigs, boiling water, and every other destructive remedy recommended, without effect. These last few warm nights have brought out millions of them, and as there appears in their ranks a great multitude of young ones, our prospect for the summer is not very agreeable. We are not sportsmen: if we were, *la Chasse aux escarbots* might promise much amusement. Joking apart—they are a very serious annoyance to the whole household, and any hints for their destruction will be most thankfully received."—The best information we can give upon this subject will be found at page 262 of the *Chronicle* for last year.

J. W. D. and *D. A., Clanmorie.*—It is our opinion that Dahlias of every colour will flower equally well in the same soil, providing that soil is suitable. As you have failed to produce fine blooms, this is our advice with regard to soil and situation, upon which their success in a great measure depends:—About the middle of May, when the danger of late spring frosts is over, select a situation not shaded by trees, but at the same time not too exposed, otherwise the wind will be very injurious to the blooms, by knocking them about and bruising them. If the soil is not tolerably good, procure some sandy loam from a fresh pasture; open the holes two feet square and about one in depth: fill them up with the fresh loam, and plant your Dahlias in them; then mulch round the plant with half-decomposed cow-dung, watering and staking them directly in the form of a trellis. Take great care afterwards that the stems and flowers are properly thinned out, and well secured to the stakes, as they advance in growth; and that the blooms are shaded from the sun, during the hottest hours of the day.

A. L. M.—Your plant is Dorónicum Pardalianches. The colour of your seedling Polyanthus is very rich, and we think it will prove a good variety.

E. T. O.—The Epidendrum you sent is a variety of Ep. variegatum.

Frutex.—There is no later edition of the Catalogue of Fruit Trees in the Horticultural Society's Garden than that of 1831; but one is in the press, and will soon appear.

J. C. L.—The four Oncídiums are all alike, and are On. carthaginense, var. luridum. The other is Cyrtopódium Andersónii.

C.—We consider it to be very injurious to plants to be constantly watering them with lime-water. The proportion of gypsum to be applied to different manures varies so much that it is impossible to fix any stated quantity. In applying it to night-soil, the best way is to keep adding it until the offensive odour is entirely gone.

Hibernia's plant evidently wants more water, or a larger pot. We know of no ready means for detecting adulteration in guano; when pure it is the colour of Scotch snuff. Petu'nia superba will live through the winter in a cold frame, with proper treatment. The flower of the Yellow Banksian Rose never attains more than an inch in diameter. The seeds of Rhodochiton volu'bile require a warm atmosphere to make them germinate. The Cock's-foot is a coarse grass, quite unfit for lawns. The Night-smelling Wallflower will not grow in the open air.

B. B.—The great objection to Chunk and Arnott Stoves for greenhouses or vineries, is that it is almost impossible to prevent the escape of smoke into the house, which is certain destruction to the young bunches of Grapes. Your allowing the smoke, therefore, to enter your Vinery, will have destroyed the crop for the present season; but with care, the Vines may do very well next year, as they will soon put forth fresh foliage, and lay up their necessary secretions. It is quite out of our power to determine what your plant is in its present young state.

G. F.—Your method of planting out Melons in wet soil is a bad one; the principal cause, however, of your fruit falling off is the want of sufficient heat in your ridge during the late cold nights. When your plants have acquired more strength, and the nights become warmer, you may expect to meet with more success.

A Poor Clerk.—Fuchsia splendens will grow in any tolerably rich soil, with the usual treatment of greenhouse plants. F. corymbiflora is not sufficiently hardy to stand out during the winter with no other protection than a few leaves. The following kinds will be suitable for planting out.—Fuchsia globosa major, Clintónia, Thompsónia, Riccartoni, grácilis, virgata, inflata, and grandiflora superba.

Omega.—We will attend to your suggestions; in the mean time we may inform you that we do not consider saucers with water in them at all necessary for the growth of plants, but they are convenient in rooms where the water would injure the tables or carpets.

A. B.—We recommend you a "Working Gardener's Memory-Sheet of Garden-work," for the price of which you must apply to the booksellers.

A Subscriber.—We give several lists of Climbers among these notices to-day. The leaves of Crocuses should never be cut off till they are brown; if, however, a gardener has destroyed the ends of them, that which is left is better than nothing. Ammonia from gas-works acts precisely as the ammonia in stable manure.

A Subscriber from the Commencement.—It is impossible for us to give any other than general ideas as to the arrangement of ground for a Flower-garden. The rule to be always observed is to let the beds in a formal flower-garden, as yours must be, take regular geometrical figures—squares, or ovals, or oblongs, or polygons, or such forms, and never to be in fancy shapes. The crinkum-crankums one sometimes sees never look well, and generally are particularly offensive to the eye of good taste. Your beds may be made on grass, and will look better so than if on gravel. A few large baskets, say 20ft. long, on slightly-raised rough brickwork, and constructed with rustic materials, would have a good effect, if well managed.

Alnus.—The Caca'lia articulata is seldom seen in flower; it evidently requires a warm dry situation, and might probably do well if planted out in front of a greenhouse in summer. If you keep it in a room, give it a south aspect, and place it near the window. None of the species are very ornamental; C. tomentosa and C. ficoides will do very well for a sitting-room, but are not to be compared to some of the Echevérias, Mammillárias, and the Mesembryanthemums for this purpose. If the buds in your Roses are alive they will soon begin to grow; you may assist them by bending slightly the branch above where the bud is inserted, and by syringing them every afternoon and evening.

Clew. Vic.—Some of the plants in your Conservatory may require different soils from others, but the best way will be to make up the bed in the centre with a mixture of three-fourths brown sandy peat and one of well-decayed leaf soil, and then when you plant, if this does not suit all the things, a proper soil can easily be made round such. The bed which is 10ft. 6in. long, by 3ft. 6in. in width, may be filled with Chorozema varium, Hóvea Celsi, Pimelea decussata and híspida, a double white Caméllia, and Acácia vestita. These will ultimately fill your bed; in the mean time you can plant any pretty little thing between them. As Creepers for the back you may take Mandevilla suavéolens (if you can plant it in the bed), Hardenbérgia macrophylla, Kennédya Marryattæ, and any of the half-hardy Passion-flowers. We believe Stephenson's boiler is well adapted for such a house; it is highly spoken of.

J. Abell will find some information upon the conversion of peat into manure in another column.

Gezer.—We can suggest no way of discharging ink from zinc labels. Sand-paper will, we presume, remove it. "Miller's Dictionary" is out of date, and Martyn's is a bad edition. The 8th edition of Miller is full of plain useful gardening information, but of course is deficient in what regards modern practice. Probably "M'Intosh's Practical Gardener" will suit you.

John M'Pherson.—We do not understand the meaning of your question.

W. H.—It is quite impossible to insert notices of Country Shows unless they are sent to us *early in the week.*

Tyro's Vines have yellow leaves, in consequence of his border being wet and cold. Nothing can prevent the disease except thorough drainage.

A. Tinsley.—Your seeds are the Cicer arietinum, or Chick Pea. It is of no value in this country.

A. Parsons.—Judging from the cut specimen of your Verbena, we should say it will be a very desirable variety. There are, however, others in the nurseries very like it, which have been raised from Verbena teucrioides.

H. Payne.—We have nothing to correct. The statement was perfectly true, as you *might* learn, if you knew where to inquire; and as you *will* learn, without inquiry, in course of time.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The overland mail, which reached town on Tuesday, brings the satisfactory intelligence that no new disaster has occurred in Affghanistan, and that a decisive effort will be made by the Indian Government to retrieve the previous reverses. Our troops still maintain their positions; Gen. Sale continues at Jellalabad, and has shown that he requires no immediate assistance by the repulse of Akhbar Khan, who had attacked the garrison with a considerable force. The other strongholds, Ghuznee, Khelat-i-Ghilzie, and Candahar, remain in the hands of the British; and the first great success of the Affghan chiefs, instead of serving as a bond of alliance, has proved a signal for their disunion. Schah Soojah appears to be in possession of sovereign power at Cabul; and there is no doubt that he acted with treachery during the late events. Gen. Pollock had not ventured to force the Khyber Pass, but was awaiting the reinforcements which were proceeding to his assistance, and with which he was expected to force the pass in the early part of April. These advices also bring the gratifying news that the disaster at Cabul was not so complete as at first represented; many officers and men have been heard of since the last accounts; some had made their way to Jellalabad, some to Peshawur, while many others were known to be alive in the hands of the enemy. From other parts of India the intelligence is not of great importance; tranquillity for the most part prevails, and the disturbances among the Madras Sepoys have been satisfactorily arranged. Lord Ellenborough has arrived at Calcutta, where he has been proclaimed Governor General with the usual formalities.—The news from China is satisfactory; our forces have captured, without loss on our side, three large towns in the neighbourhood of Ningpo, and Sir Henry Pottinger appears to be pursuing the course most likely to bring the war to a speedy termination, by rejecting all negotiations with inferior officers, and insisting on direct communication with the Emperor himself.—Our European news presents few points of leading interest; in France public attention has been occupied by the adjourned debates on the Railroad Bill, and by the ceremonies observed on the occasion of the King's fête.—From Madrid we learn that some animated debates have taken place in the Cortes in consequence of the Regent's signature having been inadvertently affixed to the contract for the Treasury bonds; the Opposition denounced this signature as unconstitutional, and poposed a vote of censure, which was negatived by a majority of 10. This result, although in favour of the Government, was regarded as a check, and some changes in the Ministry are considered probable.

At home, our news is confined to the proceedings of Parliament. In the Commons, a debate has taken place on a Chartist petition, signed by upwards of three millions of persons, in favour of the five points of the Charter; after a long debate, the House rejected, by a majority of 238, the motion that the delegates be heard at the bar in support of the objects of this petition. The Income-Tax Bill has made some progress; and though several amendments have been proposed, the original clauses of the Bill have thus far passed without modification. The Exchequer Bills Bill has been read a third time and passed; and some others of less public interest have been advanced through their several stages. The second reading of the Bill regulating the question of Patronage in the Church of Scotland has been postponed for six weeks, in consequence of the announcement of Ministers that they are in correspondence with the parties principally interested, and do not despair of effecting a satisfactory settlement of the questions at issue.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal continue well. The Queen honoured the Italian Opera with her presence on Saturday and Tuesday, and the French Plays on Wednesday evening. Her Majesty and Prince Albert visited the Queen Dowager at Marlborough House on Monday. The Queen held a levee at St. James's Palace on Wednesday, which was numerously attended. Her Majesty, accompanied by Prince Albert, the Prince of Wales, and the Princess Royal, left Buckingham Palace yesterday for Claremont, and will return to town on Tuesday next. On Wednesday Prince Albert presides at the anniversary dinner of the Literary Fund, and on Thursday the Queen will give a state ball at Buckingham Palace. Col. Arbuthnot has relieved Major-Gen. Wemyss in the duties of equerry in waiting on her Majesty, and Col. Wilde has succeeded Col. Bouverie as the equerry in waiting on Prince Albert. It is stated in the fashionable circles that her Majesty has appointed the Dowager Lady Lyttelton governess to the Princess Royal.

Official Appointments.—The Gazette announces the appointment of the Duke of Sussex to the office of Governor and Constable of Windsor Castle, in the room of the late Earl of Munster.—The Queen has appointed E. Howard Gibbon, Esq., Mowbray Herald of Arms Extraordinary.—The Ministerial papers announce that the Earl of Wicklow will receive the riband of the Order of St. Patrick, vacant by the death of Lord Shannon, and that the Earl of Bandon will succeed Lord Shannon as Lord Lieutenant of the County of Cork.

Parliamentary Movements.—The Nottingham Election Committee have decided that the sitting members, Sir J. C. Hobhouse, and Sir G. G. de Hochepied Larpent, were duly elected for that borough. The latter gentleman, however, has accepted the Chiltern Hundreds, and a writ has been issued for a new election.—The Thetford Election Committee have declared that the Earl of Euston was not duly elected for that borough, and that Sir J. Flower was elected and ought to have been returned.—Capt. Plumridge has been declared duly elected for the boroughs of Penryn and Falmouth; and the Dudley, Downpatrick, County of Kerry, Harwich, and Worcester Election Petitions have been abandoned. Lord Alfred Hervey has been returned for Brighton by a large majority.

Foreign.

France.—Among the leading topics of interest in the journals this week, is the announcement of the birth of a son to the Duke de Nemours, the second son of Louis-Philippe, which event took place on Saturday evening at the Palace of Neuilly. The Duchess and infant are doing well, and the young Prince is, agreeably to the wish of the King, to have the title of Count d'Eu.

The King's Fête.—Sunday, the 1st May, being the King's *fête*, a levee was held at the Tuileries, at which the diplomatic body, the Presidents of both Chambers, and the authorities were admitted to present their respects to his Majesty. On the preceding evening the Archbishop of Paris, accompanied by his clergy, was received by the Royal Family. The Prelate, after congratulating the King and Queen on the birth of the Count d'Eu, referred with satisfaction to the religious re-action evidenced at the recent solemnities of Lent and Easter, which he partly ascribed to the example set by the Queen. He then spoke of his hopes for the future. "We trust," said he, "in the pledges which your Majesty has given to the church by the choice of pious pontiffs; in the assurances which you have deigned to give to us more than once of your zeal for religion and your firm determination to protect it. Confident in your royal word, we trust that at no distant period it will be possible for your Government to put an end to public labour on the days consecrated to God, and that, influenced by this powerful example, these sacred days will be respected by all Frenchmen." This address has excited great attention in the capital. The *Moniteur* does not publish it at all, the *Journal des Débats* criticises it with some severity, and the opposition papers bestow unqualified censure on it, as "a highly improper manifestation." The Royalist prints, on the contrary, approve of the address, as the desecration of the Sabbath was an admitted evil. Next to the congratulations of the clergy, those of the diplomatic corps merit most attention. The Marquis de Brignole Sale, as senior Ambassador, in his address, observed that "The diplomatic body, which is a faithful organ of the Sovereigns whom it has the honour of representing, is certain of expressing their real sentiments, Sire, when they assure you of the wishes which they form for your happiness, and of the satisfaction they feel in beholding France tranquil and prosperous under the reign of your Majesty. Those results, everybody must confess, are due to your wisdom. They are the more precious, as they mainly contribute to maintain harmony and confidence between the Cabinets, and thus become one of the strongest guarantees of peace, which it is the interest as well as the wish of all to perpetuate as long as possible." The King replied, "It is very grateful for me to receive, through your organ, in the name of the diplomatic body, the expression of sentiments so analogous to those I myself entertain for the Sovereigns whom you represent. Deplorable passions are still vainly striving to shake confidence in futurity, and create alarm respecting the duration of that good harmony which insures the prosperity of nations. The expressions which you have addressed to me are well calculated to dissipate those alarms, and to prove that the peace of the world rests on a solid foundation." The other addresses offer no passages of particular interest. The *fête* was unfortunately ushered in by rain, which continued till the middle of the day; the weather, however, then cleared up, and the public rejoicings passed off satisfactorily.

The Chambers.—The Chamber of Deputies has been occupied with the adjourned debate on the Railroad Bill. The general discussion having closed, after several days' sitting, the Chamber proceeded to consider the various articles of the project of law. A number of amendments were proposed on the different clauses, which gave rise to an animated discussion. It, however, terminated by the Chamber deciding—1st. that a railroad should be constructed from Paris to Belgium, through Lille and Valenciennes. 2. That a line of railroad should be made from Paris to a point on the coast of the Channel, to be hereafter determined. 3. A railroad from Paris to Strasburg through Nancy. On Saturday, the discussion was resumed on the line extending from Marseilles to Avignon, and a spirited debate ensued as to whether it should pass by the Valley of the Rhone or that of the Durance. The question was ultimately decided in favour of the former, after a powerful speech from M. de Lamartine in support of the line through Arles and the Valley of the Rhone, which is said to have had considerable influence on the decision of the Chamber. Upon the clause of the line to this country, an interesting debate took place; M. Royer moving that it should be expressed by "Boulogne, Calais, and Dunkirk," and M. Berryer proposing by "Boulogne and Calais." M. Teste, Minister of the Interior, opposed these two amendments, because he did not consider that Government was in possession of sufficient data to establish any terminus at present. M. Berryer, in reply, warmly vindicated the important advantages to be derived from the communication with England, and argued that no doubt ought to be allowed to exist as to this line at all events. M. Legrand maintained that the wording of the paragraph was a sufficient guarantee to every interest, and the amendments were then rejected, and the original clause carried. In the course of the debate considerable sensation was produced by the introduction of a project of law by the Minister, M. Teste, to prolong the Rouen Railroad to Havre, on the offers of C. Laffitte and Co., and the British capitalists, now executing the Rouen and Paris line. The Bill proposes a loan of ten millions of francs to the company, at three per cent. interest, besides a gratuitous subsidy of eight millions of francs; the loan to be paid off the tenth year after the completion of the railroad, by a fortieth part yearly. On Monday the Chamber voted the paragraph authorising the construction of a railroad from Paris to Bayonne, through Tours, Poictiers, Angoulême, Bordeaux, and Bayonne. The continuation of the line from Bordeaux to Bayonne was opposed by M. Teste, Minister of Public Works, on the part of Government; but it was, notwithstanding, adopted by a considerable majority. This vote is considered by the Opposition journals as a Ministerial defeat. On Tuesday there was a contest between the company of the Orleans line and those of the Versailles roads, which should continue on to Nantes. The Orleans company, however, carried their point, being the most powerful in the Chamber, and the line between Paris and Nantes is to run along the Loire, instead of proceeding by Chartres and Le Mans. The same interest carried the vote of a central railroad from Orleans to Clermont, by Bourges and Nevers.

The Capital.—The funeral of M. Humann took place on Saturday, attended with considerable pomp and ceremony. The remains of the ex-minister were removed in great state to the Church of the Madeleine; and the first sacred service that has taken place in that edifice was performed on this occasion. All the Ministers, Officers of State, and deputations from both Chambers, were present at the ceremony, and the military staff of the garrison was also called out. The pall was supported by four of M. Humann's Colleagues in the Cabinet, M. Guizot, Marshal Soult, Admiral Duperré, and M. Martin (du Nord). On reaching the principal façade, the coffin was taken from the hearse and carried to the gate, where it was received by the Archbishop of Paris and his clergy, and thence conveyed to a rich catafalque, in the centre of the church. Mass was then performed by the parish-priest of the Assumption, and the absolution was given by the Archbishop. After divine service, the body was transferred to a vault, where it was to remain until the necessary preparations for its removal to Alsace could be completed. The total absence of the National Guard from the ceremony had excited some surprise. Marshal Soult was slightly indisposed during the funeral, and was obliged to retire before the close of the ceremony. His illness is said to have been occasioned by exposure to the heat, but it has not led to any serious consequences, and the Marshal has since quite recovered from its effects.—The King gave a grand dinner on Friday to the garrison of Vincennes, on the occasion of his son, the Duke de Montpensier's, admission into the army as an Artillery officer.

Spain.—Our intelligence from Madrid is to the 25th ult. There have been some animated debates in the Cortes relative to a signature affixed by the Regent to the contract for the capitalisation of the interest of the debt with Señors Heredea and Salamanca; the Opposition Deputies contending that this was a most unconstitutional course. In the sittings of the 22d ult. a motion was made, demanding that the Regent's signature should be declared null and void. The Ministry did not defend the act impugned by the Opposition, but Señor Surra y Rull, Minister of Finance, took on himself the entire blame of the transaction, explaining that the contractors had not required this signature, which had arisen from his having inadvertently put into a portfolio a paper with others which the Regent had to sign, and that his colleagues had nothing to do with it. These excuses of the Minister, given under strong emotion, were favourably received by the Deputies; but a sudden tumult arose, in consequence of Señor Lujan, a friend of the Cabinet, attempting to introduce a motion that the Chamber should take no further notice of the question at issue. The Chamber would not listen to the proposition, and Señor Lujan was obliged to withdraw it. All the Ministers then rose successively, and claimed to bear their share in any vote of censure that might be passed on their colleague, the Minister of Finance. After a stormy debate, during which the Minister of War declared that "the explanations given by the Ministry were sufficient to satisfy all but those who carried narrow heads and bad hearts," the motion was rejected by 82 to 72, giving the Ministers a majority of 10. At the sitting of the Cortes on the 23d, the Minister of Finance announced to the Chamber that the Regent had issued an ordinance declaring that his signature, which had been affixed to this treaty, should be considered as null and void. Señor Lopez took the occasion to make another strong attack on the Cabinet; and a second vote was taken, but his motion was rejected by 91 against 59. In consequence of this affair, and the check given to the Ministry, expectations appear to have been entertained of a modification of the Cabinet; and a conference which M. Olozaga, the leader of the Opposition, had with the Regent on the 23d ult., had given strength to the rumour. There appears, however, to be no foundation for the report; and private accounts state that no change is to be apprehended at present, and that the Regent will dissolve the Cortes rather than part with his Ministry. The journals state that the Infant Don Francisco de Paula, whose prolonged residence in the capital appears to have given umbrage to Government, had been informed that it was time for him to proceed to Aranjuez and Seville; and that this notification was accompanied by a remittance of the funds necessary for his journey. It does not appear, however, that he has yet left Madrid. The cotton question was not expected to be brought forward in the course of the present session, in consequence, as is stated, of M. Surra y Rull, Minister of Finance, who is a native of Catalonia, and a deputy from that province, constantly raising difficulties on the subject, in order to gain time; though the majority of the Cabinet are said to be of opinion that the question should be immediately adjusted. The advices from Andalusia state that great damage had been done to the vines, olives, and grain crops, by the high and dry winds which have lately prevailed, causing a scarcity of water and provisions. Subsequent intelligence has been received to the 27th ult. It confirms the previous information as to the continuance in office of the Gonzales Cabinet, supported as it was by the confidence of the Regent. In Congress, on that day, the Ministry obtained a majority of 86 against 73 on the Bill for the issuing of 160 millions of reals in Treasury bills.

Portugal.—We have received intelligence from Lisbon to the 25th ult. The negotiations respecting the treaty of commerce were temporarily suspended, Lord Howard having had to refer home for the opinion of his Government on a clause proposed by the Duke of Palmella, that in case the reduction of duties contemplated to be conceded by England to Portugal, in the tariff convention, should be afterwards extended to any other power, Portugal should have the option of placing everything again on the same footing as at present. It is understood that the duty on Portuguese wines would be reduced from 5*s*. 6*d*. to 2*s*. 6*d*. per gallon; that on brandy from 21*s*. 6*d*. to 10*s*.; and Portuguuese fruit, which now pays 7*s*. 6*d*.

per chest, would be admitted at the merely nominal duty of 1*s*. per chest.—The slave-trade treaty remained unsettled, on account of the Portuguese requiring the insertion of a clause tending to limit the duration of the power of search by England under the treaty, which had not hitherto been put in such a shape as to justify the British plenipotentiary in acceding to it. Baron Lagos's plan of conversion had been rejected by the Council of State, but its advocates appear still disposed to press it forward. The golden rose had been presented by Monsignor Vizzardelli to the Queen, on the part of the Pope, and the delegate had received the commandership of the Order of Christ, and a gold snuff-box set with brilliants, in return. The Kite, British war-steamer, had put into Lisbon on her way to Sierra Leone, to order home the vessels of the Niger expedition.

GERMANY.—Our German intelligence does not possess much political interest. Private accounts from Vienna state that the railroads are to be urged on as much as possible; and that fifty-six engineers, forming eight sections, had set out for the north and south, to lay down the lines from Vienna to the Saxon frontier and to Trieste. Two months will, it is said, suffice for the completion of these preparatory labours, and the works are to commence in August; but the idea of employing soldiers is said to be abandoned. It is calculated that the Vienna and Trieste railroad will be completed in six years.—The accounts from Berlin respecting the illness of the ex-King of Holland report favourably of his Majesty's progress, and state that his situation is improving in every respect. It is said that the Minister Eichhorn has sent an order to the synod of the clergy of Berlin to abstain from all discussions about the bishopric of Jerusalem, the affairs of which do not at all concern them.—Private letters received from Stuttgardt, dated the 21st ult., state that that city has lately been visited by a great number of persons of high rank, curious in fire-arms—not only Germans, but foreigners, particularly English, for the purpose of being present at the sale of the late Duke Henri de Wurtemberg's valuable collection of guns and pistols, containing a complete series of the various sorts that have existed since 1650 to the present day from the workshops of the most celebrated makers in Europe. There are also several articles which present an historical interest from having belonged to celebrated personages, such as Louis XIV., Charles XII., Turenne, the Duke of Alba, Prince Eugene, Napoleon, &c. Other objects are considered valuable from the curious carvings, and incrustations of gold, silver, ivory, and mother of pearl on them, and from their ornaments in precious stones. The whole collection is valued at 400,000 florins.

HANOVER.—A report, which has been some time current, as to the marriage of the Crown Prince with the Princess Mary of Altenburg, appears to obtain general credence; and private accounts add, that little doubt is entertained of the fact, though no official notice has been published, which is not expected before the expiration of the year's mourning for the late Queen, who died on the 29th June last year.

RUSSIA.—Private letters from Moscow, dated the 12th ult., state that a famous Norwegian runner, Mensen Ernst, who had been there a fortnight, and who arrived on foot from Stockholm, has engaged to walk from that city to Jerusalem in 30 days. Several Russian noblemen have made wagers, amounting to 80,000 silver roubles (320,000f.) His departure was to take place on the 1st instant; and he is to receive 25,000 silver roubles if he succeeds in his undertaking.

TURKEY.—Our intelligence from Constantinople, which is to the 17th ult., is not important. Accounts had been received from Beyrout, dated the 10th ult., bringing unsatisfactory news of the state of the Lebanon. Several Druse chiefs had been seized and put on board a Turkish steamer, off Beyrout, in order to be sent to Constantinople. The Druse population had become alarmed, and were arming; but no collision had yet taken place with the Turkish troops, and it was thought that the seizure of the leaders would render the people powerless. It is said that the Turks still show themselves inimical to British subjects and interests, in consequence of orders from Constantinople, and matters, it is feared, will not assume a more friendly aspect while Izzet Mohammed Pacha is at the head of affairs in Syria. The late accounts of the ill-treatment of Bishop Alexander and his suite at Jerusalem are said to be wholly unfounded.

EGYPT.—From Alexandria our advices extend to the 16th ult., but they bring no political news. The Pacha was still in the Delta, and, according to the last accounts, at Kaffer Shiek. The greater part of the troops had just marched out of Alexandria, to assist in clearing out the Mahmoudyeh canal, which has become shoally in many parts, particularly at the end near Atfé; and in addition to the troops, there was to be an impressment of the villagers from the neighbouring districts, to assist in the same work. Some interruption to the transit of the canal would in consequence take place, which would prove inconvenient to the passengers passing between Alexandria and Suez, the Indian mails coming by land at that part. Nothing political had transpired of late. A steamer arrived on the 14th from Constantinople, bringing despatches from Sami Pacha to his Highness. The negotiations at the Porte are about tribute and arrears, and the expenses of the war, which last are not mentioned in the firman issued for the restoration of Mehemet Ali.

INDIA.—An extraordinary express reached town on Tuesday, announcing the arrival of the Overland Mail at Marseilles. The intelligence thus brought, though not of great importance, is to a certain extent satisfactory, as it conveys the assurance that no fresh disaster has occurred in Affghanistan. Our news extends to the 18th Feb. from Candahar, to the 21st from Jellalabad, and to the 28th of the same month from Peshawur. Sir Robert Sale maintains his position at Jellalabad, and Gen. Nott at Candahar; while Gen. Pollock was waiting for reinforcements, which were daily expected, to force the Khyber Pass, and relieve Sir R. Sale. A report had reached Bombay that two of the Bengal Native Regiments had positively refused to enter the Khyber Pass; that they were aware of the massacre of our troops at Cabul, and would not incur the same risk. The report adds that Gen. Pollock had sent for reinforcements of Européans, under the supposition that where there are European soldiers to lead, the native troops would follow. Private letters state that the troops of Gen. Pollock are animated by a burning zeal to attack the Affghans. The women of the 44th went into the 3d Dragoon camp and implored the men to revenge their murdered husbands, which they have vowed to do. The scene is said to have been a heartrending one. Shah Soojah remains at Cabul; and at Ghuznee and Khelat-i-Ghilzie our troops were guarding still the same position. The only collision that has occurred since the destruction of the Cabul army, has been a comparatively insignificant one at Jellalabad. On the 15th Feb. Akbar Khan encamped with about 2,000 men on the bank of the river opposite to Jellalabad. Gen. Sale, however, feared nothing from his approach, as he had recently added considerably to his stock of provisions, and the walls of the fortress were in good order, and the ditch around them completed. A few days after the encampment of the rebel chief, an earthquake occurred, which was likewise felt severely at Peshawur, Meerut, and other places, and shook down two of the bastions, and some portion of the walls. The buildings in the town sustained considerable damage, and some of them fell to pieces. Gen. Sale, Col. Monteath, and Capt. M'Gregor are stated, among others, to have had very narrow escapes. Akbar Khan, on perceiving the defenceless condition of the fortress, at once marched to the attack; but he was repulsed without great difficulty. It is stated to have been a short and bloody conflict; the garrison lost, in killed and wounded, only two grass-cutters and twelve men; but the enemy's loss could not be numbered. The damages done by the earthquake by no means dispirited the garrison, and they were soon actively engaged in the work of reparation. There had been no further collision up to the 4th March, the date of the last advices. About this time, treasure, amounting to 3,000 rupees, which had been despatched on the requisition of Gen. Sale, who was much in want of money, arrived in safety. The conduct of Shah Soojah appears to be extremely suspicious; and the information regarding his proceedings is by no means explicit. It seems that on the 28th Jan. a council was held at Jellalabad to take into consideration some proposals made to Gen. Sale by his Affghan Majesty. The terms of these did not transpire, but it was known that the matter was referred back again to Cabul. One letter states that the Shah wrote "inquiring what the views of Sir R. Sale might be, and affirming that he would not be able to keep his followers much longer quiet, and that if he received no assistance he must retire to Loodianah." Some accounts represent him as asking for money, and saying that he had "no need of troops;" while others represent him as having purchased back his forfeited life and crown by renouncing our alliance, and admitting the chiefs to his councils. He is said to have urged the Maharajah to preserve a strict neutrality in "the approaching collision between the Affghans and British," in order that, being rendered powerless, we might be finally destroyed. Akbar Khan also had requested his assistance in the projected attack on Jellalabad, which he refused, because that chief had not yet tendered his allegiance. All these statements, however, are mere rumours, which appear to require confirmation; but it seems certain that Akbar Khan is now acting on his own behalf, and has no connexion with the confederated chiefs in Cabul. Our latest accounts from this city extend to the 15th Feb., at which time all the prisoners there were in good health, and well treated. Major Paton, the deputy quartermaster-general, who was supposed to have fallen, is, it appears, alive and well; he had lost an arm, however, in action, on the 28th Dec. Three officers, Major Sevayne of the 5th Native Infantry, Capt. Bott of the 5th Cavalry, and Dr. Magrath of the 37th Native Infantry, who were all supposed to have fallen, are reported to have been ransomed from the Affghans, and Lieut. Souter of her Majesty's 44th, who was in confinement at a place called Futoo, has, it appears, made his escape, and reached Peshawur. Col. Chambers, Capts. Blair and Hamilton, of the 5th Cavalry, Capt. W. Grant of the 27th Native Infantry, and Capts. Miles and Bygrove of the 5th N. I., have also been heard of; they are in the enemy's hands, and imprisoned in some fort near Jellalabad. The name of a Capt. Martin is also mentioned, but no such officer appears to have been present with the Cabul army. Very few communications from the other prisoners have been received either at Peshawur or Jellalabad; but it does not appear that they have been ill-treated. Jubber Khan is said to have obtained possession of the child alleged to have been sold in the Cabul bazaar, and it is now safe. Besides the officers whose escape is above noticed, the sergeant-major of the 37th regiment, several soldiers both European and native, some camp followers, &c., have arrived in safety. The accounts given by these fugitives of the late events, although imperfect, all point, it is said, to Akbar Khan as the contriver of the scheme by which our army was destroyed. We have no particulars of the state of affairs at Khelat-i-Ghilzie, but the latest letters received from its garrison state that all is well with them. Ghuznee is well supplied with provisions, and no apprehensions appear to be entertained of an attack. A report that the rebels were busy mining this place at one time prevailed, but the alarm was groundless. The Affghans are collected in force near Candahar, and by the last accounts from that place, Gen. Nott was preparing to move out against them with from ten to twelve thousand men. It is expected that this force will speedily defeat the insurgents in its vicinity, after which it will move on to the relief of Ghuznee, and ultimately to Cabul. From the other parts of India the intelligence is not important. Scinde was quiet; and Burmah offers no news of interest. The disturbances caused by the mutiny of the Madras Sepoys have terminated, and all is tranquil in those districts. There are symptoms of confusion being likely to break out at Oude, where the old King is said to be acting the oppressor, at the instigation of his minister. Lord Ellenborough, who reached Calcutta on Feb. 28, was immediately proclaimed Governor-General, and Lord Auckland had left for England.

CHINA.—Our news extends to the 14th Feb., and is on the whole satisfactory. The principal objects effected by the expedition since our last advices have been the capture and occupation of three towns, Yapao, Tsikek, and Fungheva, in a circle embracing 20 to 40 miles from Ningpo. These events took place between the 27th Dec. and 12th Jan. It appears that the Chinese had been throwing garrisons into these places, for the purpose of intimidating the inhabitants of the adjacent districts, and preventing them from furnishing supplies to the British forces in Ningpo. It was therefore determined by the Naval and Military Commanders-in-Chief to dislodge the Chinese troops, which was effected without any loss on the part of the English. Mr. Lock, a midshipman of the Blenheim, was the only person at all injured during the whole series of operations, and he suffered only a slight contusion on the foot from a spent ginjal ball. Sir H. Pottinger, who arrived at Hong Kong on the 1st Feb., had abandoned the intention of attacking Canton. He was then concentrating all his forces, with the view of directing them on Pekin, and had refused to negotiate with the Commissioners sent to him by the Emperor, declaring his determination not to treat but with the Sovereign directly. Sir Henry had decided on discontinuing the seizure of junks in the Canton river, and had given directions accordingly. He had also determined on discharging the transports, and placing the troops in the barracks building at Hong-Kong for their reception. All was quiet at Amoy; the troops have not been in any way disturbed in their occupation of Koo-lung-soo, and the inhabitants generally appear well disposed towards them. The Mandarins have tàken some European sailors into their service, at fifty dollars a month, for the purpose of teaching the Chinese soldiers the gun exercise. The commander of a French frigate, Erigone, had been to Canton, where he was well received by the authorities, and enjoyed, it is said, the honour of an interview with the Viceroy and other great men.

UNITED STATES.—We have had three arrivals at Liverpool from New York this week, the Susquehanna, Independence, and Virginian packet ships. The advices thus brought are to the 14th ult. H. M. S. Warspite, having Lord Ashburton on board, arrived in Annapolis roads on the 2nd ult., and fired a salute. The arrival of an English frigate with a special Minister on board had caused a sensation at Baltimore. His Lordship at once proceeded to Washington, where he has had an interview with the President, and has been introduced to both Houses of the Legislature. The journals notice the movements of Lord Ashburton in the capital, but give no information of the nature of the communications which have taken place between him and the Government. The prevalent opinion at Washington seems, however, to have been, at the date of the last accounts, that the mission would lead to satisfactory results. With respect to the disputed territory, the Governor of Maine intended, it was said, to convoke an extra session of the Legislature, in order to take into consideration the propositions of which Lord Ashburton was understood to be the bearer, for an equitable adjustment of the dispute. His Lordship is described as being in excellent health. Hogan, whose arrest on a charge of having been concerned in the Caroline affair took place a few months ago, and who was discharged in consequence of an informality in the warrant, has again fallen into the hands of the Americans. He was arrested at Rochester, and examined before the police justice, the examination lasting five days. The evidence was nearly the same as that adduced upon the trial of Mr. Macleod, except that a Dr. M'Kenzie deposed, that in a conversation he held with Hogan, the latter narrated to him the planning of the destruction of the Caroline, and stated that he was one of the party. The Court finally decided that the warrant upon which he was arrested being granted in a different State to that in which the offence was committed, he must be set at liberty. He went to the National Hotel, where a constable remained with him for protection, until he could be got away to Canada. The Loan Bill had passed the House of Representatives, had been read twice in the Senate, and it seems to be considered certain that it will be read the third time and passed. The amendment authorising the sale of a 6 per cent. stock, upon the best terms to be obtained, was expected to bring the money, which, without it, could not have been obtained while the Land Bill remains unrepealed. The stock is to be issued, as may be agreed on at the time of issuing it, either redeemable after six months' notice by the Treasury, or for any period of years not exceeding 20, from the 1st Jan. next. The stock may also, if desired, be made transferable by delivery, instead of by assignment. The whole amount authorised to be borrowed is 12,000,000 dollars. The Committee on Manufactures have presented a report to the House on the tariff. The report recommends, or rather lays, a duty on woollens of 40 per cent. ad valorem; on coarse goods, 30 per cent.; on fine goods, a specific duty; on rolled or English iron, 25 dollars per ton; on hammered, or Swedish iron, 17 dollars; pig metal, 88 dollars per ton; coal, 1 dollar 60c. per ton.

CANADA.—Our advices this week bring no intelligence of importance. Sir Charles Bagot has, by proclamation, further prorogued Parliament till the 10th May, and then not to meet for the despatch of business.

WEST INDIES AND SOUTH AMERICA.—We have received Jamaica papers to the 5th March. The prospects of the sugar crop are represented as favourable, but those of coffee are less so. The planters have been seriously interrupted in their operations by strikes among the negroes for higher wages. British ships of war, arrived at Kingston from New Granada, had brought intelligence of the complete restoration of tranquillity in that republic. —Advices have been received from Buenos Ayres to the 9th Feb. There had been a severe battle in the interior between the Monte Videans and the Buenos Ayreans, which had resulted in favour of the former.

Parliament.

HOUSE OF LORDS.

Monday.—After the presentation of petitions, Lord DENMAN withdrew his motion for the second reading of the Baptists' Affirmation Bill, that he might have time to frame a measure which would include in its exemption the members of other religious sects who had conscientious objections to taking an oath.

Lord BROUGHAM, in pursuance of notice, then moved that a message should be sent to the House of Commons for copies of any reports that had been made by Election Committees, with the view of obtaining information which would the better enable their Lordships to consider the state of the bribery laws, and the practices which had grown out of their constant violation. He then, after briefly noticing the cases of Sudbury and Ipswich, and deprecating the hasty disfranchisement of these boroughs upon the mere recommendation of the committees, proceeded to pass in review all the legislation of the last eight years on the subject of frauds at elections, and animadverted with severity upon the system under which the committees were at present constituted —a system, he said, according to which the judges of each court were of absolute necessity more or less parties to the case they sat to decide. He called upon those who had weight with the other House to put an end to this anomaly, and upon their Lordships, as the guardians of the purity of Parliament, further to prosecute the inquiry which their committees had entered upon.

The LORD CHANCELLOR apprehended that the application would be evaded by the House of Commons, who might consider such a message an interference with their privileges; and Lord Brougham accordingly withdrew his motion.

The Earl of WICKLOW observed that measures might probably be sent up from the other House which would render the information sought by the noble and learned Lord necessary to that House; and in that case he hoped he would renew his motion.

Viscount CANTERBURY explained the principles on which the House of Commons would probably act in the case of such an application being made to it. He concurred in the propriety of postponing the application until the information should be required as a ground of legislation; and when necessary for this purpose, he had no doubt it would be cheerfully afforded.

Tuesday.—The Soap Duties Bill passed through committee, and was ordered to be read a third time on Friday. Several petitions were presented, among which was one, presented by Lord Brougham, signed by the President of the Provisional Council of the National Complete Suffrage Union, Mr. Sturge. This body was composed of 100 delegates from a great meeting held at Birmingham. He moved that it be read at the table. The petition, which was in substance the same as that presented in the other House by Mr. T. Duncombe, was then read by the clerk.

The LORD CHANCELLOR, in reply to questions from Lord Campbell, said that the Lunacy Bill had been read a first and second time, and it now stood for committal, and he intended that it should be committed on Monday. The Bankrupt Law had been read a first and second time, and he should move that that also be committed next week. With respect to the Local Courts Bill, so many conflicting interests were to be reconciled, that although the Bill was ready, he could only hope that it would be proceeded with immediately after the recess. The Ecclesiastical Courts Bill was prepared, but it was thought that it should be introduced in the other House.

Friday.—After some conversation on the employment of young children in collieries, Lord BROUGHAM brought forward his measure for the regulation of Election Committees, and proposed the appointment of a committee of either House to take evidence on the subject. After a discussion of a somewhat personal character, between the Marquis of Normanby and the Marquis of Londonderry, on the appointment of Magistrates, the House adjourned.

HOUSE OF COMMONS.

Saturday.—The House met at 2 o'clock, to consider a motion made on Friday night by Mr. Thesiger, with a view to the discharge of Mr. Mabson, who was in custody under the order of the Southampton Election Committee. Mr. THESIGER, in bringing forward his motion, spoke at some length. He said he should wave the consideration as to the conduct of the witness before the committee, and would merely call the attention of the House to the validity of the proceedings under which the alleged contempt arose. He wished to point out the view he had taken, after the most anxious consideration, of the warrant under which this party had been supposed to be compelled to attend before a committee of the House, assembling in the present session of Parliament, and which, he contended, was not a valid warrant for that purpose, since it was issued by the Speaker for the last, and not the present session. There could not, therefore, be a contempt committed by the witness refusing to produce papers which were specified in the warrant. Mr. Thesiger concluded by moving that Mr. Mabson be forthwith discharged.

Mr. WYNN seconded the motion, and several members spoke on the subject, all being of opinion that as the validity of the Speaker's warrant, for disobedience to which he had been committed, was doubtful, the prisoner ought forthwith to be discharged. The motion of Mr. Thesiger to that effect, and a subsequent motion that the witness be ordered to attend the committee on Monday, were then carried without a division. In the course of the debate, an angry discussion arose relative to the proceedings of the Southampton Election Committee, between Mr. Ferrand and Mr. Hutt, which terminated by the latter gentleman being called to order by the Chair.

Monday.—The Reading Election Committee reported that the sitting members, Charles Russell, Esq., and Vicount Chelsea, had been duly elected.

The Lords' amendments to the Severn Navigation Bill were agreed to, and the Bill passed. The St. Philip's (Bristol) Bridge Bill, and the Gosport Pier Bill, were read a third time and passed. The Stourbridge Roads Bill was read a second time, and ordered to be committed.

Mr. T. DUNCOMBE presented the Chartist petition signed by upwards of three million persons. The petition, which, on being unrolled to admit of its entrance through the doorway, covered the floor of the House, consisted of upwards of 100 clauses, detailing various grievances and distresses of the people. It complained of taxation, and particularly of the national debt; of the contrast between the luxury of the rich and the poverty of the working classes; of the existing restrictions on popular meetings, the police, and the standing army. It called in question the necessity of an Established Church, the expenses of a Royal family, and complained of the general monopoly of property. But the principal subject of the petition was on the present state of the representation, and to this the remedial measures asked for are especially addressed, viz: Ballot, universal suffrage, annual parliaments, stipendiary Members of Parliament, a division of the country into equal electoral districts, and the repeal of the union with Ireland. The petition having been read at length, Mr. Duncombe said that he should bring the petition under the consideration of the House on Tuesday, and moved that it be printed with the votes, which was ordered.

The SPEAKER informed the House that the petition against the return for the borough of Dudley had been abandoned.

The House having resolved itself into committee on the Income Tax Bill, Mr. HUME took the occasion of the fourth section to make some animadversions upon the constitution and functions of the Land-tax Commissioners, who, he thought, should not be intrusted with the appointment of the commissioners for the purpose of this act. He disclaimed all desire to interpose unnecessary delay.

Sir R. PEEL defended the arrangement, and observed that if the office of Commissioners of Land-tax required alteration, such alteration was required with reference to other matters as well as to the income-tax; but that an alteration so general could not fitly be made in a temporary enactment like the present.

Many clauses of the bill were then successively passed without debate. On the 23rd Mr. ROEBUCK said, he should have preferred to let each man make his own return on oath. He thought that by that plan people's vanity would be called into action, and so they would often be willing to pay even more than they were strictly liable for.

Sir R. PEEL doubted whether, if he took such a course with such an object, he might not be deemed an accessory to the delusion intended by the parties thus swelling their returns.

The bill proceeded without discussion upon any of its provisions, until the enactment regulating the time at which the payments of the tax are to begin, when a long and desultory conversation took place on the clause which imposes the tax on all dividends and shares of the amount specified, which are payable after the 5th of April, 1842. Mr. HUME moved as an amendment that when such dividend or share shall accrue half-yearly or yearly, it shall only pay the tax on such an amount of the dividend or share as may have accrued after the 5th April, 1842.

The CHANCELLOR of the EXCHEQUER opposed the amendment on the ground of the public inconvenience that would arise from adopting it. The committee then divided, when there appeared, —For the amendment, 85; against it, 159; majority against the amendment, 74. In the second branch of schedule C, exempting stock in the names of trustees applicable to the repairs of any cathedral, college, church, or chapel, it was proposed to add the words "or other place of worship." The Chancellor of the Exchequer promised to consider the principle of this suggestion.

Mr. BARING then moved a clause exempting the dividends of foreigners not resident in her Majesty's dominions—a species of income which he thought it a breach of public faith to touch. The whole annual amount to be drawn from that source was only about 10,000*l.* a-year. Mr. Pitt had not thought it necessary to exempt British fundholders, because, having a right to call upon them personally, he had a right also to take their property where he could find it; but Mr. Pitt, feeling that he had no right to call personally upon foreigners not resident in the British dominions, did not think himself justified in taxing their funded property, after the pledge given by Parliament that the funds should not be the subject of taxation. Mr. Baring concluded by beseeching the House to lean to the side of faith, and to consider that the foreigners were unrepresented and helpless in the British Parliament.

Mr. GOULBURN said, that if he conceived the matter to imply a breach of faith, he would not rise to defend it. He considered, however, that when foreigners placed their property in the British funds, they obtained all the advantages of British security and prosperity, and ought to contribute to those objects in proportion with the other possessors of British property.

Mr. LABOUCHERE protested against the doctrines of Government in this matter, and hoped they would re-consider their opinions. He read the names of several leading merchants of London subscribed to a petition praying for this exemption, and he alluded to the danger that the United States might follow out a bad example, to the prejudice of our own fellow-subjects possessing property in the American funds.

Sir R. PEEL admitted that the sum in question was small, and that if it had been very large, it would not be worth taking at a risk of the public faith; but he thought the public faith by no means compromised. Whatever other property the foreigner might possess was taxable; why should his funded property be exempt? He could understand the argument against touching funded property at all; but if it was to be touched at all, there was nothing in any statute to protect the foreigner more than the British subject. The funds had been greatly raised by British exertion; surely all the public creditors ought to contribute alike to the common benefit. The foreigner might just as well ask an exemption for his railway shares. He believed the reasons which induced Mr. Pitt and Mr. Fox to exempt foreigners during the war, were reasons of prudence rather than of justice—reasons founded on the expediency of attracting to this country those capitals which, in the then precarious state of the world, were seeking some safe place of investment.

Mr. HUME saw no reason for exempting the foreigner rather than the British subject.—Mr. MASTERMAN briefly objected to the exemption; Mr. HAWES supported it. Mr. BARING replied, and the Committee divided: For Mr. Baring's amendment, 40; against it, 203; majority, 163.

The CHAIRMAN having reported progress, the House then resumed, and the other orders of the day were disposed of.

Tuesday.—Mr. C. WOOD presented the report of the Penryn and Falmouth election committee, declaring that Capt. Plumstead, the sitting Member, had been duly elected.

The Lords' amendments of the Ormsby Enclosure Bill were disagreed to, and a committee of conference was appointed, on the motion of Mr. WAKLEY.

Sir R. PEEL, in reply to a question from Mr. Hume, stated that Capt. Elliot is consul to Texas, but at present in this country, not receiving salary, his departure being delayed until he shall have completed certain explanations relating to transactions in Hong Kong.—Mr. HUME gave notice that he should submit, on an early day, whether Capt. Elliot, under present circumstances, is a proper person to be sent out.

Sir R. PEEL, in reply to a question from Mr. French, expressed his hope that the new Government of Portugal, in conformity with its assurances, would speedily provide for the payment of those claims of British officers which had been established by the mixed commission.

Mr. T. DUNCOMBE then rose, in pursuance of notice, to call the attention of the House to the "National Petition," presented by him on the preceding day. He quoted precedents in favour of the prayer of the petitioners to be heard at the bar of the House, in support of the allegations contained in the petition; gave a sketch of the history of Radical opinions, which he considered to be identical with what was called "Chartism" in the present day; and declared that, owing to the frustration of the Reform Act, the House was considered to be more profligate and more disposed to class-legislation than even the unreformed House of Commons. He said that those who had signed the petition amounted to nearly 3,500,000; that there were 600 bodies associated throughout the country to promote an agitation for the acquisition of those rights which they considered to have belonged to them under the old constitution of England, and to have been unjustly taken from them; and there were more than 100,000 persons now subscribing each a penny a week toward that agitation. He entered into particulars of the distress suffered in some of the manufacturing towns, and enlarged upon the extent and intensity of the feeling now prevalent among the operative classes in favour of Chartism. Could such a state of things continue? Would not the House at least consent to grant the hearing now prayed for? It would not occupy more than two days; but if it occupied ten, it ought to be permitted.

Mr. LEADER seconded the motion. The House, he was sure, could not doubt either the numbers or the sincerity of the petitioners. At all the public meetings held within the last 12 months the points most exciting to a great part of the audience had been those which bore any reference to Chartism. He concluded by pressing on the House the necessity of allowing the petitioners a hearing.—Dr. BOWRING thought that a petition more numerously signed than had ever been presented to the House was well entitled to consideration.—Mr. FIELDEN advocated the motion, and besought the House to hear what the petitioners had to say.—After some observations from Sir J. EASTHOPE, who, though he would not sanction the principles set forth by the petitioners, was still desirous that they should have a hearing,

Sir J. GRAHAM disclaimed all notion of treating the petition as a fit subject for ridicule; but the question was one of general policy, and he could not consent to hold out a hope which he knew would be unavailing. He therefore felt it his duty to resist the motion.

Mr. MACAULAY could not conscientiously vote for the motion. He declared that his mind was made up on the political principles of what were called the "Charter," with several of which he cordially agreed, and for which he had voted, such as the ballot, and the abolition of the English qualification for members of the House. But he was entirely opposed to universal suffrage, not on any mere doctrine of finality, but on grounds involving the sanctity and security of property; and so regarding it, he drew from the petition itself opinions which, if held by a large majority of the electoral body, would lead to the extinction of the national debt, and a sweeping confiscation of property. No wise government could attempt to do all that the petitioners asked for; there had been for years a systematic attempt to persuade the people that Government would do for them what no Government could do—give manna from the clouds, or multiply the loaves and fishes; whereas, in truth, the Government, instead of being able to provide for the people, must ever be itself dependent on them. If, concluded Mr. Macaulay, the people should ever obtain absolute power—as they would with universal suffrage—they would proceed, through universal spoliation, to try to realise projects of amelioration ending in general ruin. There had been many a great convulsion in the world; but the further one looked towards such a system as that it was proposed to establish, the best thing that he could see as likely to be one of its effects would be, that some strong military despotism would inevitably rise from out the struggle that would take place, in order to give some sort of security to the country. But if they flattered themselves that they would ever see again the institutions of the country restored, they greatly deceived themselves. He was convinced they would not, neither would they desire to see them; whilst neighbouring nations would point with contempt at the wrecks of that great prosperity which had been their glory and their admiration, and would say, "England had institutions—institutions which contained within themselves the seeds and the principles of improvement; and those institutions she threw wantonly away, for no other reason than because asked to do so by persons who told her, at the same time, that they would use such concessions for her ruin."

Mr. ROEBUCK said, he would not form his opinions of the working classes, or their demands, from the trashy wording of the petition. He admitted the folly of the language subscribed by these petitioners: the document had been drawn by a cowardly demagogue; but he did not think this proved the people unfit to have any share in the franchise. The unrepresented people were as enlightened as the present electoral body; and the present body left property still secure. What could be a stronger proof of their peaceable disposition, than that on this very occasion three powerful millions of people had asked quietly, and as a favour, what they firmly believed to be their absolute right? He would own that he did not mean to content himself with a hearing or an inquiry; he wanted the charter itself. He believed the best Government for the people would be the Government of the whole people; and therefore he should support the motion.

After some remarks from Lord F. EGERTON against the motion, Mr. HAWES said that, though he was friendly to progressive and practical reforms, yet in the present state of the country's education he was not prepared to concur in the objects of the Chartists. —Mr. HUME criticised the speech of Mr. Macaulay, and defended the petitioners against the charge of aiming at the robbery of the public creditor. He enlarged upon the existing distress of the manufacturing districts, and expressed his belief that its future recurrence would be prevented by the measures indicated in the charter.—After some observations from Mr. WAKLEY, who commented on the silence of the Ministerial party, and supported at some length the prayer of the petitioners,

Lord J. RUSSELL said he was induced, by the importance of the petition, to express at once his respect for the petitioners and his abhorrence of the doctrines which the petition contained. It had been assumed that the adoption of those doctrines would remove the existing distress; but that he must deny. Let the House reflect upon the consequences of inquiring whether faith should be kept with the public creditor, and the property in land preserved! The very announcement of such a proceeding would create a general alarm, would occasion the departure of capital, and the diminution of the funds for employing labour. It was clear that the author of the "National Petition" contemplated the sweeping away of the National debt; and though, if the case were fairly put to any given assemblage, and they saw the ruin which would be inflicted by such a confiscation, especially on widows and orphans, they would repudiate the notion; yet it was not so clear that under universal suffrage they might not be deluded into approval of the abolition of the debt. Universal suffrage might be fit for the United States, but not for a country like England, where the accumulated property of a long-established aristocracy held out too tempting a prize to a distressed people. He agreed with Mr. Roebuck that the real question was not the hearing, but the charter. Whatever speeches might be made at that bar, he should give his vote against these proposals; and he believed the best course was to explain at once to the petitioners that their suggestions went to shake the property and unsettle the Government of the country, and that the hearing prayed for must be decidedly refused.

Sir R. PEEL would not shrink from a direct opposition to this prayer. He would not grant a delusive hearing, which he knew must end in a refusal. He would not awaken hope, to superadd disappointment. The petition was an impeachment of the whole constitution and social order of these kingdoms. Was the whole business of the country to be suspended while the House inquired whether it would be fitting to spunge out the debt and repeal the union? And this, too, upon a petition which had been described by Mr. Roebuck himself as the work of a cowardly demagogue? It had been said that the people respect the law. Why? Because they believed in its justice—because they knew it to be a law for the poor as well as for the rich. The character of our people had been formed under the very laws and institutions of which this petition contained the impeachment. He concluded with a panegyric on those laws and institutions, and an expression of his confidence in their efficacy for the permanent welfare of the country.

After some other members had made a few remarks, Mr. O'CONNELL said that he should vote for the hearing, not because the repeal of the union was proposed in the petition, with which document, indeed, he did not wish to mix himself, but because he wished to see the suffrage extended. Mr. DUNCOMBE replied, saying that he saw how the petitioners were about to be treated, and that if after that they ever condescended to approach the House again, he would have nothing to do with them. He denied the construction put upon this petition. The House then divided: against the hearing, 287; for it, 49: majority, 238.

The Civil Bill Decrees (Ireland) Bill, the Turnpike Trusts (Ireland) Bill, and the Exchequer-bills Bill, were read a third time and passed. The Victoria Park Bill, and the Knightsbridge and Kensington Openings Bill, passed through committees. The other orders of the day were then disposed of.

Wednesday.—Mr. Hayter, as chairman of the Nottingham Election Committee, reported—"That Sir J. C. Hobhouse and Sir G. G. de Hochepied Larpent were duly elected."

On the motion for the third reading of the Northern Union (Newcastle and Darlington) Junction Railway Bill, Mr. Fielding moved, that clause 333, which proposes to give powers to eight different railway companies therein named, to do things not authorised by their respective acts of incorporation, and for which powers they have not applied to Parliament, be expunged from the bill.—Mr. H. Hinde opposed the motion. A short discussion ensued, and the House divided:—for Mr. Fielding's motion, 0; against it, 105; majority, 105. The Bill was then read a third time and passed.

The Kingston Roads Bill, and the Greenock Harbour Bill, were also read a third time and passed.

Mr. Pakington, as chairman of the Thetford Election Committee, reported that the Earl of Euston was not duly elected, and that Sir J. Flower was duly elected, and ought to have been returned. The Clerk of the Crown was ordered to attend on Thursday to amend the return.

The Speaker acquainted the House that the Downpatrick, Harwich, and Worcester Election petitions were abandoned.

The Ellesmere and Chester Canal Bill was read a third time and passed.

On the motion of Mr. Pakington, John Thurston, who had been committed to Newgate by the Ipswich Election Committee, was ordered to be discharged from custody.

Mr. Bankes moved that the Special Petty Sessions Bill be read a second time.—Sir J. Graham opposed the Bill, and moved that it be read a second time that day six months. The amendment was agreed to without a division.

On the order of the day for the second reading of the Church Patronage (Scotland) Bill, Sir J. Graham stated that in consequence of certain communications, Government had resumed the discussion of this question with the parties principally interested, and, without seeking to indulge himself, or to induce the House to indulge, in too sanguine expectations on this subject, he felt bound to declare that he did not despair of those communications leading to a satisfactory settlement of the question. He, therefore, asked his hon. Friend to consent to a postponement of the present measure.—Mr. Campbell, on that intimation, declared his willingness to postpone the second reading of his bill for six weeks, in order to see what the intentions of Government were.

Mr. F. Maule expressed his surprise at this course. As far as he could gather from Sir J. Graham, the Government measure would be a reproduction of that of the Earl of Aberdeen, which had been repudiated by the people of Scotland. It seemed to him that a compromise had taken place; and as he did not believe that Government had changed their minds, or intended to bring in a more comprehensive measure than that of Lord Aberdeen, he would not agree to any delay, but insisted that the second reading of the bill should forthwith take place.—Mr. Campbell denied with some warmth that he had been overruled, or had withdrawn his bill.—After some observations from Mr. A. B. Cochrane, Mr. P. M. Stewart declared his conviction that the Government measure would turn out to be Lord Aberdeen's bill, and expressed his regret at the course adopted by Mr. Campbell in proposing to postpone his bill.—Mr. Wallace said that the people of Scotland desired to have the power of electing their own parsons; and if therefore he supported the bill, it would be with the intention of carrying it farther than it went.—Mr. E. Ellice made a few remarks, after which Sir R. Peel said that it was quite unusual to take the course of preventing a member from postponing a measure which he had brought in. Mr. F. Maule objected to a delay of six weeks, yet he was three years in office without attempting anything himself. The sole motive which actuated Government, was a desire to settle these unfortunate differences, to which they were encouraged by voluntary communications from men of both parties in Scotland. If there were a hope of settling this question, with the general acquiescence of all moderate men, maintaining the just rights of the Church and the people, he trusted the House would not force on a premature discussion on it.—Mr. Rutherford did not think that the postponement of the discussion would tend to a settlement of the question. If Government meant to legislate on the principles of Lord Aberdeen's bill, they would make a schism in the Church of Scotland which would shake it to its foundation.—Mr. Hume and Capt. Wemyss both expressed themselves in favour of affording time to Government to enable them to bring forward their measure.—The House then divided, when there appeared for the immediate reading of the Bill, 48; for postponing it for six weeks, 131.

After some other business of little importance, the adjourned discussion on the appointment of Mr. Ferrand's committee to inquire into the "payment of wages," or, in other words, the truck system, was resumed; and Mr. C. Buller called the attention of Government to the importance of a proper constitution of the committee.—Sir J. Graham suggested that the Under Secretary of State for the Home Department, Mr. Manners Sutton, and Mr. Cobden should be placed on the Committee.—After a short conversation the debate was again adjourned.

Thursday.—The Bristol and Gloucester Railway Bill, the Bristol Floating Dock Bill, and the Equitable Gas Bill were read a third time and passed.

The Speaker informed the House that the election petition complaining of the return for the county of Kerry had been abandoned.

Lord Ashley gave notice that he should, on May 16, move for leave to bring in a bill to regulate the hours allotted to labour in factories.

Mr. Roebuck gave notice that he should on Friday ask Sir G. G. de Hochepied Larpent, Sir J. C. Hobhouse, Mr. H. Elphinstone, Capt. Plumridge, Viscount Chelsea, and Mr. C. Russell, whether they were cognisant of, or parties to, any arrangement by which any one of them was to accept the stewardship of the Chiltern Hundreds, and thereby vacate his seat in that House, notwithstanding that he should have been declared duly elected by the committee appointed to try the merits of the petition against his return. He should also move, at the same time, for a select committee to inquire whether certain facts connected with the proceedings of election committees did not constitute a breach of the privileges of that House. The Hon. Member added, that he would also put the question of which he had already given notice, to Mr. J. Attwood and Major Beresford.

On the motion of Mr. Redington, the issue of a writ for a new election for the borough of Sudbury was postponed to the 11th June.

Mr. Hutt rose to move for copies of circulars sent by the Secretary of State for the Home Department to the various town-clerks or clerks to the magistrates, between the months of Aug. and Dec. 1841, requiring information as to the state of the magistracy in their respective towns. He supported his motion by referring to the understanding on which the Municipal Corporations Act was finally agreed to, with respect to the recommendations of town councils in the appointment of magistrates, and reviewed some of the recent appointments in different boroughs made since the accession of the present government to office. He said that the system which had been introduced by Sir J. Graham was full of danger to the country; and if it was to be pursued, it might shake the confidence of the people in the administration of justice.

Sir J. Graham had hoped that a distinctive motion would have been made on which he could have asked the House for a decided expression of its opinion. He said that Lord J. Russell, while he was Home Secretary, had not invariably adopted the recommendations of the town councils in the appointment of magistrates, of which several instances were given, stress being laid more especially on the case of Bristol. The proportion of Whigs and Radicals to Conservatives appointed in various boroughs was very great, as evinced by a list in which the names and numbers were given, and from which it appeared that of the 1,026 magistrates nominated by the late Government, the proportions, not including 57 for 13 places to which he had not made any additions, and which, therefore, were not taken into his calculation, were these: Whig-Radicals, 743; Conservatives, 226. From this number he had excluded none, but added many; and the gross number now stood, instead of 1,266, 1,435. The right hon. Baronet concluded by saying, that if ever there was an evil that called for redress, it was this unequal distribution of the magistracy, committed by his predecessors in office for party purposes, and by which justice was prostituted in the boroughs of England; and he, therefore, was prepared to vindicate his conduct, either generally or specifically, with respect to the use which he had made of the prerogative of the Crown, in tempering and moderating this injustice. He had not, whatever might have been the character of his appointments, the merit of recommending any one who had been convicted of treason—he was not responsible for having made John Frost a magistrate.

Mr. F. Maule expressed his astonishment that a Home Secretary should venture in the House of Commons to make the assertion that justice had been prostituted in the boroughs of England. He called in question the accuracy of the list which had been read by Sir James Graham, and endeavoured to show that, in several instances, he had destroyed the previously-existing balance of parties, and had converted the magistracy in these places into a Tory one.—Several Members then spoke, each addressing his observations with reference to the particular place which he represented, and the object of each being, according to his local knowledge or information, to vindicate or criminate the late Government in their magisterial' appointments.—Mr. Wakley regretted that so small a motion should be the basis of so large a question. He thought that the substance of Sir J. Graham's reply to the motion was neither more nor less than this, that he had attempted to cure one evil by another. Political considerations in judicial appointments operated disastrously on the interests of the country; and he hoped Government would avoid them as much as possible in their future appointments.

Sir R. Peel, after pointing out various modes in which the motion might have been framed in order that it might have given greater weight to the debate, said that Government did not vindicate its appointments on the score of political partisanship. With the present constitution of our society and institutions, it was impossible to keep the magistracy free from political imputation; but it was necessary for the satisfaction of the public mind that the magistracy should not be composed almost wholly of one political party. The present Government, in altering a proportion which, in the cases of most of the larger towns, and many of the smaller ones, was glaringly unjust, were merely trying to equalise the number of magistrates from the two parties, instead of giving the preponderance to one; and they, therefore, rested their vindication, not on the plea that because their predecessors had acted from political motives, they also did the same, but on the ground that it was essential to the effectual administration of justice to compose the magistracy of more than one political party.

Lord J. Russell said, that if the Whigs, on coming into office in 1830, had acted upon principles now avowed, there must have been then a sweeping change in the county magistracy, Torified as it was under a long reign of Tory Lord Chancellors and Tory Government. But he was of opinion that such a consideration as political principles should be a very minor one in selecting individuals to fill judicial stations. He did not deny that the town councils generally recommended a great preponderance of magistrates of liberal opinions; but if the majority of people were of these opinions, it was natural that there should be such a preponderance. The noble Lord concluded his speech by some references to the steadiness of his own political course as compared with that of Sir J. Graham.

After some observations from Mr. Williams, Mr. Collins, Lord Worsley, Mr. Strutt, and Capt. Layard, the debate, which lasted from 5 till half-past 12, was closed by a reply from Mr. Hutt, and then the motion was agreed to.

Sir J. Graham postponed the introduction of the New Poor Law Bill until Tuesday.—The Dublin Police Bill was read a third time and passed.—The British Possessions Abroad Bill was read a second time, and ordered to be committed on Monday.—The Punishment of Death (Ireland) Bill was read a third time and passed, as were the Victoria Park Bill, and the Knightsbridge and Kensington Openings Bill.

Sir G. Clerk moved that the Speaker issue his writ for the election of a burgess for the borough of Nottingham, in the place of Sir G. G. de H. Larpent, who had accepted the office of Steward of the Chiltern Hundreds.

Friday.—Mr. Roebuck brought forward his motion, of which he had given notice on the previous night. On putting his question to the individual members whom he charged with submitting to a compromise, Lord Chelsea, Mr. Russell, Sir J. Hobhouse, and Major Beresford, denied his right to make the inquiry; but Capt. Plumridge and Mr. H. Elphinstone admitted that compromises had taken place, though without their cognizance. After an exciting conversation, the debate was adjourned.

The Income-tax Bill was then resumed.—Mr. Hume moved that the income should be calculated on the profits of one year, and not of three; which was rejected by 76 to 27. Mr. Hume then moved that the Act remain in force for one year only; which was negatived by a majority of 122.—Mr. Yorke then moved a clause to exempt attorneys subject to the tax from the payment of certificate duties; but it was rejected by a majority of 165.

CITY.

Money Market, Friday.—The funds still continue firm. Consols closed for money 92½ to ⅝, and for the account 92⅝ to ¾; Exchequer-bills, 36s. to 38s. premium; Bank Stock, 167 to 168; India Stock, 247½ to 248½; Three per Cents. Reduced, 91⅝ to ¾; Three-and-a-half per Cents. Reduced, 99⅝ to ¾; New Three-and-a-half per Cents., 100¾ to ⅞; India Bonds, 21s. premium.

Metropolis and its Vicinity.

New Houses of Parliament.—It is stated that the ceremony of laying the first stone of the Victoria Tower, the intended royal entrance to the new House of Peers, will take place in August, and that if her Majesty should not perform the ceremony, Prince Albert will act for the Queen on the occasion.

The Royal Academy.—The seventy-fourth annual exhibition of the Royal Academy was opened to the public on Monday, and taken as a whole it is considered to be equal to any that has appeared for several years. There are some paintings of the late Sir D. Wilkie, the last productions of his pencil; and several pictures of animals and interiors by Mr. Edwin Landseer. Messrs. Stanfield, Lee, Witherington, and Roberts, exhibit a number of landscape scenes; and Mr. Maclise, among other works, has a large picture of the play-scene in Hamlet, which attracts considerable attention. There are also several of Mr. Etty's compositions, and some good pictures by Sir M. A. Shee, Messrs. Collins, Calcott, Jones, W. Simson, Redgrave, Herbert, Rothwell, and Grant; Mr. Haydon has two historical compositions, and Mr. Martin some of his imaginative paintings. Messrs. Mulready and Allen exhibit but one picture each; that of the latter being a large composition representing the battle of Preston Pans. Mr. Turner has also contributed several works in his peculiar style. In the miniature room there are a number of highly-finished pictures; and in the room appropriated to architectural designs, several plans and elevations, and some views of the Royal Gallery, of the New Houses of Parliament, and of St. Stephen's Hall. The sculpture room contains two unfinished works of the late Sir F. Chantrey; and several figures, groups, and busts, by Messrs. Bailey, Westmacott, Weekes, and Smith.

The National Petition.—Monday being the day appointed for the presentation to the House of Commons of the National Petition in favour of the five points of the Charter, advantage was taken of the opportunity by the Chartists to make a demonstration of their strength. At an early hour large bodies assembled in various quarters of the town; and soon after nine, the streets leading to Lincoln's-inn-fields were thronged with members of various Chartist associations, all proceeding towards the place of rendezvous, where it was computed that upwards of 20,000 persons were assembled. The time appointed for the formation of the procession was one o'clock, about which time the members of the convention arrived. They were preceded by the petition, which was of great size, borne on the shoulders of 16 men, selected from the different trades in the Metropolis. It was carried on a kind of portable stage, covered with ribands, and otherwise decorated; and on the front was placed a placard, from which it appeared that the number of signatures was 3,317,702. The procession then formed and marched in order to the House of Commons. The petition was placed in front, and after it came a large black flag, bearing on one side the inscription, "Murder demands Justice, 19th August, 1819;" and on the other, a representation of the Manchester massacre. Another flag was inscribed, "We require justice before charity—the People's Charter, and no surrender!" and on the other side of it, "Every man is born free, and God has given man equal rights and liberties; and may it please God to give man knowledge to assert those rights, and let no tyrannical faction withhold them from the people." The procession arrived at the House of Commons at a quarter past three, where upwards of 50,000 persons were congregated. The delegates and those who carried the petition were then admitted to the House, where the petition was presented in due form by Mr. Duncombe, member for Finsbury. A large body of the police were in attendance, and the military had orders to be under arms during the day. There was, however, no occasion for their interference, and the whole affair passed off without any accident or disturbance of the peace.

The Tower.—It is said to be in contemplation, to effect great alterations and improvements in this fortress, to build new barracks, and to fill up the moat which now surrounds the walls. Surveyors have been employed for some time past preparing the necessary plans.

Public Meetings.—The annual meeting of the Wesleyan Missionary Society was held on Monday. From the report for the past year, it appeared that the receipts amounted to 101,688*l.* 2*s.* 4*d.*, and the expenditure to 98,754*l.* 7*s.* 9*d.*, leaving a surplus of 2,933*l.* 14*s.* 7*d.* Of the total amount of the receipts, the following are some of the principal items:—Great Britain, 70,788*l.* 3*s.* 3*d.*; Ireland, 5,061*l.* 13*s.* 4*d.*; foreign auxiliaries, 12,322*l.* 7*s.* 10*d.*; legacies, 1,156*l.*; Parliamentary grants, 5,400*l.*; and Juvenile Christmas donations, which appear to be a new source of income, 4,721*l.* 7*s.* 4*d.* The net increase of the year, as compared with the preceding, is 11,505*l.* 13*s.* 8*d.* The present number of principal or central mission stations, called circuits, occupied by the society in the several parts of the world, is 261; the number of missionaries employed, exclusive of catechists, 368; the number of full and accredited church members, exclusively of those under the care of the society's missionaries in Ireland, 87,258; and the number of scholars in the mission schools is nearly 60,000. The Report was adopted.—The annual meeting of the Church Missionary Society was held on Tuesday. The Earl of Chichester took the chair, supported by the Bishops of Ripon, Chester, and Norwich, and a large body of the clergy. The report detailed at great length the operations of the society in various parts of the world during the past year. The labours of the missionaries appear to have been successful in India and in Africa, as well as in New Zealand, and the other colonies of Great Britain. The total amount of the receipts for the year was 90,821*l.*, and of the expenditure 110,808*l.*, leaving a deficiency of 19,987*l.* The report, the reading of which occupied nearly two hours, was adopted unanimously.—The anniversary meeting of the Zoological Society has been held, at which the report of the auditors announced that the income of the last year was 11,611*l.* 15*s.* 11*d.*, which, with the proceeds of the sale of 1,500*l.* Exchequer bills, gave a total of 13,298*l.* 10*s.* 8*d.* Among the items of the receipts were 155*l.* from admission fees, 120*l.* from compositions, and 4,987*l.* 7*s.* from annual subscriptions, as well as a sum of 4,659*l.* 11*s.* derived from admission to the gardens. The total expenditure in 1841 was 10,931*l.* 7*s.* 5*d.* The cost of animals was 762*l.* 15*s.*, of provisions 2,284*l.* 19*s.* 3*d.*, menagerie expenses 666*l.* 16*s.* 11*d.*, garden expenses 546*l.* 14*s.*, buildings 240*l.* 14*s.*, and works 1,099*l.* 13*s.* 4*d.* The income for the past year, compared with that of 1840, exhibited a decrease of 420*l.* 5*s.* 6*d.*, whilst the receipts from the annual subscriptions, past and present inclusive, were less than those of the preceding year by 530*l.* 18*s.*

The report of the council announced that the present number of members was 2,727, whilst the visitors to the gardens in the past year had been 132,316, of which number 38,177 were privileged and 93,139 visitors.—On Tuesday a general meeting of the shareholders of the Alten Mining Association was held. From the report, it appeared that the meeting was convened in consequence of the unfavourable result of the transactions of the company at their mines at Alten, in Norway, the directors desiring as soon as possible to afford every information. The expenditure during the past year was 19,258*l*. 8s. 1d., and 156 tons of copper had been disposed of, amounting to 13,765*l*. 6s. 8d., thus leaving a loss of 5,493*l*. 1s. 5d., in addition to minor losses. The call made in Oct. last had been paid on 1,895 shares, leaving only 105 liable to forfeiture. In conclusion, the directors advised that the association should continue to prosecute the mines for another year, at the lowest possible expense. Mr. Potts said they had virtually lost 7,000*l*., and thought it best to dissolve the company. The chairman said the company had entered into engagements for the current year. Mr. Gibson hoped, if the expenses were reduced from 19,000*l*. to 14,000*l*., and the returns were only 200 tons for the current year, which was a great deal less than was anticipated, a profit would be realised. The expense of labour, and the cost of smelting abroad, had been the cause of the increased expenditure. Mr. Nellen stated that, from the year 1833, the proceeds of one of the mines had increased from 4,000*l*. to 22,000*l*. in 1840, when in the last year they had diminished to 13,765*l*.; but as the mine had only been worked 20 fathoms deep, he thought it might still turn out most profitable. It appeared from the conversation, that 130,000*l*. had been realised from the mines in less than ten years; 10,000*l*. paid in dividends, and 67,000*l*. had been raised for mining purposes, at the rate of 13*l*. 10s. per share.—On Tuesday the annual meeting of the proprietors of the Southwark-bridge Company was held. The Secretary read a brief report, from which it appeared that an additional 2s. 6d. per share was accounted to the proprietor of the new stock, and that the steam-boat pier at the bridge held out a fair prospect of improvement. The total amount of the bridge traffic was nearly 4,000*l*. for the year, and the net profit of the pier exceeded 300*l*.—On Monday, a meeting was held in the district church of All Souls, Langham-place, for the purpose of taking measures for the erection of a new church or chapel of ease in that populous portion of the parish of St. Marylebone. The Dean of Chichester, Rector of All Souls, took the chair. He stated that there were in the parish 140,000 persons, and that there was only church accommodation for 22,000, the district of All Souls being worse provided for than any of the others. Towards the erection of the new church, the Metropolis Churches Fund has made a grant of 2,000*l*., and the Dean of Chichester 300*l*. Lords Beresford and Radstock, and Mr. Hope, had subscribed 100*l*. each, and there were many other contributions of smaller amounts from the clergy and inhabitants of the district. The church is to be situate in Charles-street, Middlesex Hospital, and an ecclesiastical district will be assigned to it. Lords Teignmouth and Radstock, and several clergymen and gentlemen, spoke in support of the resolutions, which were adopted unanimously.—The anniversary meeting of the Royal Institution was held on Monday, B. Bond Cabbell, Esq., in the chair. The report of the visitors announced that the expenditure for the past year was 2,398*l*. 3*s*. 11*d*., and 200*l*. advanced to the patrons of the Library, whilst the receipts were 2,391*l*. 9*s*. 10*d*.; and as the former included a large sum for repairs, the society might be considered in a flourishing condition. They congratulated the members on the restoration of the health of Mr. Faraday, which had enabled him recently to give a course of juvenile lectures.

University College.—On Saturday, the annual meeting of the Council was held for the purpose of distributing prizes to the students in various departments of medical science. Lord Campbell presided, and presented the several medals to the successful candidates, among whom the first certificate and gold medal in botany were presented to Mr. W. J. Preston, of London; and the second certificate and silver medal to Mr. J. D. Heaton, of Leeds, and Mr. J. E. Stocks, of Hull, who were declared to be equal. After the distribution, the chairman addressed the meeting, congratulating the friends of the institution on the unequivocal success which had crowned their efforts. It was announced in the course of the proceedings that a donation had been made to the College by Lord Brougham, of above one hundred of the works printed at the Government press at Grand Cairo, and which had been presented to his Lordship by Mehemet Ali.

Wood-Pavement.—The introduction of wood-pavement in the Metropolis appears to be gradually gaining ground. In addition to the various places which have already been thus paved, notices were posted at Guildhall on Monday, stating that the City authorities were ready to receive tenders for wood-pavement to be laid down in Cornhill, Gracechurch-street, Newgate-street, and part of the Old Bailey.

Mortality in the Metropolis.—The following is the number of deaths that have occurred in the Metropolis from all causes, registered in the week ending Saturday, the 23rd April:—males, 421; females, 388; total, 809. Weekly average 1838-9-40-1, males, 467; females, 445; total, 912.

Police.—On Thursday, the neighbourhood of Hornsey, Highbury, and Islington, were alarmed by the intelligence that one policeman had been killed, and a man residing at Hornsey and another policeman had both been seriously wounded, by a highway robber whom they were pursuing for the purpose of taking into custody. It appears that a number of robberies have lately been committed on persons passing through the fields near Hornsey-wood House by a foot-pad, said to have been heavily armed, and a description of whose person was a few days since forwarded to the police station. In consequence of this information, additional men were placed near the spot complained of. On Thursday afternoon, one of the policemen observed a man, answering the description of the robber, following a gentleman near Hornsey-wood House. He accordingly pursued him, and on approaching within a few yards the man turned round and fired a pistol at him, which broke his arm. He, however, continued the pursuit, in which he was joined by a man named Mott, who, on coming up with the prisoner, was also fired at and severely wounded in the shoulder. A person passing at the time in a chaise then pursued the robber, who during his flight was observed to reload his pistols, but near Highbury College he was overtaken by a policeman, who made an attempt to seize him, and in doing so was fired at and killed on the spot. The murderer was then secured and conveyed to the police station; and on his person were found a brace of pistols, a large knife, and a quantity of powder and bullets. His name is Thomas Cooper; he was brought up for examination before the magistrates, when it was ascertained that he had taken poison, and that his recovery is doubtful. The wounded men are said to be doing well, and fatal consequences are not apprehended.

Woolwich.—It is stated that extensive improvements are about to be effected in this dockyard by enlarging the inner basin upon a plan of Mr. Walker, the expense of which is estimated to be about 38,000*l*.; and that it is intended to take in the ground opposite the slip whence the Trafalgar was launched; the whole of the work to be under the immediate superintendence of Capt. Denison, R.E. It is announced that the Lords Commissioners of the Admiralty, in consequence of the obstructions which have hitherto taken place when practice and experiments have been made in the marshes, have ordered that boats shall be regularly stationed in the River to ensure that no vessel anchor within the range. It is understood that a number of important experiments will be made this season of various descriptions, besides the practice with shells, which will be resumed in a few weeks. The large erection built at the butt last year has been repaired, and painted to represent the side of a two-deck frigate, showing the space occupied by five large guns. Experiments will shortly be made at this erection to test the capabilities of an invention for resisting the effect of shot fired at steam-vessels when at sea. An iron tank or case has been put up, containing upwards of 30 tons of coals in it, against which the trial will be made when all the arrangements are completed.

Strawberry Hill.—The views both public and private of this place having concluded, the sale of the things contained in it commenced last week. The crowds who have visited the building and examined the curiosities it contains have been very great; the place, for many days, resembled a fair, and the adjacent villages of Teddington and Twickenham were crowded with the horses and servants of the visitors. More than fifty thousand persons altogether are said to have been attracted to the spot. A temporary building was erected on the lawn where the sale has taken place, and arrangements were made for accommodating several hundreds of visitors. On the first day of the sale, which commenced with the books, there were about 200 persons present; but the attendance on the subsequent days of the sale has been more numerous. Last week was occupied entirely with the sale of books, which fetched a considerable sum; and several choice works realised high prices. The collections of old and rare coins were sold during the early part of this week; and some of the pictures, drawings, and miniatures were disposed of on Thursday and Friday. The sale is expected to continue another fortnight. Several thousand pounds have already been realised, and the entire effects have been variously estimated as likely to produce from 30,000*l*. to 50,000*l*.

Provincial News.

Blackburn.—Some disturbances, attended with loss of life, have occurred in this town, occasioned by the news of Mr. Turner's defeat in his petition against the return of Mr. Hornby, the sitting member for the borough. The arrival of a coach from Manchester, bearing the colours of the successful party, was the signal for the commencement of outrages on the part of the excited mob. The coach was overturned, the favours torn from the horses, and the pavement torn up by the crowd to serve for missiles. The Bull's Head Inn, the committee-room of Mr. Hornby, was the object of attack, the whole of the windows in it being demolished, and other damage done to a serious amount. One of the magistrates repaired to the spot, the Riot Act was read, and the military called out. The mob upon this quickly dispersed, but not before one individual had lost his life, being thrown down by the crowd and trampled to death. Order, however, was soon again restored, and the peace of the town has not since been disturbed.

Dudley.—No further disturbances have taken place in this town and neighbourhood since our last, but considerable excitement still prevails among the workmen. It is stated that the "strike" is the most general that has ever been known in this part of the country; and that on Monday a party from West Bromwich proceeded to Birmingham in a body, and compelled a number of men to leave their work, in the neighbourhood of the Bristol road, where a few members of the trade pursue their avocations. A number of the colliers have also struck for wages, but the military force is so great that they have as yet been deterred from committing any outrages.

Leicester.—This town has been the scene of some serious disturbances, arising out of the management of the workhouse. It appears that the able-bodied men who receive relief were required to attend; and, as a test of their destitution, were employed in turning the wheel at the Union workhouse. This plan seems to have been disliked by the paupers; and they have, in consequence, frequently injured and broken the machinery. A few days since the mill was again broken, and several individuals being proved to have committed the offence, they were taken into custody and conveyed to the gaol, upon which a great concourse of the lower classes assembled, threatening language was used, and stones were thrown. During the whole of the day the streets were thronged by people, who threw stones at several individuals, and many shop-windows were broken; the shopkeepers at length closed their shops, and at an early hour all business was suspended. The mob next went to the workhouse, and broke a number of windows there; upon which, the magistrates reinforced the constabulary, with a number of special constables; and an express was sent to Loughborough for the troop of dragoons quartered there, which arrived in the course of the night. Eleven of the leading rioters were arrested; and these prompt measures on the part of the authorities put a stop to the disturbances; although the town continued for some time in an excited state, and when the rioters were brought before the magistrates, a rescue was feared. Two prisoners were discharged, and the remaining nine have been committed for trial.

Oxford.—Lady Chantrey has signified her wish to present to the University the originals of the late Sir F. Chantrey's monumental and other large figures, as well as the entire series of his busts, and his copies from antique statues and busts, the greater part of which were taken at Rome from moulds made for the Emperor Napoleon, on condition that a permanent place be assigned to them in the Western Sculpture Gallery of the new University Galleries now in course of erection, as laid down in Mr. Cockerell's plan. A convocation has accordingly been held, at which it was unanimously resolved to accept Lady Chantrey's offer; it being understood, that if it should ever be necessary to remove the larger casts from the place selected for their reception, a room of equal dimensions connected with the sculpture gallery shall be provided for them, in which the whole collection, under the name of the Chantrey Collection, shall be always kept together. Lady Chantrey has signified her intention to defray the cost of removing the collection to the University.—The sculptured figures of Cranmer, Ridley, and Latimer, for the Martyrs' Memorial, have arrived in this city, and operations have been commenced for fixing them in the niches which they are destined to occupy. The figures, which are by Mr. Weekes, are seven feet high without the plinth, and are well executed.

Merthyr Tydvil.—A murder has been committed in this town by a man named Richard Jamar, the person murdered being his own mother. Immediately after the commission of the act, the motives for which do not appear, the murderer escaped, and, though closely pursued by the police, succeeded in making his escape into one of the neighbouring woods. Here he contrived to conceal himself for several days, but was ultimately captured by his father-in-law and several labourers, who found him in a wood near Rhyh-y-Carr. It is stated, that on being taken, he acknowledged that it was his intention to have murdered his father-in-law, and perhaps some more of the family, that night. He was conveyed, amid a large concourse of persons, to the gaol, and has since undergone an examination before the magistrates, who have committed him to take his trial.

Portsmouth.—It is announced that the operations against the wreck of the Royal George, which have been some time suspended—the results of which, as far as they have proceeded, have been given from time to time in former Numbers of this Paper—will re-commence forthwith; three lighters, with suitable apparatus, have been provided for this service; and it is intended, if possible, to clear the whole of the remaining portion of the wreck during the forthcoming season. The process is expected to be slow, as the remains are deeply embedded in the mud.

Stafford.—It is stated that a large number of forges in this neighbourhood have ceased work, whereby a great number of hands have been thrown suddenly out of employment. The want of orders, even at unremunerating prices, is said to be the reason that has compelled many of the masters to stop their mills and discharge their men, and it appears to be uncertain when they will recommence. Several other extensive works are daily expected to cease operations; and it is even said that all the forge-owners contemplate the necessity of stopping.

Windsor.—Extensive alterations have lately been commenced in the mansion and grounds of Frogmore-lodge, it having been finally arranged that the mansion is to be appropriated to the use of the Duchess of Kent. The workmen have received orders to complete the whole of the works in progress within two months. The different buildings in the stable-yard have been removed; and the large carpenter's workshop and storehouse is to be converted into a stable of commodious size. The numerous temples, grottoes, picturesque huts, and hermitage, with the hermit's kitchen, which are erected in various parts of the grounds, are to be repaired and tastefully embellished, and the several walks and drives improved. The shrubberies, which since the decease of the late Princess Augusta appear to have been neglected, will be carefully attended to, under the inspection of Mr. Ingram, who has the superintendence of this portion of the contemplated improvements. Mr. M'Guire, who has been upwards of 30 years in the Royal household, and who was formerly gardener at Kew, and at Cumberland and Cranborne

Lodges, has received the appointment under Mr. Ingram, and resides upon the premises. It is also stated that the rooms in the Lodge, not occupied by the Duchess of Kent, will be converted into a nursery for the Prince of Wales and the Princess Royal.

Railways.—The following are the receipts of the principal railways for the past week: Blackwall, 782*l.*; Edinburgh and Glasgow, 2,072*l.*; York and North Midland, 1,562*l.*; Midland Counties, 2,524*l.*; North Midland, 3,987*l.*; Great North of England, 1,302*l.*; South Western, 3,987*l.*; Birmingham and Derby, 1,040*l.*; Great Western, 12,950*l.*; Northern and Eastern, 1,230*l.*; Manchester and Leeds, 4,427*l.*; Greenwich, 820*l.*; Croydon, 443*l.*; Birmingham, 16,313*l.*; Eastern Counties, 890*l.*; and Manchester and Birmingham, 352*l.*—Goods are now carried on the London and Blackwall railway from the West India Dock station, but not to any great extent, the arrangements not being yet finally completed.

IRELAND.

Dublin.—It has been announced that the Bank of Ireland has reduced the rate of discount on English and Scotch bills from five to four per cent. The rate on Irish bills, however, remains unaltered.—The Privy Council have held a meeting, at which Sir E. Blakeney has been sworn in one of the Lords Justices of Ireland.—A meeting of corn-dealers was held on Tuesday at the Corn Exchange, in consequence of the recent decision of the Recorder relative to the legal contents of "the barrel," noticed in a former Number, when it was unanimously resolved, "That the corn-trade of Dublin should purchase for the future, instead of by the barrel, as follows:—barley and bere per the 226 lbs., wheat per 282 lbs., malt per 170lbs., at standing beam."

Cork.—The corporation of this city have resolved on discontinuing an official residence for the mayor, and on reducing that officer's salary to 500*l.* a-year. It is stated that a saving of nearly 1,500*l.* a-year will be thus obtained. —It is said that the merchants in this city have received intelligence of some important alterations about to be made respecting the mails that convey their letters to the south of England. It appears that the correspondence from all parts of the south of Ireland to the southern parts of England is sent through London, because the mail is sent from Bristol to Portsmouth a short time before the Welsh mail with the Irish letters arrives in the former town; the consequence of which is that such correspondence is twelve hours later reaching the south of England than was formerly the case. It is expected that the contemplated alterations will remedy this evil.

Downpatrick.—In compliance with a notification received from his Excellency the Lord-Lieutenant, a meeting of the magistrates of the county has been held in this town, to take into consideration the propriety of making a permanent addition of 15 men to the constabulary force of the county. The meeting was held with closed doors, the reporters of the public press not being admitted. It is, however, understood that the substance of the resolutions adopted were, that two additional police-stations be formed in those districts where it is considered they are most needed, and that men to occupy them be selected from such other parts of the county as it may be adjudged can best spare them; and further, that the 15 men sent down from the reserve force be retained to do duty in those districts until the two additional stations are formed.

King's County.—An inquest has been held on Mr. Roberts, whose murder was noticed in a previous Number, when a verdict was returned of "Wilful murder against some person or persons unknown." It appeared that two men were seen to run from the plantation on the shot being fired; but there was no attempt made to follow them. The only cause assigned for the murder is, that Mr. Roberts took a farm about a year ago which a man named Corcoran held, and from which he had been ejected. An additional police force has been ordered to Moneygall, the scene of the murder.—It is reported that three men have been arrested in this county, charged with being concerned in the murder of Lord Norbury. It is stated that a letter was received from New York by an illiterate peasant in this county, who took it to a neighbour to read for him; that it mentioned various circumstances connected with the murder and the persons engaged in it, and expressed the hope of the writer that the affair had blown over. The police having obtained information of the contents of the letter, which they secured, have since arrested three men named in it. It is also stated that Lord Charleville has proceeded to Dublin on the subject of these arrests.

Limerick.—It is stated that the number of emigrants to Canada and the United States, from this port alone, during the present season, already amounts to 3,032. Of these, some were provided with free passages by Col. Wyndham, from his estates in Clare, and some by the Marquis of Clanricarde, from his estates in Galway.

Tipperary.—Two men have been arrested at Williamstown, in this county, charged with the murder of Mr. Butler Bryan, in the county of Wexford, near his own house, in the course of last summer, the particulars of which were given in this Paper at the time. One of them, charged with conspiring to murder, is a farmer holding 70 acres of land, who had a dispute with deceased. The other is a man named Dwyer, who is stated to have been "hired for thirty shillings to go and shoot Mr. Bryan." This statement, it appears, rests upon the testimony of an approver, who alleges that he accompanied Dwyer on the occasion.

Waterford.—A public meeting has been held in this city for the purpose of devising the best means to promote and encourage native manufactures. Several resolutions were adopted, pledging the meeting "not only to give a preference to such articles as were at present manufactured in Ireland, but to use every exertion to establish new manufactures throughout the country."

Wicklow.—A local paper informs us that a few days since a piece of gold, weighing five ounces and a half, was picked up by a labourer employed in the Wicklow gold mines. It is now in the possession of Capt. Roberts, of the Cunnery copper mines, and is said to be the heaviest piece that has been found for more than thirty years, and probably the largest specimen of unwrought gold at present in Ireland.

SCOTLAND.

Greenock.—A meeting of the Renfrewshire Bank creditors was held in this town on Monday, when a statement of the liabilities and assets of the company was produced by the interim trustee on the estate. The liabilities were stated to be 225,620*l.* 15s. 5d.; the assets, 115,300*l.*; deficiency, 110,320*l.* 15s. 5d.

Miscellaneous.

The Niger Expedition.—The "Liverpool Mail" states that it has been favoured with the sight of a letter from one of the survivors of the Niger Expedition, dated from on board H. M.'s steam-vessel the Wilberforce, Island of Ascension, Feb. 14, in which the writer says, "that very few are left to recount what they have seen and felt during the expedition. All the marines had died, with the exception of Serj. Hodges; Privates G. Velley, D. Bloomfield, H. Gibson, and W. Innes: these had been attacked with African fever and recovered, but the disease had made a permanent mark on some of their constitutions. It was expected that the Wilberforce would again go up the river very soon, but it was doubtful whether any one would live to state the result. She would remain at the Island of Ascension for despatches from the Government by a 16-gun brig, which was daily looked for. The actual number of deaths is stated to be about 70, all of them having happened in from four to six weeks. Mr. Waddington, of Liverpool, had been appointed boatswain of the Wilberforce, and was very highly spoken of. Those who are spared calculate on returning to Liverpool about August next." "The Liverpool Courier" states that they have been favoured with the following extract of a letter received by a gentleman in that town, dated, Ascension, March 9:—"The Albert left Fernando Po on the 18th of December. We called at Prince's, St. Thomas's, and Anabona, and arrived here on the 28th of January. Dr. Vogel, the botanist, died at Fernando Po on the 17th of December. I am going in the Wilberforce to Fernando Po to join the Soudan, and go up the river again. We sail to-morrow. I believe the Albert is coming home." It will be seen under our Portuguese news that a steamer has been despatched to Sierra Leone by Government, to order the vessels attached to the expedition home.

The Fine Arts Commission.—The Commissioners appointed by the Queen for the purpose of inquiring, first, whether, on the rebuilding of Her Majesty's Palace at Westminster, wherein her Parliament is wont to assemble, advantage might not be taken of the opportunity thereby afforded of promoting and encouraging the fine arts in the United Kingdom—and, secondly, in what manner an object of so much importance might be most effectually promoted—have resolved that it would be expedient for furthering of the objects of their inquiry, that means should in the first place be taken to ascertain whether fresco-painting might be applied with advantage to the decoration of the Houses of Parliament. 2. Although some years must elapse before the walls of the new buildings can be in a fit state for paintings of any kind, yet, as fresco-painting has not hitherto been much practised in this country, and as therefore candidates for employment in that mode of painting, whatever their reputation or general skill may be, will probably find it necessary to make preparatory essays, Her Majesty's Commissioners think it expedient that the plan which they have resolved to adopt in order to decide on the qualifications of such candidates should be announced forthwith. With this view Her Majesty's Commissioners hereby give notice— 3. That three premiums of 300*l.* each, three premiums of 200*l.* each, and five premiums of 100*l.* each, will be given to the artist who shall furnish cartoons which shall respectively be deemed worthy of one or other of the said premiums by judges to be appointed to decide on the relative merit of the works. 4. The drawings are to be executed in chalk or in charcoal, or in some similar material, but without colours. 5. The size of the drawings is to be not less than 10 nor more than 15 feet in their longest dimension; the figures are to be not less than the size of life. 6. Each artist is at liberty to select his subject from British history, or from the works of Spenser, Shakspeare, or Milton. 7. The finished drawings are to be sent in the course of the first week in May 1843, for exhibition, to a place hereafter to be appointed. 8. Each candidate is required to put a motto or mark on the back of his drawing, and to send, together with his drawing, a sealed letter containing his name and address, and having on the outside of its cover a motto or mark similar to that at the back of the drawing. The letters belonging to the drawings to which no premium shall have been awarded will be returned unopened. 9. If a drawing for which a premium shall have been awarded shall have been executed abroad, or shall have been begun before the publication of this notice, the judges appointed to decide on the relative merit of the works may, if they shall think fit, require the artist to execute in this country, and under such conditions as they may think necessary, an additional drawing as a specimen of his ability, and in such case the premium awarded to such artist will not be paid unless his second drawing shall be approved by the judges. 10. The drawings will be returned to the respective artists. 11. The competition will be confined to British artists. 12. The judges, hereafter to be appointed to decide on the relative merit of the works, will consist partly of artists. 13. The competition hereby invited is open to all artists, although it has more immediate reference to fresco-painting. 14. The claims of candidates for employment in other methods of painting, in other departments of the art besides historical painting, and in decoration generally, will be duly considered. 15. Her Majesty's Commissioners will announce at a future period the plan which they may adopt in order to decide on the merits of candidates for employment as oil-painters and as sculptors. 16. The range of choice in regard to subjects, which has been left (in paragraph 6) to the discretion of the artists, has reference to the present competition only, and is not to be understood as implying the adoption of any particular scheme for the decoration of the Houses of Parliament. 17. The judges to be appointed to decide on the relative merit of the drawings will, it is presumed, be disposed to mark their approbation of works which, with a just conception of the subject, exhibit an attention to those qualities which are more especially the objects of study in a cartoon; namely, precision of drawing, founded on a knowledge of the structure of the human figure, a treatment of drapery uniting the imitation of nature with a reference to form, action, and composition, and a style of composition less dependent on chiaro-scuro than on effective arrangement.

Exchequer Bills.—It appears from a return in detail of loans advanced by the commissioners for the issue of Exchequer Bills for public works and fisheries, and employment of the poor, that the total amount of loans advanced from June 17, 1817 (the date of the commission), to the 31st December, 1841, for various public works, &c., was 6,332,150*l.* Of this account the sum of 234,000*l.* has been advanced for carrying on the Thames Tunnel, and 440,600*l.* advanced to railways.

Law.

VICE-CHANCELLOR'S COURT.—*Cooke* v. *Fryer.*—The circumstances of this case were as follows:—Mr. Fryer married the daughter of Sir Gregory Page Turner, a lunatic, the daughter being under age, but not a ward of Court. Upon the proposal of marriage being made, Lady Turner, the mother of Miss Turner, applied to the Court for its consent to a marriage by license, and upon Mr. Fryer agreeing to settle 20,000*l.*, the Court gave its consent. Mr. Fryer subsequently wishing to settle property, which was alleged to be worth considerably more than 20,000*l.*, instead of money, and this alteration being objected to by the counsel who had been consulted respecting the settlement, and some delay and disputes having consequently arisen, the parties were married by banns, without reference to the application which had been made to the Court, but having previously executed other articles for a settlement. The proposal made to the Court was that 20,000*l.* should be settled in such manner as Lady Turner should direct, and that there should be four trustees, two to be named by Lady Turner, and two by Mr. Fryer; upon which Lady Turner wrote to the plaintiff, requesting him to be one of such trustees, which trust he by letter accepted. Lady Turner was a party to the articles for a settlement, which were actually executed. The plaintiff was, unknown to himself, named as a trustee in the lastly-mentioned articles. The plaintiff filed a bill against Mr. and Mrs. Fryer, the latter of whom had subsequently come of age, and the other trustees of the settlement, for specific performance of the settlement of 20,000*l.*, according to the proposal entered into with the Court. The principal points were—1st, whether that proposal was binding, the marriage having been solemnized by banns, without regard to the consent given by the Court, which consent was only necessary for a marriage by license; and 2dly, if so, whether Mr. Cooke had a sufficient or any interest to enable him to maintain such a suit. The latter point was reserved, but upon the first the Court expressed a decided opinion that the proposal for a settlement was binding, notwithstanding the marriage was solemnized by banns; but that if upon inquiry it should be found that the settlement actually agreed upon was more beneficial for all parties than that originally proposed, it would be adopted by the Court, but the Court could not direct any reference on that point, unless it should be of opinion that the plaintiff had sufficient interest to maintain the suit.

CONSISTORY COURT.—*The Braintree Case.*—Dr. Lushington gave judgment in this important Church-rate case, which has excited considerable interest. The pleadings extended to great length, but the main question was whether, after the parishioners had refused a rate for the necessary repairs of the church, and a monition had issued calling on them to do so from the Court, the minority could bind the majority, as the amendment, refusing the rate, had been carried. Dr. Lushington gave an elaborate judgment, in which he entered into the whole history of Church-rates; and after an analysis of the cases bearing upon the point, the Court decided that the rate so made was invalid in law, and therefore rejected the libel, thus putting an end to the suit against Mr. Gosling, the parishioner.

COURT OF QUEEN'S BENCH.—*The Queen* v. *H. L. Alleyne.*—This was an indictment against the defendant for sending a hostile message to Mr. H. Power, a solicitor of Atherstone, in the county of Warwick. The case was brought to trial at the last assizes, and the defendant having been found guilty upon the indictment, he was now brought up for the judgment of the Court. The reports of the case have appeared at great length; but the following will be found the most important features in the transaction. It appears that, in the autumn of 1838, the defendant, with a Miss Alleyne, represented to be his sister, were staying in a boarding-house at Ramsgate, where they lived in great style, and where they became acquainted with the Rev. Mr. Roberts, of Witherly, in Warwickshire, by whom they were invited to visit Witherly, which invitation they accepted. During their stay there they were introduced to several of the neighbouring gentry, amongst whom were a Mr. Dempster Heming, a banker, 60 years old, and a Mr. J. Sandford, the nephew of Mr. Heming. Mr. Sandford paid attentions to Miss Alleyne, who was represented as being the niece of Sir Reynold Alleyne, formerly Governor of Barbadoes. Mr. Heming consequently authorised his nephew to invite Miss Alleyne and her brother to his seat, Caldecote Hall, and proposals were soon after made by the nephew for Miss Alleyne's hand. The engagement, however, was ultimately broken off; and Mr. Heming himself falling in love with Miss Alleyne, married her. The intended marriage of Mr. Heming having excited very unpleasant feelings in his own family, inquiries were set on foot for the purpose of testing the veracity of the statements made by Mr. and Miss Alleyne about themselves; and, as opportunities were afforded for consulting some of the near relatives of Sir R. Alleyne, as well as communicating with Sir Reynold himself, it was ascertained that he never had had a brother, except one, who died at Eton at the age of 16. A general impression had moreover grown up in the neighbourhood that Mr. Alleyne and Miss Alleyne were not really brother and sister, but man and wife. The defendant having assumed or ascertained that the prosecutor was one of the parties who had uttered this "foul and malignant slander," called upon him for satisfaction; and upon Mr. Power's refusal to give a hostile meeting, posted him as a slanderer, a liar, and a coward. A number of affidavits were read on the part of the prosecution, the object of which was to show that the defendant, and the now Mrs. D. Heming, had given false accounts of themselves upon several occasions, and were not the children of the persons whom they represented as their father and mother; that the defendant Alleyne was really the son of a shipwright of Lyme Regis of the name of Chard; that the female at different times had assumed the names of Chard, Elworthy, and Alleyne; and that, whatever might be the truth of the reports which were in circulation about them, those reports were generally believed in Warwickshire, and had not originated with Mr. Power, but with some other persons; and that Mr. Power had only brought the matter forward when a proposal was made to appoint Alleyne a director of a bank at Hinckley, in the character and prosperity of which Mr. Power was deeply interested, professionally and personally. Such was the general nature of the affidavits. Lord Denman, in giving judgment, said that it was the opinion of the Court that the statements which were already in evidence were sufficient to show the commission of conspiracy and fraud by the defendant and his sister. His Lordship also observed, that the statements in question would have some effect, when the Court came to consider the amount of the penalty to be imposed upon the defendant. It was, however, only proper that he should have the opportunity of answering such points of that statement as he might be able and might think it necessary to answer. Such affidavits, therefore, as were intended to be relied on, and remained yet unread, upon the part of the prosecution, would be handed over to the defendant, who might hereafter be brought up for judgment again, if the prosecutor should think it worth his while to do so. His Lordship stated, in the course of his observations, that Mr. Power appeared to have acted with perfect propriety in his intercourse with the defendant upon the subject of the indictment; and that the affidavits, although they disclosed indisputably that Mr. Alleyne and the lady had been guilty of misrepresentation and fraud, also proved that the parties were brother and sister, and not man and wife.—No addresses were made upon the present occasion by any of the counsel on either side, and the case was directed to stand over generally until next term.

TATTERSALL'S, THURSDAY.—A few of the Chester visitors left at Wednesday's races, and were in attendance at the room; the muster, nevertheless, was thin, and the inclination to do business so slight that not a dozen bets were booked from first to last. The following is a list of the quotations, premising that Canadian is now the property of Mr. Greville (the price said to be 2,000 guineas with contingencies), and Chatham of Lord George Bentinck.

DERBY.

7 to	2 agst	Attila (taken to 300*l.* or or 400*l.*)	40 to	1 agst	Lasso (taken)
6	1	Frederica colt (taken freely, 475 to 100 once)	45	1	Fireaway (taken)
15	1	Auckland (taken to 300*l.* and afterwards offered)	50	1	Barrier (taken)
25	1	Tiptoe (taken)	3000	30	Combermere (taken)
28	1	Ballinkeele (taken)	24	1	Porth's lot (taken)
30	1	Chatham (taken)	8	1	Canadian and Robert de Gorham (tak. to 100*l.*)
30	1	Lord of Holderness (ta. and afterwards off.)			

Large sums were laid even between Tiptoe and Ballinkeele, and between Tiptoe and Chatham.

MARK LANE, FRIDAY, MAY 6.—Business on our market has been quite at a stand-still to-day, even at lower prices no progress could be made with sales of free foreign Wheat; there is still some inquiry for bonded.—Barley is 1*s.* cheaper, and Peas and Beans are a dull sale at declining prices.—Oats are in limited demand at 1*s.* reduction.

GAZETTE OF THE WEEK.

INSOLVENTS.—S. Vowles, Hotwells, Bristol, plasterer—J. Young, Lambeth-marsh, Surrey, victualler—W. Hooper, Reading, Berkshire, tobacco-manufacturer.

BANKRUPTCIES SUPERSEDED.—H. Nicholson and T. Baylis, Canterbury, railway-carriers—W. Bury, Blackburn, Lancashire, corndealer—J. H. Lowndes, Liverpool, merchant—J. Lockwood, Wakefield, linen and woollen-draper.

BANKRUPTS.—F. J. Osbaldeston, St. Alban's, horse-dealer—J. Bradshaw and G. Williams, Marylebone street, Piccadilly, woollen drapers—W. Crosby, B. Vallentine, and B. White, Houndsditch, London, hardwaremen—J. More, Coleman street, London, merchant—R. Marsh, Upholland, Lancashire, provision-dealer—T. Johnson, Liverpool, stationer—R. Sutton, Warrington, Lancashire, wheelwright—J. Cree, Devonport, draper—J. Peacock and T. Burton, Nottingham, cornfactors—G. Hibbert, jun., Chesterfield, Derbyshire, pawnbroker—E. Havard, Swansea, Glamorganshire, grocer—R. Elliott, Liverpool, wine-merchant—D. Blake, Norwich, mohair-manufacturer—E. Goddard, Holbeach, Lincolnshire, draper—W. Antill, Bourn, Gloucestershire, umbrella-stick manufacturer—W. and J. Wallis, Wragby, Lincolnshire, corn-merchants—J. Hill, Chichester, grocer—J. Rogers, Bromyard, Herefordshire, scrivener—J. Southern, Kidderminster, Worcestershire, victualler—D. Pope, Fenchurch-street, City, merchant—W. Chandler, Manchester-street, Gray's Inn-road, carpenter—J. Satterthwaite, Cullum street, London, wine merchant—G. Sherlock, Liverpool, ship broker—R. Sanderson, Leeds, corn factor—H. Capel, Coopers'-hall, Tower hill, wine and spirit merchant—I. Sealby, Keswick, edge-tool-manufacturer—W. Hounsfield, Manchester, commission-agent—R. Watson, Colne, Lancashire, worsted manufacturer.

SCOTCH SEQUESTRATIONS.—E. Sang, Edinburgh, civil-engineer—T., T. and D. Warren, Glasgow, glass-makers—D. Leech, Glasgow, land-agent—J. Cassels, jun., R. and J. Cassels, Kepp, Perthshire, distillers—J. Stewart, Blair Athol, farmer.

BIRTHS.—On the 30th ult., at Highbury-terrace, the wife of T. Flight, Esq., of a daughter—On the 26th ult., at Harting, Sussex, the lady of M. J. Philips, Esq., of twin daughters—On the 2nd inst., in Plymouth, the lady of C. Tanner, Esq., of a daughter—On the 1st inst., in Calthorpe street, Guildford-street, the lady of T. A. F. Reynolds, Esq., of a daughter—In Upper Harley-street, the lady of J. Morrison, Esq., M.P., of a son—On the 3rd inst., at Page-green, Tottenham, Mrs. W. Ward, of a daughter—On the 3rd inst., at Cleobury Mortimer, Shropshire, the lady of E. M. Moultrie, of the Middle Temple, Esq., barrister, of a daughter—On the 28th ult., at Ilchester, the lady of R. Henly, Esq., of a daughter—On the 1st inst., at Clifton, the lady of E. L. Walcott, Esq., of a daughter.

MARRIED.—On the 4th inst., at Greenwich, T. Wheatley, Esq., of Bexley-place, to Jane, youngest daughter of the late W. Wheatley, Esq., of Mona Cottage, Lewisham, Kent—On the 30th ult., at St. Pancras New Church, R. B. Hardy, Esq., of Gibson-square, Islington, to Fanny, 2nd surviving daughter of the late J. Abbott, Esq.—On the 4th inst., at Lambeth, J. Lynn, jun., Esq., of Fethard, Wexford, to E. Elizabeth, only daughter of T. Harrison, Esq., South Lambeth—On the 30th ult., at Camberwell, Thomas, eldest son of J. Foster, Esq., to M. Margaret, 2nd daughter of A. Lewis, Esq., of Dulwich.

DIED.—On the 27th ult., after a long illness, Mr. W. [illegible], of Upper Tooting, in the 77th year of his age—On the 28th ult., at Pentonville, Mr. R. Mudie, a well-known writer on natural history—On the 29th ult., at Hallow Park, near Worcester, Sir C. Bell, K.H., Professor of Surgery in Edinburgh—On the 3rd inst., at Oriel Lodge, Cheltenham, aged 71, Lieut.-Gen. Sir William Nicolay, C.B. and K.C.H., Col. 1st W. I. Regt., formerly Governor and Commander-in-Chief of Dominica, subsequently of St. Kitt's, Neva, Anguilla, and the Virgin Islands, and afterwards of the Mauritius—On the 23rd ult., aged 35, Julia Sophia Mary, wife of Lieut.-Col. the Hon. E. D. Pennant.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing, upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass, supplied in any number or quantity, at whole-sale prices.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

*** NUTT ON BEES (5th edition) now published.

IMPORTANT WORKS ON BOTANY AND GARDENING, published by Ridgway, Piccadilly; and to be had, by order, of every country Bookseller.

1.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols., beautifully coloured, price 25*s.* each.

2.

DR. LINDLEY'S BOTANICAL REGISTER. Published monthly, price 3*s.* 6*d.* each Number, containing Drawings from Nature of the newest and most beautiful Plants, with Directions for Cultivation, &c. &c. The volume for 1841 is now ready, price 2*l.* 2*s.*

"The Botanical Register, from containing most or all the new Plants introduced by the Horticultural Society, from the great care with which its plates are executed, and the judicious remarks on culture and general habit, by Dr. Lindley, is, in consequence, the superior publication."—*Loudon's Magazine of Botany, &c.*

"Too much praise cannot be bestowed upon this work."—*Horticultural Cabinet.*

3.

DR. LINDLEY'S SERTUM ORCHIDACEUM. A Wreath of the most beautiful Orchidaceous Flowers, in Ten Parts, price 25*s.* each. This splendid work is now complete, the Tenth Part being just published.

4.

DR. LINDLEY'S BOTANICAL HISTORY OF ROSES, with Coloured Plates, price 21*s.*

5.

DR. LINDLEY'S ACCOUNT OF THE BOTANY OF SWAN RIVER, with Coloured Plates, price 10*s.* 6*d.*

6.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS. Illustrated by Drawings on Stone, from the Sketches of Francis Bauer, Esq., F.L.S., &c. Complete in Four Parts, beautifully Coloured, price 30*s.* each.

7.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS, in 8vo, in Seven Parts, is now complete; and Subscribers are respectfully requested to make up their sets as soon as possible, several of the early Numbers being nearly out of print.

8.

DON'S EDITION OF SWEET'S CATALOGUE OF PLANTS, corrected to the present time, without Supplements. Price 21*s.* cloth boards, arranged.

"It certainly is the most complete and useful Catalogue that has yet appeared, as, in one line, it gives the systematic and English names, where described, of what country it is a native, the year introduced, the months when in flower, whether hardy or tender, its duration, and reference to the books in which it is figured; and where any names have been lately changed, a synonym is given in Italics, to show what it is changed from. It also contains nearly double the number of Plants contained in any other Catalogue that we have seen; so that, on the whole, we believe it could not have been more complete. In our opinion, the arrangement according to the natural system is far preferable to that of an artificial one, particularly for cultivators; and on this account the present work should be in the hands of all gardeners and cultivators of plants; and the reference to the figures will also render it very useful to the botanist.—*Gentleman's Magazine.*

9.

Sixth Edition, in one large vol. 8vo, price 16*s.*

SWEET'S BOTANICAL CULTIVATOR; or, Hothouse and Greenhouse Manual: giving full Practical Instructions for the Management of all the Plants cultivated in the Hothouses, Greenhouses, Frames, and Borders, in the Gardens of Great Britain; with Plain Directions for the Management of Bulbs and Plants in Rooms, &c.

"Indeed what Mr. Sweet has said on the Culture of Bulbs and Epiphytes, in the last Edition of his Botanical Cultivator, may be considered as the *ultimatum* on this subject for the British Gardener."—*Gardener's Magazine.*

This Edition corresponds with the New Edition of Sweet's Hortus Britannicus, and contains for the first time, Genus Orchidaceæ.

10.

THE FRUIT-GROWER'S INSTRUCTOR. By GEORGE BLISS, Nurseryman. Containing full Directions for Planting and Cultivating of Fruit trees; with Instructions for Forcing, and Lists of the best kinds of Fruit for every purpose: also Directions for Hothouse Building, and the most Improved Modes of Heating. Second Edition, enlarged, price 6*s.*

11.

THE FLORIST'S CULTIVATOR: or, Plain Directions for the Management of Florists' Flowers, Shrubs, &c.; select Lists of the most choice Flowers: to which is added the Monthly Operation usual for the Flower-garden, Shrubbery, and Greenhouse. By THOMAS WILLATS. Price 7*s.* 6*d.* coloured and bound in cloth.

Now ready, in 2 large vols. 8vo., illustrated with Plates, price 26*s.* cloth,

A COMPREHENSIVE HISTORY of the WOOLLEN and WORSTED MANUFACTURES, and the Natural and Commercial History of SHEEP, from the earliest records to the present period. By JAMES BISCHOFF, Esq.

London: Smith, Elder and Co., 65, Cornhill.

EVERY LADY HER OWN GARDENER.

Second Edition, with Wood-cuts, fcap. 8vo., 6*s.*,

PRACTICAL INSTRUCTIONS in GARDENING for LADIES, with DIRECTIONS for EVERY MONTH in the YEAR. By Mrs. LOUDON.

John Murray, Albemarle-street.

Just published, in royal 4to, half-bound morocco, gilt labels, price 16*s.*

SKETCHES FOR RUSTIC WORK; INCLUDING BRIDGES, PARK AND GARDEN BUILDINGS, SEATS AND FURNITURE. 18 plates—the scenic views in the tinted style of Zincography; with descriptions and estimates of the buildings. By T. J. RICAUTI, Archt. This work,—in addition to the Gate-lodge, Winter-house for Plants, Pigeon-house, Fishing-cottage, &c.,—contains a design for a Gardener's Cottage with Fruit-rooms, constructed exactly upon the principles advocated by Dr. Lindley in the *Gardeners' Chronicle* of Sept. 18th and Oct. 2nd, 1841. London: James Carpenter, Old Bond-street.

Just published, in 2 vols. 8vo. cloth, price 24*s.*

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.* Edward Moxon, Dover-street.

In 8vo, price 7s. 6d., Third Edition, improved, of

THE CULTIVATION of the GRAPE VINE on OPEN WALLS. By CLEMENT HOARE.

"Mr. Hoare has thrown more light on the subject of Vine culture than any British gardener who has written on the subject."—*Gardener's Magazine.*

"One of the best productions upon any horticultural subject which has been published for some years."—*Athenæum.*

London: Longman, Brown, Green, and Longmans.

BOTANICAL WORKS,

By Prof. LINDLEY, of Univ. Coll. and the Royal Institution.

1.

THE THEORY OF HORTICULTURE; or an Exposition of the Physiological Principles on which the Operations of Gardening are conducted. In 1 vol. 8vo. with Engravings on Wood, 12*s.* cloth.

2.

INTRODUCTION TO BOTANY. 3d Edition with Corrections and numerous Additions, 1 large vol. 8vo. with Six Copperplates and numerous Wood Engravings, 18*s.* cloth.

"We have no hesitation in pronouncing the 'Introduction to Botany,' by Dr. Lindley, to be the most valuable and perfect in any language we are acquainted with."—*Medical Gazette.*

3.

SYNOPSIS OF THE BRITISH FLORA, arranged according to the Natural Orders. 3d Edition, with numerous Additions, Corrections, and Improvements, 12mo. 10*s.* 6*d.* cloth.

BENEVOLENT INSTITUTION for the RELIEF of AGED and INDIGENT GARDENERS and their WIDOWS.—The Committee of this Institution hereby give Notice, that they have examined the Testimonials of the following Persons, and having found them satisfactory, nominate them as CANDIDATES for the ELECTION on JUNE the 2nd next, viz.:—

ANDERSON, JAMES, Gardener, 17, Regent-street, Mile-end-road, aged 70.

ATTLEE, SARAH, widow of William Attlee, at Mrs. Hates', Beddington Park Lodge, Wallington, Surrey, aged 71.

COLLYER, WILLIAM, Nurseryman, Horsell Birch, Surrey, aged 81 (second application).

PARROT, JAMES, Gardener, Maidstone, Kent, aged 74 (second application).

SUFFELL, WILLIAM, Gardener, 43, Park-place, Dorset-square, Marylebone, aged 66.

SUTTLE, THOMAS, Gardener, 38, Trafalgar-street, Walworth, aged 69 (second application).

J. J. BOWLER, Hon. Sec.

Crown and Anchor Tavern, Strand, May 3, 1842.

FOR THE FACE AND SKIN.

ROWLAND'S KALYDOR, a Preparation from Oriental Exotics, is now universally known as the only safe and efficient protector and beautifier of the Skin and Complexion. Its virtues are commonly displayed in thoroughly eradicating all Pimples, Spots, Redness, Tan, Freckles, and other unsightly cutaneous defects, and in rendering the most rough and uneven Skin pleasantly soft and smooth. To the Complexion it imparts the juvenile roseate hue, and to the Neck, Hand, and Arm, a delicacy and fairness unrivalled.

It is invaluable as a renovating and refreshing Wash, during travelling or exposure to the sun, dust, or harsh winds, and the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle, duty included.

CAUTION.—Ask for "ROWLAND'S KALYDOR," and see that these words are on the envelope, with their signature and address in *red*—"A. ROWLAND AND SON, 20, Hatton Garden, London;" the same are engraved on the Government stamp affixed over the cork.—Sold by them, and by respectable Perfumers and Medicine Venders.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, May 7, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND. The Anniversary Meeting will be held in London, at the Society's House, No. 12, Hanover Square, on Monday the 23rd of May, at 12 o'clock precisely. By order of the Council,
JAMES HUDSON, Secretary.

ROYAL BOTANIC SOCIETY OF LONDON.
Inner Circle, Regent's Park.

THE PROMENADES will take place in the Gardens on Wednesday, the 1st of June, from 4 to 7 o'clock, and will be continued on every following Wednesday at the same hours, if the weather permit, until further notice.

Visitors will only be admitted by the personal introduction, or written orders, of Fellows, strictly in conformity with the bye-laws and regulations of the Society.

By order of the Council,
May 4, 1842. JAMES DE CARLE SOWERBY, Sec.

UNDER THE PATRONAGE OF HER MAJESTY.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—A Grand Tulip and Miscellaneous Flower Show will be held at the Horns Tavern, Kennington, on Wednesday next, the 18th May.

A Band of Wind Instruments will attend. Open from 1 till 7, admission 1*s.* R. H. CUMING, Hon. Sec.

HIGHGATE HORTICULTURAL SOCIETY.—The FIRST EXHIBITION will be held on SATURDAY, the 21st MAY, 1842, in the Grounds of HOLLY LODGE, Highgate, by permission of His Grace the Duke of St. Albans. The Gates will be opened at Ten o'clock, and closed at Seven.

The band of the Coldstream Guards will attend.

Tickets, at 2s. 6d. each, may be obtained on or before the 20th inst. at Highgate, Hornsey, and Hampstead, or in London of the following seedsmen:—

Mr. Brown, Egyptian Hall, Piccadilly; Mr. Charlwood, Covent Garden; Mr. Kernan, Great Russell-street; Messrs. Warner and Co., Cornhill; Mr. Flanagan, opposite the Mansion House; Mr. Lockhart, Cheapside; and Mr. Nutting, Cheapside.

HEARTSEASE SHOW,
Under the Patronage of Sir John Sebright, Bart.

THE FIRST EXHIBITION of this SOCIETY will take place at Mr. Lidgard's, Thatched House Inn, Hammersmith, on Tuesday, the 31st inst.

1st Class, Amateurs and Gentlemen's Gardeners, 24 blooms.
2d do., Nurserymen, 36 blooms.

The President's prize of 3*l.* will be added to the 1st Prize in the 1st Class. Prizes will also be given for Seedlings, but no Seedling allowed to be exhibited in Stands.

Entrance 10*s.*, which will constitute a member. Entrance for Seedlings 1*s.* each Bloom. All flowers to be in the room by 11 o'clock. R. S. MOUNTJOY, Hon. Sec.
Ealing, 12 May, 1842.

THE SALT-HILL DAHLIA EXHIBITION, under the immediate Patronage of Her Most Gracious MAJESTY and His Royal Highness PRINCE ALBERT, will take place on the 16th SEPTEMBER, on the same grand scale as last year.
Particulars will appear in a future Advertisement.

CENTRAL PINK and HEARTSEASE SHOW, open to all England.—The above EXHIBITION will take place at the North Star Tavern, SLOUGH, on FRIDAY, JUNE 24, 1842; when numerous PRIZES, in PLATE, will be given on the same liberal scale as last year.—Schedules of Prizes, &c., may be had, on prepaid application. EDWARD AUGUST,
4, Regent's-place, Slough. Hon. Sec.

DANECROFT NURSERY, STOWMARKET.

SAM. GIRLING, impressed with a deep sense of gratitude to his numerous friends for the distinguished support he has this season experienced, begs leave to return his sincere thanks, and to inform them and Dahlia Growers generally, that he cannot take any further orders for Northern Beauty, Liberty, Louisa, or Sancho Dahlias this season. He has still strong and healthy plants of most of the approved varieties in cultivation, and in collections of 50 or 25. They will be sent to order at 6d. each, the choice being left to himself, and will be selected from choice favourite old sorts, to include a portion of newer varieties, in which he is plentiful.—Solicitous of future favours, he remains their obliged and obedient servant.—Plants to compensate for long carriage.——May 12, 1842.

GUANO MANURE.

W. SKIRVING, SEEDSMAN, QUEEN-SQUARE, LIVERPOOL, begs to announce to Landed Proprietors, and to Farmers and Gardeners, that the price of the genuine Guano has just been fixed by the importers as follows:—viz., 16*l.* per Ton for quantities under five Tons, and 15*l.* per Ton for any larger quantity.

W. S., from his experience with the Guano on various crops last year, and from the appearance of the crops of Grass at present where it was last year applied, can with confidence recommend it as a very good and, at the above price, a cheap Manure, for any garden or field crop. With this conviction, he has accepted an Agency for the Sale of the genuine Guano, and shall be happy to receive orders, which shall be promptly executed, direct from the Importer's Stores.

Terms of payment, ready money; a remittance or reference required.—Liverpool, 9th April, 1842.

ROSES.

MESSRS. PAUL and SON, FLORISTS, CHESHUNT, Herts, beg respectfully to offer for sale the undermentioned *select Dwarf Perpetual Roses,* which are kept in small pots for economy of carriage; and can be forwarded with ease and safety, at a trifling expense, to any part of the kingdom.

The Plants of all mentioned are now ready for delivery, with many other fine varieties.

CLASS 1st.—HYBRID PERPETUAL.

*Aubernon, brilliant dark rose, very sweet	£0	7	6

The varieties marked thus * are admirably adapted for planting in beds where whole beds of any particular colour are desired.

Messrs. PAUL and SON also beg to offer Dwarf Roses at the following prices, when the selection is left to them:—

Bourbon, China, Tea, &c., first-rate varieties, in pots	£1	4	0	per doz.
Do. do. do., good collection	0	18	0	,,
Do. do. do., good second rate	0	12	0	,,

They further beg to state that were the individual prices of the Roses considered in the above selection, they would amount to much more than the prices quoted per dozen.

Cheshunt, Herts, May 12, 1842.

EXHIBITION OF TULIPS.

H. GROOM, CLAPHAM RISE (late of Walworth), by Appointment FLORIST to Her MAJESTY, respectfully informs the Nobility, Gentry, and the Public, that his extensive COLLECTION of TULIPS is now in full bloom, and will continue in perfection until the 24th of MAY, and can be viewed every day, from 9 o'clock until 5, Sundays excepted.—Admittance 1*s.*

TO HEARTSEASE GROWERS. — JOHN BUXTON, Wandsworth Road, has Strong Plants of the best SHOW FLOWERS, by the most celebrated growers, including the late Mr. Baurraud's choice Seedlings, as well as his own. Flowers may be seen at Mr. Lake's, seedsman, Bishopsgate-street, City.

CHRYSANTHEMUMS. — CHANDLER AND SONS, Nurserymen, Vauxhall, London, beg to state that they have good plants, in small pots, of their CHRYSANTHEMUMS now ready to send out, and that they can supply the Jersey varieties at 12s. per dozen, different sorts, and also the French and Spanish varieties at 18s. per dozen.

A list of their collection may be had on application; if by letter, prepaid.

J. KEYNES, FLORIST, SALISBURY, begs to state that the following (with all the established Show Flowers of the Season) are now ready for delivery with his usual fine Plants. To all growers, he has no hesitation in confidently recommending them as decided improvements. *The Yellow stands at present unrivalled,* and will be indispensable to a first-rate stand. Should either of the following not prove Show Flowers, they will be deducted from accounts.

Prince of Wales (Dod's), pure yellow, most perfect shape	10*s.* 6*d.*
Twyford Perfection (Young's), puce, edged crimson	10*s.* 6*d.*
Westbury Rival (Hall's), puce, extra fine form	10*s.* 6*d.*
Prince Albert (Adam's) shaded bronze, new colour	10*s.* 6*d.*

Salisbury, April 30, 1842.

NEW AND SUPERB FUCHSIAS.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the NEW FUCHSIAS sent out by various parties, which they have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they are now ready to be sent out at the rate of 21*s.* per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post-free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, May 4th, 1842.

SCOTTISH CRYPTOGAMIC PLANTS.—For Sale, a few Packets (all similar) of Mosses, Lichens, and Hepaticæ, each containing 120 species, carefully dried and named, including the very rare BUXBAUMIA APHYLLA, DIDYMODON INCLINATUS, and other rarities, price 10*s.* Can be posted to any part of the Kingdom. Early application is requested, addressed Wm. Gardiner, Jun., 40, Overgate, Dundee.

CHEAP SHOWY PLANTS FOR FLOWER-BEDS.

WILLIAM BARRATT begs to offer to Floriculturists, as below, CALCEOLARIAS, GERANIUMS, VERBENAS, FUCHSIAS, PANSIES, DAHLIAS, and other free-blooming Garden Flowers, at 4*s.* to 6*s.* per dozen; strong Plants ready for planting out. A fine collection of the above plants in named sorts, as well as other Greenhouse and Herbaceous plants for Rooms and Greenhouses.

About 10,000 GREENHOUSE HEATHS and EPACRISES, in fine health; worthy the attention of the Amateur and Nurseryman.

⁂ NATURAL GRAPES for permanent pasture, in selected sorts. Persons ordering these should give the quantity of ground, the situation and quality of the soil, and for what purpose wanted; doing this they may rely on having the proper kinds, and at not above one-third more expense than the old mixtures of Hay-seeds, which are very uncertain in producing good Herbage. Also, DWARF LAWN GRASSES; as much seed as will sow 100 square yards for from 3*s.* to 4*s.*

Wakefield Nursery, May 1842.

CHAPMAN'S NEW SPRING POTATOES.—This excellent new variety, possessing all the qualities of the best Ash-leafed Kidney, but capable of being produced in perfection for table from November till June, is now ready for delivery at One Guinea per bushel, with directions for their culture in the open ground without protection.

"We never yet tasted any forced or retarded Potatoes anything like so good."—Dr. Lindley, in *Gardeners' Chronicle.*

"We can only repeat, that, be they what they may, they are of excellent quality."—Dr. Lindley, in *Gardeners' Chronicle,* Apr. 2.

⁂ Orders for sample baskets, enclosing 1*s.*, will be attended to; but orders for sets must be prompt—addressed to T. H. Chapman, Brentford-end.

THE NEW MANURE—FIXED AMMONIA.—This highly-fertilising matter is strongly recommended to Agriculturists, Gardeners, and others, for its unequalled powers in promoting the healthy and rapid growth of Grass and Vegetables; whilst its portability renders it invaluable in situations where the cost of conveyance bars the use of ordinary stimulants. It is free from smell, and dissolves instantly in pure water; it may be used in Field, Garden, or Conservatory with equal advantage; the results of experiments already tried are most satisfactory; and there is no doubt of success wherever it may be applied, as it is equally adapted to every description of soil.

To be had from Mr. T. EYTON, Manufacturing Chemist, Blackstock-street, Liverpool, in quantities of one cwt. and upwards.—Instructions for its use will be forwarded with each parcel.

TO PINE GROWERS AND FORCING GARDENERS.

TAN may be procured in the immediate vicinity of Covent-Garden Market, on the same terms as in Bermondsey. For further information apply to Mr. Bagshaw, News Agent, 31, Brydges-street, Covent-Garden.

UNDER THE ESPECIAL PATRONAGE OF
HER ROYAL HIGHNESS THE DUCHESS OF GLOUCESTER AND
HIS ROYAL HIGHNESS THE DUKE OF CAMBRIDGE.

M. WATERER begs leave respectfully to inform the Nobility and Gentry of London and its environs that his unrivalled COLLECTION of AMERICAN PLANTS will open on WEDNESDAY next, MAY 18, at the King's Road, CHELSEA, upon a much more extensive scale than that of last year. M. W. flatters himself it will merit and meet the patronage of the Public. —Open from 10 till dusk. Admittance 1*s*. each.—At the Nurseries, Knap Hill and Bagshot, the American Plants are also in bloom, and may be viewed gratis. The Knap Hill Nursery is 2½ miles from Woking Station, South Western Railway, where conveyances may be had.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will Sell by AUCTION at the Mart, Bartholomew Lane, on Tuesday, May 17th, Thursday, 19th, and Friday, 20th, 1842, at 12 o'clock, about 2000 Dahlias, consisting of all the leading kinds; also fine Geraniums in bloom, New Verbenas, Fuchsias, Heartsease, &c.

May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, Leytonstone.

MR. T. ANSELL, Jun., is instructed to sell at the AUCTION MART, Bartholomew Lane, on Tuesday, May 17, 1842, at 12 o'clock, a most extensive and splendid Collection of DAHLIAS, embracing nearly all the new varieties coming out this season. Also a variety of Plants suitable for turning into Flower-borders, &c. &c.

BRITANNIA LIFE ASSURANCE COMPANY,
1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l*. for whole term of Life.

Age.	Annual Premium payable during				
	1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.

PETER MORRISON, Resident Director.
A liberal commission allowed to Solicitors and Agents.

NEW ZEALAND COMPANY.—NOTICE IS HEREBY GIVEN, that the ANNUAL GENERAL COURT OF PROPRIETORS OF THE NEW ZEALAND COMPANY will be holden on TUESDAY the 31st day of MAY inst., at One o'clock precisely, at this House, for the election of Directors and other Officers of the said Company, and for the transaction of other business. At the said Meeting, the following Directors will go out of office, viz.—

Viscount INGESTRE, M.P.
Sir WILLIAM MOLESWORTH, Bart.
ARTHUR WILLIS, Esq.
JOHN ELLERKER BOULCOTT, Esq.
JOHN WILLIAM BUCKLE, Esq.
HENRY AGLIONBY AGLIONBY, Esq., M.P.

But being eligible for re-election, hereby offer themselves to be re-elected accordingly. By order of the Court,

JOHN WARD, Secretary.

New Zealand House, Broad-street Buildings, 13th May, 1842.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronised their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l*. 5*s*. and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*) with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden stand Frames, Engines, Watering pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,
Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

GARDEN-NETS, FISHING-NETS, SHEEP-NETS.

GARDEN-NETS, being new steam-made Net, 1½d. per yard, 1-inch mesh; do. Mended Fishing Nets, ¾d. per yard; New Hemp Net for shading Greenhouses, Heaths, &c., and for protecting Peaches, &c., from Wasps and Flies, 7½d. per yard, 38 inches wide; Worsted Net, Woollen Nets, Fishing Nets, from 4 to 400 yards long, ready for use. Drags, flues, trammels, New Cotton Flue Nets (kill fish best of any kind of material), 3s. per yard, 6 feet deep. Sheep Nets, strong-tarred cord, forming a neat invisible fence, or for folding sheep, 4½d. per yard, 3½ feet high. New Expanding Tents, 36 feet round, 6 feet high in lowest part, put up or taken down in three minutes, 5*l*., made of Russia Duck, striped canvas, or the finest Brown Holland; if made 24 feet round, same height, 3*l*. 15s. They form a neat summer-house for a garden, useful ornament for lawns; and for Fishing, Shooting, Archery, or Pic-nic parties, are worthy of notice. Weight of the largest only 20 lbs.; if made of thick canvas, no difference in price.

Robert Richardson, Net, Tent, and Rick-cloth maker, 21, Tonbridge Place, New Road, near Euston-square.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing, upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass, supplied in any number or quantity, at wholesale prices.

A CURATOR WANTED.—The Botanical Society of London is in want of a CURATOR to arrange the Collection; he will be required to attend Three Days a Week, from 10 to 4.—Apply by Letter, pre-paid, to Mr. G. E. Dennes, Secretary, 20, Bedford-street, Covent Garden.

A LADY who has just parted with her GARDENER, in consequence of having relinquished her Country Establishment, on account of a death in the family, wishes to recommend him to any Nobleman or Gentleman who may be in want of a person in whom the utmost confidence may be reposed, and whose abilities as a Gardener, and whose general conduct, she feels assured will not fail to give the greatest satisfaction.—Address A. R., Cormack and Co., Bedford Conservatory, Covent-garden, London.

TO NOBLEMEN, GENTLEMEN, AND FARMERS.

WANTS a SITUATION, as FARM BAILIFF, in any County in England, a Young Man, a native of Cumberland. The advertiser has been brought up to Farming and Grazing, and is acquainted with most of the modern improvements in agriculture; and would be able to give respectable references, and produce sufficient testimonials as to character and capabilities.—Address A. L., Post-office, Brampton, Cumberland.

WANTS a SITUATION as UNDER GARDENER, a Young Man, who wishes to place himself under a Head Gardener, and will be found very willing to oblige. He can have an undeniable character, and he has been accustomed to work in the Garden.—Direct to R. R., at Mr. Russell's, Gardener, Croydon Common.

WANTS a SITUATION as GARDENER, or GARDENER and FORESTER, and where at least two men are kept as labourers, a Married Man, without a Family, aged 30 years. He has a thorough knowledge of his business in all its branches, is a good accountant, and can be highly recommended by his late employers. Wages 55*l*. per annum, with a cottage, &c. His Wife can superintend the management of the Dairy and Poultry. No objection to go to any country, provided more salary be given.—Address H. K., at the Office of this Paper.

TO NOBLEMEN AND GENTLEMEN.

WANTS a SITUATION as GARDENER, a respectable Young Man, who understands his business in every department, and can be highly recommended. Salary 80*l*. per annum. Letters addressed, pre-paid, A. B., Post-office, Bognor, Sussex.

WANTS a SITUATION as GARDENER, a respectable Married Man, 30 Years of age, who understands his business in all its branches. His Wife, if required, can take charge of a Dairy, or the Family Washing. Can have a good two years' character from the place he is about leaving.—Direct R. W., Mr. Cuthbert's, Nursery and Seedsman, Southgate.

WANTS a SITUATION as GARDENER, a Middle-aged Man, without incumbrance, who thoroughly understands his business. Can have a good character from the place he has just left, where he lived seven years. No objection to the charge of Cows, Closes, &c. Wages not an object.—Address A. B., 52, Curzon-street, May Fair.

WANTS a SITUATION as GARDENER, a Married Man, without Family, who perfectly understands all kinds of Forcing, Kitchen Gardening, and Plants. His Wife has no objection to the management of a small Dairy, if required.—Direct to Mr. Mills, Gunnersbury Park, Acton, Middlesex.

WANTS a SITUATION as GARDENER, a Single Man, aged 28 Years, who has a thorough knowledge of his business, and can have an undeniable character from his last place. Reasons for leaving—his Master requiring a Married Man, on account of a new Lodge being built. Wages, 1*l*. 2*s*.—Address, P. P., J. Cuthill, Florist, Love-walk, Camberwell, London.

WANTS a SITUATION as GARDENER a respectable Single Man, aged 28, of sober and industrious habits, who has a general knowledge of his profession, and whose character will bear the strictest inquiry.—Apply by letter, addressed to C. D., Mr. Russell's, Gardener, Turnham Green, Middlesex.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

*** NUTT ON BEES (5th edition) now published.

FOUNTAINS, &c.—AUSTIN and SEELEY respectfully offer their services to the Nobility and Gentry who may purpose introducing Ornaments of this nature in their Parks or Gardens. Having accumulated during the last 15 years a large number of Models, they are enabled by various combinations to construct FOUNTAINS in very great variety, and at a lower price than formerly. As their stock of Vases, Statues, Sun-dials, Flower-boxes, Fonts, and other objects for Ecclesiastical purposes, comprises altogether more than a thousand varieties, they hope to be able to meet the wants of most persons who may apply to them.—New-road, corner of Cleveland-street.

THE AWFUL EFFECTS of FIRE might often be prevented by a few gallons of water, if at hand at its first breaking out; but for want of which, both Life and Property frequently fall a sacrifice, to a fearful extent. J. READ begs to inform the Public, that he has invented a FIRE ENGINE upon an entirely new principle, so portable, that it may be kept in a house, carried up or down stairs, and, worked by two men, will discharge 20 gallons per minute to a distance of 70 feet, and with four men may be continued for any length of time. To render the above more generally useful, it is so arranged, that, by shifting a single pin, it may be worked by one man with ease for all HORTICULTURAL PURPOSES, which the Patentee, from 31 years' practical experience in that science, and 21 years in manufacturing and improving Engines, can safely warrant. Price 18 guineas.—May be seen and proved at the Patentees, 35, Regent-circus, Piccadilly.

AT the suggestion and request of many Country Gentlemen, Mr. PAXTON'S COTTAGERS' GARDEN CALENDAR has been reprinted in the form of a small volume, for general distribution. The price is 3*d.* each copy; and it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies required.

The Gardeners' Chronicle.

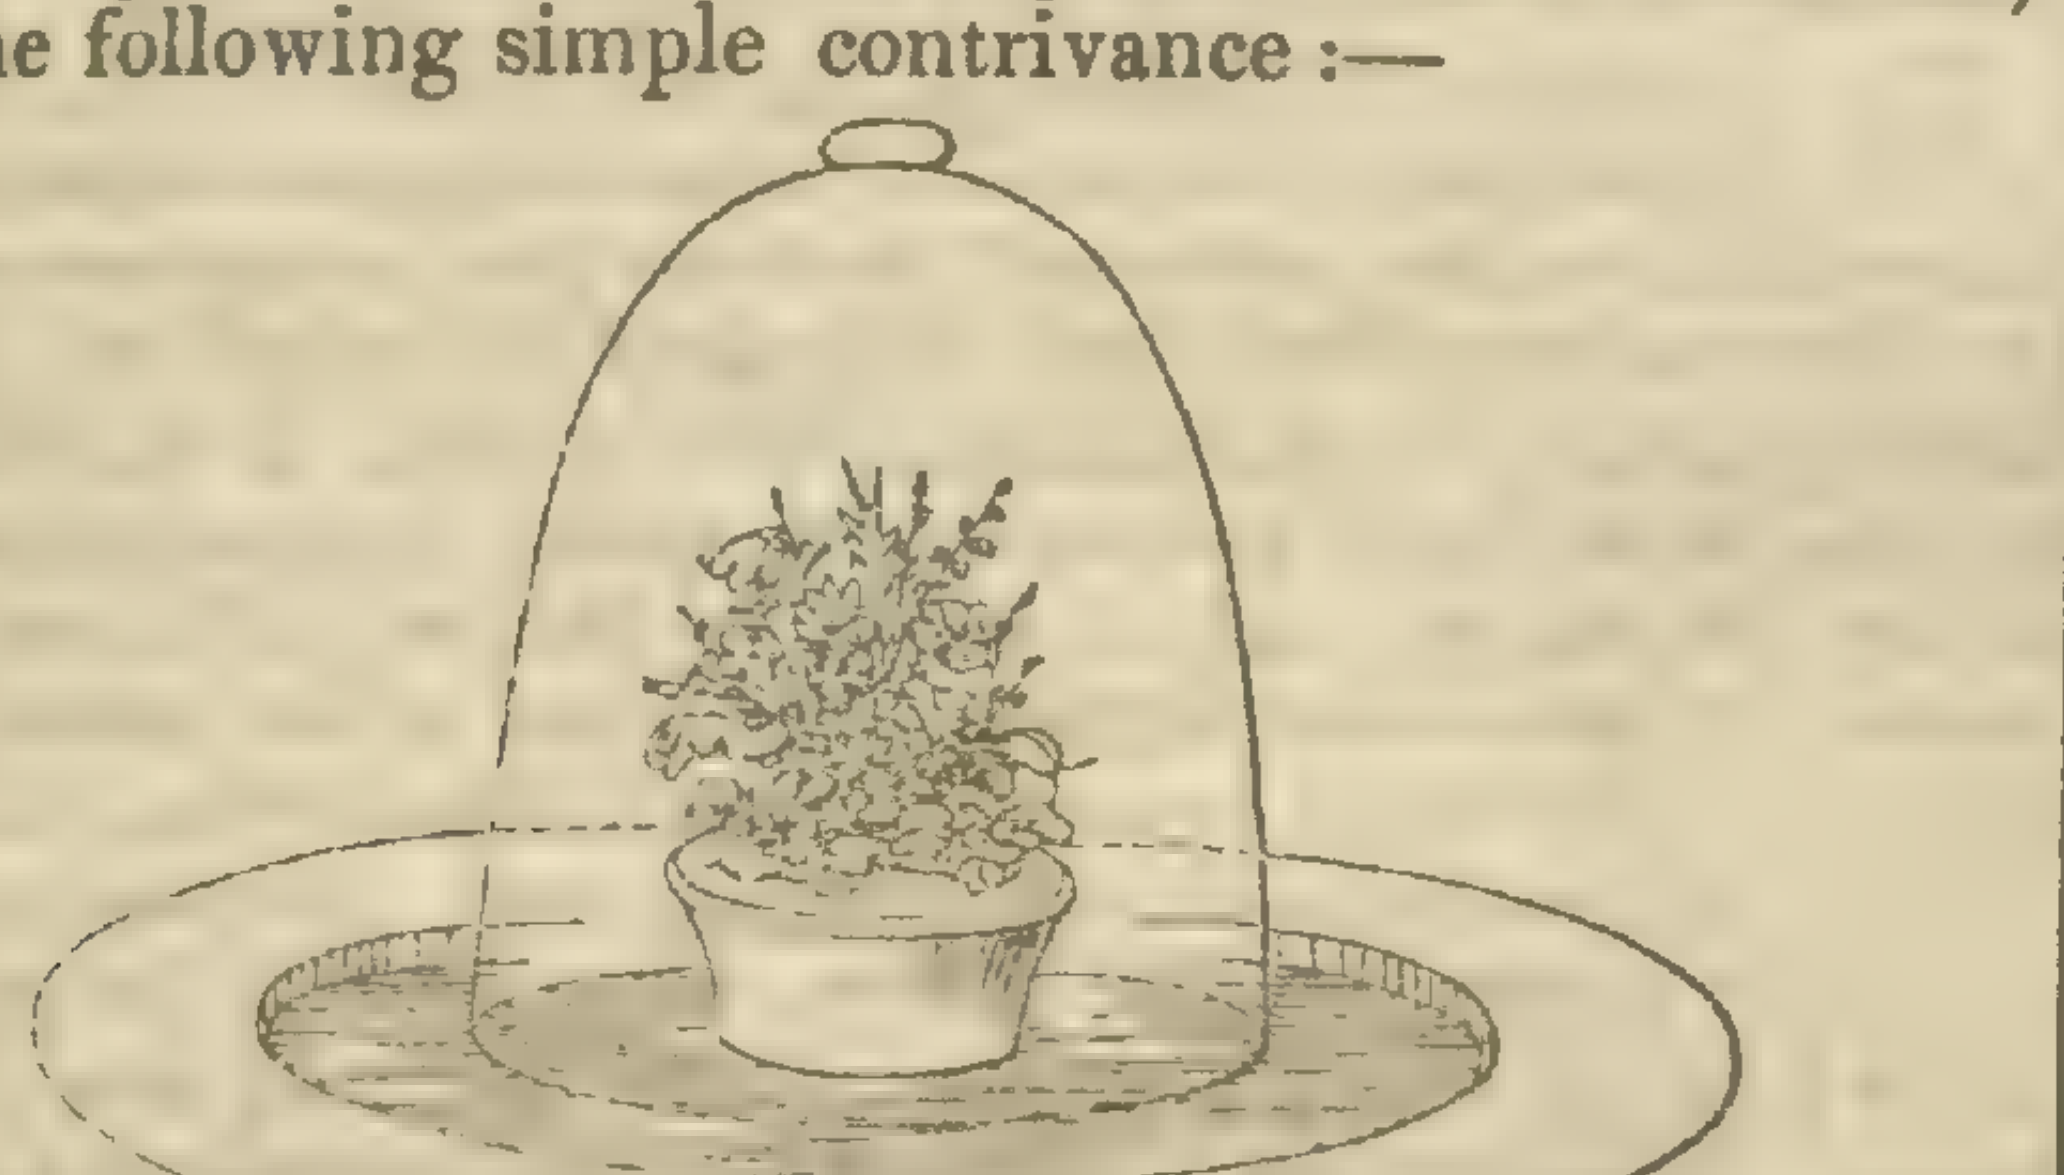
MEETINGS IN THE ENSUING WEEK.

Tuesday	Floricultural	7½ P. M.
Wednesday	Geological	8½ P. M.
Friday	Botanical	8 P. M.

COUNTRY SHOWS.—May 18, High Wycombe Horticultural and Floricultural.

IT is now, alas! a long eighteen years ago since we first saw, in the drawing-room of a gentleman now no more, in the hot, dry weather of the Dog-days, flowers preserved day after day in all their freshness, by the following simple contrivance:—



A flat dish of porcelain had water poured into it. In the water a vase of flowers was set; over the whole a bell-glass was placed with its rim *in* the water. This was a "Ward's case" in principle, although different in its construction. The air that surrounded the flowers, being confined beneath the bell-glass, was constantly moist with the water that rose into it in the form of vapour. As fast as the water was condensed, it ran down the sides of the bell-glass back into the dish; and if means had been taken to enclose the water on the *outside* of the bell-glass, so as to prevent its evaporating into the air of the sitting-room, the atmosphere around the flowers would have remained continually damp.

What is the explanation of this? Do the flowers feed on the viewless vapour that surrounds them? Perhaps they do; but the great cause of their preserving their freshness is to be sought in another fact. When flowers are brought into a sitting-room, they fade, because of the dryness of the air. The air of a sitting-room is usually something drier than that of the garden, and always much more so than that of a good greenhouse or stove. Flowers when gathered are cut off from the supply of moisture collected for them by their roots, and their mutilated stems are far from having so great a power of sucking up fluids as the roots have. If, then, with diminished powers of feeding they are exposed to augmented perspiration, as is the case in a dry sitting-room, it is evident that the balance of gain on the one hand by the roots, and of loss on the other hand by their whole surface, cannot be maintained. The result can only be their destruction. Now, to place them in a damp atmosphere is to restore this balance; because, if their power of sucking by their wounded ends is diminished, so is their power of perspiring; for a damp atmosphere will rob them of no water. Hence they maintain their freshness.

The only difference between plants in a "Ward's case" and flowers in the little apparatus just described consists in this—that the former is intended for plants to grow in for a considerable space of time, while the latter is merely for their preservation for a few days; and that the air which surrounds the flowers is always charged with the same quantity of vapour at all times in the dish and bell-glass, while in a "Ward's case" the quantity of vapour will vary with circumstances, and at the will of him who has the management of it.

For the sake of distinguishing this little contrivance now described, we shall in future call it the "Hopean apparatus," under which name we shall soon have occasion to speak of it again. In the mean while, we recommend those who love to see plenty of fresh flowers in their sitting-rooms in dry weather to procure it. The experiment can be tried by inserting a tumbler over a rose-bud in a saucer of water.

THE Poor Laws of England have been productive of more bad feeling than any other legislative enactments. In all their many shapes, they have succeeded in one thing only, that of producing discontent. They are oppressive to the landowner who pays for them; they are unwelcome to the pauper for whose maintenance they have been devised: so that without in any way taking part in poor-law or anti-poor-law discussions, with which we have nothing to do, we may safely assume that men of all parties would be glad to see something better substituted for the existing Poor Laws. Unless, however, there should be a certainty that all classes would be gainers by the change, for what is the interest of the rich is equally that of the poor, there could be no intelligible purpose in again disturbing the existing order of things.

It has always appeared to us that the vice of our Poor Laws resides in the principle of maintaining the destitute poor by forced contributions unwillingly doled out to them, instead of enabling them to maintain themselves; and that the labour to which paupers are subjected in the Workhouses, or by the parish authorities, partakes so much of the nature of prison labour as to be distasteful to them in the extreme. It may not be possible to devise a means of rendering paupers their own supporters; but it will be admitted that if it were possible, nothing could be more desirable, or would more quickly tend to restore to our labourers that self-respect and independence of character which the workhouse too surely destroys.

In the opinion of Mr. Morrison, the author of a pamphlet called "Proposals to abolish all Poor Laws, except for the Old and Infirm," it is practicable to do this; and we are sure our readers will be glad to know in what way such an end is to be accomplished. The plan of this gentleman consists in the establishment of "Asylum Farms," that is to say, farms to be worked exclusively by paupers, who are to give their labour in exchange for their food and clothing, and who are to be stimulated to exertion and good conduct by partaking in the eventual profits.

"There are two arguments," says Mr. Morrison, "on which I shall rely for the favourable consideration of my proposals. The first is, the duty we owe, as Christians, to the express commands of God; the second is, the plain dictates of common sense, to avoid the fearful outlay of money for supporting the destitute, which at present exists, if it can be shown to be wholly unnecessary. To enable any person, who may be but little accustomed to consider the subject, to appreciate the importance of the object proposed in the latter point of view, I will take, as an example, the Sevenoaks Union, which, by official returns, was reported to contain, during the winter of 1840, an average of 325 persons, maintained by the poor-rates; of whom only 60, that is, 18·4 per cent., were old and infirm, or, in other words, incapable of obtaining their own maintenance by their own labour. It will be evident that, if these poor persons cost the union 10*l.* each per annum, which is probably much below the average cost of the poor throughout the land, the yearly tax on the property which supports the union of Sevenoaks will be 3,250*l.* And it is also evident that, if the 'old and infirm' only were to be maintained by that union, the expense would be only 600*l.*; showing a saving to the rate-payers of Sevenoaks of 2,650*l.* a-year, which may be clearly seen to denote a rate for the poor of about 10*d.* in the pound, where it may now be 5*s.*; or the payment of 3*l.* 5*s.* 9*d.*, where the present payment, by an individual, may be 20*l.* a-year.

"The importance of the saving to the nation will be very striking, if we consider that the whole number of the destitute labouring poor, including the children dependent on them, may be 1,200,000; as this, at 10*l.* a-head, implies a dead weight of twelve million pounds annually on the country! But the amount of benefit to the country, involved in the proposals contained in these pages, is not confined to the negative saving, as it will be discovered that I show, not only that the destitute poor may be enabled to provide for their own maintenance, but that they will become 'producers,' instead of idle consumers: and whereas they are now the drones, they may be the honey-bees of the national hive; for it will appear, that not only will each of these 1,200,000 poor be provided for by the produce of their own indnstry, but that each will have an average of nearly 3*l.* yearly to expend in the country, one-half of which may be expected to be expended on articles that pay customs or excise duties of the highest class, such as tea, &c. This would yield an increase to the revenue of 900,000*l.*; and as the estimate of their expenditure is 6*s.* a-year in sugar and spices per person, this would amount to 360,000*l.*, of which 100,000*l.* may be considered as duty; wherefore, the total increase to the revenue would be 1,000,000*l.* But as the amount now expended on the poor is chiefly spent on the commonest articles of diet, &c., which do not pay any extensive duties, and as the money saved would be chiefly spent in little luxuries, such as wine, tea, &c. by the rate-payers (we may suppose, at least, that two-thirds of it would be so expended), if these pay only 25 per cent. there would be an increase farther of 2,000,000*l.*, giving a total increase of revenue equal to *three millions* annually.

"The case will then stand as follows, if we assume the labouring poor, including their children, who are maintained by the poor-rates, to be 1,200,000:—

To amount saved directly on 1,200,000, at 10*l.* each	£12,000,000
To 3*l.* surplus produce beyond the cost of their support	3,600,000
To increase of revenue, and thereby remission of taxes	3,000,000
Total benefit to the country .	£18,600,000

"It will be admitted by all, that if even a moiety of this amount can be saved to the country, a great national benefit will be accomplished, independent of the advantage to the poor, of being rescued from demi-starvation, to be placed in the lap of plenty; but I believe it will be found that the poor cost the nation 25 per cent. beyond the sum here estimated, and of course that per-centage will, in that case, be added to the gain. But, if we regard the effects on the criminal statistics of the kingdom, by the abolition of the poor-rates and present wretchedness of the unemployed poor, which drives vast numbers into crime, we may assuredly assume, that the country would save a much larger sum than what is here represented. This ought to be an inducement to all classes to take my proposal into consideration."

We cannot find room for the details of the plans by means of which these asylum farms are to be created, organised, and maintained. We must content ourselves with stating that Mr. Morrison is of opinion that the produce of such farms will defray all the expenses, and leave a surplus for the final division among those who are employed upon them. He estimates the profits upon a farm of 162 acres, beyond the consumption of 200 residents engaged in cultivating it, at 1,364*l.*; labour and manure, the great items of charge on a farm, costing nothing. The expenditure for superintendence, rent, tithe, sugar, coals, &c. &c., he places at 764*l.* The assumed profits, amounting to 600*l.*, he proposes to divide into two portions—four-fifths as a reward for labour, and one-fifth as a reward for talent; all which is to be distributed rateably among the inmates of the farm.

If these results can really be obtained, no one will for a moment dispute the desirableness of instituting Asylum Farms; in which voluntary and varied labour is to take the place of forced and joyless exertion. As the author truly says—

"The dreadful monotony of ordinary labour is the chief cause of the weariness and disgust it creates. 'Labour is a law of nature, a divine law. The fate of man upon the earth is evidently to cultivate it, to embellish it, at the same time that he provides for his wants and creates his enjoyments,' observes a celebrated French writer. And he asks, 'how is it, labour is so repulsive?' Let us look about, let us take nature as she is, and we shall see that labour is repugnant, when it is forced, arbitrary, obligatory; when it is continuous and monotonous; when it is isolated, without rivalry or emulation. The peasant who works alone in his field for twelve hours, stimulated only by the acquisition of a morsel of bread; the workwoman, who, alone in her garret, plies the needle the whole day and part of the night, stimulated but by the necessity of earning a livelihood; the clerk, who grows pale over an ungrateful task, tied for twelve hours to his office, procuring neither honour nor advancement, but solely his meagre salary at the end of the month; these cannot but have a strong repugnance for their daily labour. But alter some of the accessories to the same labour, and it at once becomes less repulsive. The reapers and vintagers, assembled together, animate each other by joyous songs, and compete in skill and promptitude. Such labours are not painful; on the contrary, they are attractive. Indeed, it has been truly observed, that 'all voluntary labour is attractive;' and I believe it is not only true, that 'idleness is contrary to nature,' but that it is only the result of unnatural and ill-judged arrangements in the application of the labour to the labourer. No; labour is not in itself repugnant, as every one creates for himself some labour under the guise of amusement. It is the miserable circumstance, that seven-eighths of mankind who labour are averse to their vocations, which renders men occasionally idle. The perpetual recurrence of the same work—the monotony of recommencing in the morning the same labour that was quitted in the evening—this it is which disgusts. And the more weary he becomes, the less his intellectual faculties are aroused, the more he becomes a mere machine. Even what is called pleasure, if carried too far, readily produces *ennui.* The taste for variety is natural, and in all men is more or less developed; while in some it is the master-passion, and requires control. It is consonant, therefore, with true philosophy to consult this natural taste, as, by so doing, we insure voluntary labour, which carries with it intellectual exertion; and we may thus rely on a more profitable application of labour, which is the object we have to obtain."

For ourselves, we confess our opinion of human nature to be less favourable than that of Mr. Morrison; and we see many practical obstacles to the working out his plans. The extreme difficulty of obtaining good superintendence, on which everything would depend—the impossibility of apportioning profits, supposing there were any, to individuals whose periods of employment were less than a year, to say nothing of any other sources of embarrassment, do not seem to us to have been sufficiently considered by him. The amount of profit, indeed, would probably be less than nothing. But that should not discourage the humane in trying the experiment thus recommended. A few hundred pounds would be sufficient to make the attempt, which is just one that a government should undertake. The mere keeping paupers contented would in itself be a great point gained; and if the assumed profits had to be furnished by a rate, instead of arising out of the farm, still the money would be infinitely better expended than in any of our present schemes. We quite agree with Mr. Beckett, as quoted by the author of the pamphlet before us, that prosperity will never be reached and maintained in this country without a provision for the *regular employment* of the poor.

WE are reminded by a correspondent that the strength of Asparagus plants is impaired by the quantity of berries they are allowed to bear, and that it would be far better to remove them. This is no doubt true; for every berry that is formed is organised out of matter which, if not so employed, would be sent downwards into the roots, to contribute to their vigour. By all means, then, destroy the flowers of the Asparagus as soon as they appear, unless it is really desirable to obtain a crop of seed.

NEW MOWING MACHINE.

HAVING had to answer so many inquiries from neighbours respecting the merits of an improved machine for mowing lawns, I cannot help thinking an account of it would prove interesting to many of your readers; and it will gratify me if you will accept the communication, as an acknowledgment of the satisfaction and benefit I derive from the perusal of your ably-conducted journal.

The machine in question is nothing more than an application to the cutting of grass of an invention long in use for the shearing of velvet. The idea of this application is still the subject of a patent, in England, in favour of a Mr. Budding, the inapplicability of whose machine to large spaces had long been a subject of regret to me.

The accidental discovery that the patent had been taken for England only, led to my employing a very ingenious mechanic in my neighbourhood (Mr. Shanks, of Arbroath) to construct the implement I first used. His success was complete, and I have had the experience of a whole season to test it. My lawn (consisting of nearly 2½ acres) was cut weekly, all last year, by one man, aided by a small pony, in a style not to be surpassed, if equalled, by the best scythesman. The breadth commanded was 27 in., and about eight hours were expended in going over the whole. Two men could draw the machine easily; but finding the horse's feet, when working (as answers best in dry weather), left no permanent mark on the grass, I preferred the latter: it is guided by leading-reins. During the season no repairs of any kind were required; and I do not think that even sharpening will be necessary until after several years' repetition of similar work.

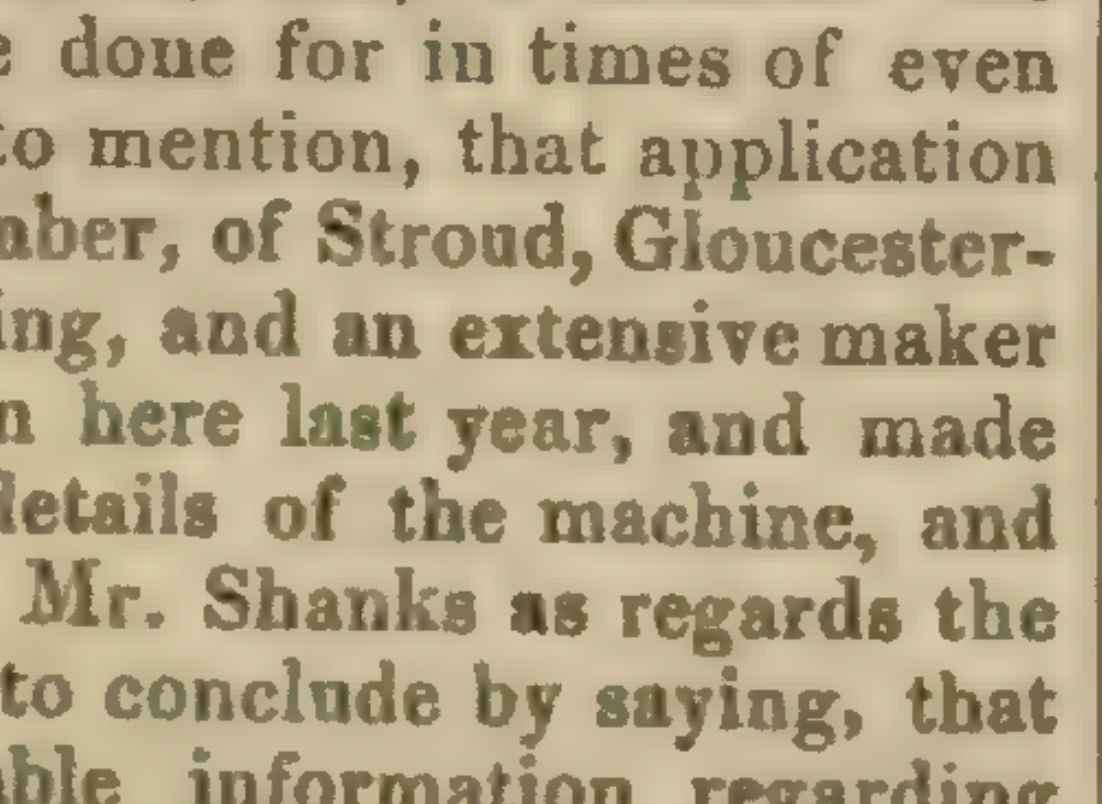
This success suggested a further improvement with a view to economy, viz., the giving the machine weight enough to act as a roller, and, at the same time, increasing the cutting breadth. The new machine, which commands 42 inches (and of which I enclose you a calotype representation, by a novitiate in the exercise of that promising invention of Mr. Talbot's), has been just tested, and its success surpasses my expectation. The lawn of 2½ acres is now cut, the grass swept up, and the ground effectually rolled by my gardener, assisted by the pony, in 2¼ hours; and the execution, particularly where there is a good sward, leaves nothing to be desired. When the ground is much fogged, a surface is produced very similar to velvet.

Mr. Shanks has added a revolving brush, for the purpose of better delivering into the cutters the grasses, which are found occasionally reclining horizontally: it works well, and enables a higher sward to be removed at one operation; but these cases are, or ought to be, of unfrequent occurrence: this apparatus is easily detached. The economy effected may be easily estimated by any one; I shall not, therefore, go into the detail of its calculation: it is simply the whole expense in labour of scything, minus the difference in interest of capital invested in the machine, and in roller, scythes, rakes, &c. I paid 18*l.* for the first machine; and I understand the cost of the new one (were there several to be made) would not much exceed 20*l.*; but for this I must refer parties to Mr. Shanks himself, who, in the present extraordinarily depressed state of the machine-making business, will, I doubt not, be but too happy to attend to any orders he may be favoured with. Looking to the accuracy of the execution, the weight of material, &c., I consider the price as lower than it could be done for in times of even ordinary prosperity. I ought to mention, that application may also be made to Mr. Ferraber, of Stroud, Gloucestershire, the agent for Mr. Budding, and an extensive maker of machinery. He came down here last year, and made himself acquainted with the details of the machine, and has, I believe, arranged with Mr. Shanks as regards the English patent. I have only to conclude by saying, that if I have omitted any desirable information regarding what I cannot help thinking will be found a useful as well as economical improvement, I shall be happy to supply it through the same medium.—*W. F. Lindsay Carnegie, Kimblethmont, Arbroath.*

ON THE CONSTRUCTION AND MANAGEMENT OF A HEATHERY.

(Continued from page 141.)

THE Heathery should be constructed so as to admit plenty of light and air. A house with what is commonly called a lean-to roof will answer the purpose, providing it is well ventilated and the plants are kept near the glass; but one with a span-roof, with moveable top and front sashes, will perhaps be better and more convenient. The annexed transverse section will give an idea of its construction. When the house is building, the means of getting a constant and plentiful supply of rain-water should not be lost sight of. In a small one, slate tanks will answer the purpose, and can be erected under the stages or front shelf; if very large, a long tank may be made of bricks and cement along each side under the hot-water pipes, in the same way as in the large conservatory at Chiswick; in either case the tanks must, of course, communicate with the gutters of the roof. The water of many springs, as I mentioned before, produces the worst effects upon Heaths; not only, therefore, is there a great deal of labour saved by having a constant supply of rain-water in the house, but it is always near the temperature of the soil in which the plants grow, and does not hold in solution any substance deleterious to them; besides, the extra expense of constructing tanks is comparatively trifling.



The hot-water system of heating is by far the best which can be employed, and when the house is small, or even of the common size, no particular method of heating will surpass the conical boiler or some of its modifications either in economy in fuel, or the most easy and perfect system of regulating the apparatus, providing it is well constructed. Artificial heat, in the management of Cape Heaths, is only necessary to exclude frost, and should never be applied unless the thermometer sinks near the freezing point. Mr. M'Nab in his excellent Treatise says, that Heaths will sustain no injury in the house with the front lights open day and night, until the thermometer falls more than eight degrees below the freezing point. If the frost by any accident gets into the house, and if the thermometer is not likely to sink much lower after it is discovered, the best plan is not to raise the temperature by artificial heat, but, where it is practicable, to cover the house with mats and shade the plants from the morning sun. Experience has proved that if frozen plants be thawed gently, they will in most cases escape uninjured; whereas, had the temperature been suddenly raised, the worst effects would have been apparent. Many nurserymen, who grow these plants in large quantities for the market, keep them in low pits during the winter, covered over with dry straw or litter in severe frost, which answers their purpose extremely well.

A free circulation of fresh air at all times is of the greatest consequence, except when the thermometer is so low that it would be dangerous; and, therefore, both top and front sashes should be daily opened. When there is no danger from frost or high winds, the sashes should be left open all the night.

Some of the best growers do not approve of putting them out of doors amongst common greenhouse plants during the summer months if there is room for them in the house; when placed on ground, the pot gets filled with worms, the drainage choked up, and the plants continually blown about by high winds. Low pits are well adapted for the finer kinds in summer; when they can be fully exposed during fine weather, and the lights easily drawn over them when it is wet and stormy. The fine short-leaved kinds, such as E. aristata, are greatly benefited by such protection.—*R. F.*

ON THE CULTIVATION OF THE PETUNIA.

HAVING been very successful in the cultivation of this truly beautiful genus, and having raised one of the finest varieties ever yet sent out, viz.—Fielder's Magna rosea, I have sent you my simple method of treatment, if you should deem it worthy of a place in your columns.

Early in September, the cuttings should be put into 60-sized pots, and placed in the front of a hotbed until they have struck root, which will be in about three or four weeks; at which time they may be removed to a cold pit, or to the front of a greenhouse. Early in February they should be shifted into 48-sized in a mixture of sandy peat, leaf-mould, and loam, and repotted as fast as the pots become full of roots, using 1½ inch of small charcoal to act as drainage at the bottom of each pot. During the time they are growing in pots, they should be watered two or three times a week with manure-water; and the latter end of May they may be turned out into the flower-garden. The soil which there suits them best is a light rich loam mixed with well-decomposed dung. They form splendid objects when planted on the lawn, and trained to a wire or stake of any shape which may be agreeable. I have grown mixed plants of three or four different colours five feet in diameter, and the contrast has been strikingly beautiful.—*G. Fielder, gardener, Wadhurst Castle.*

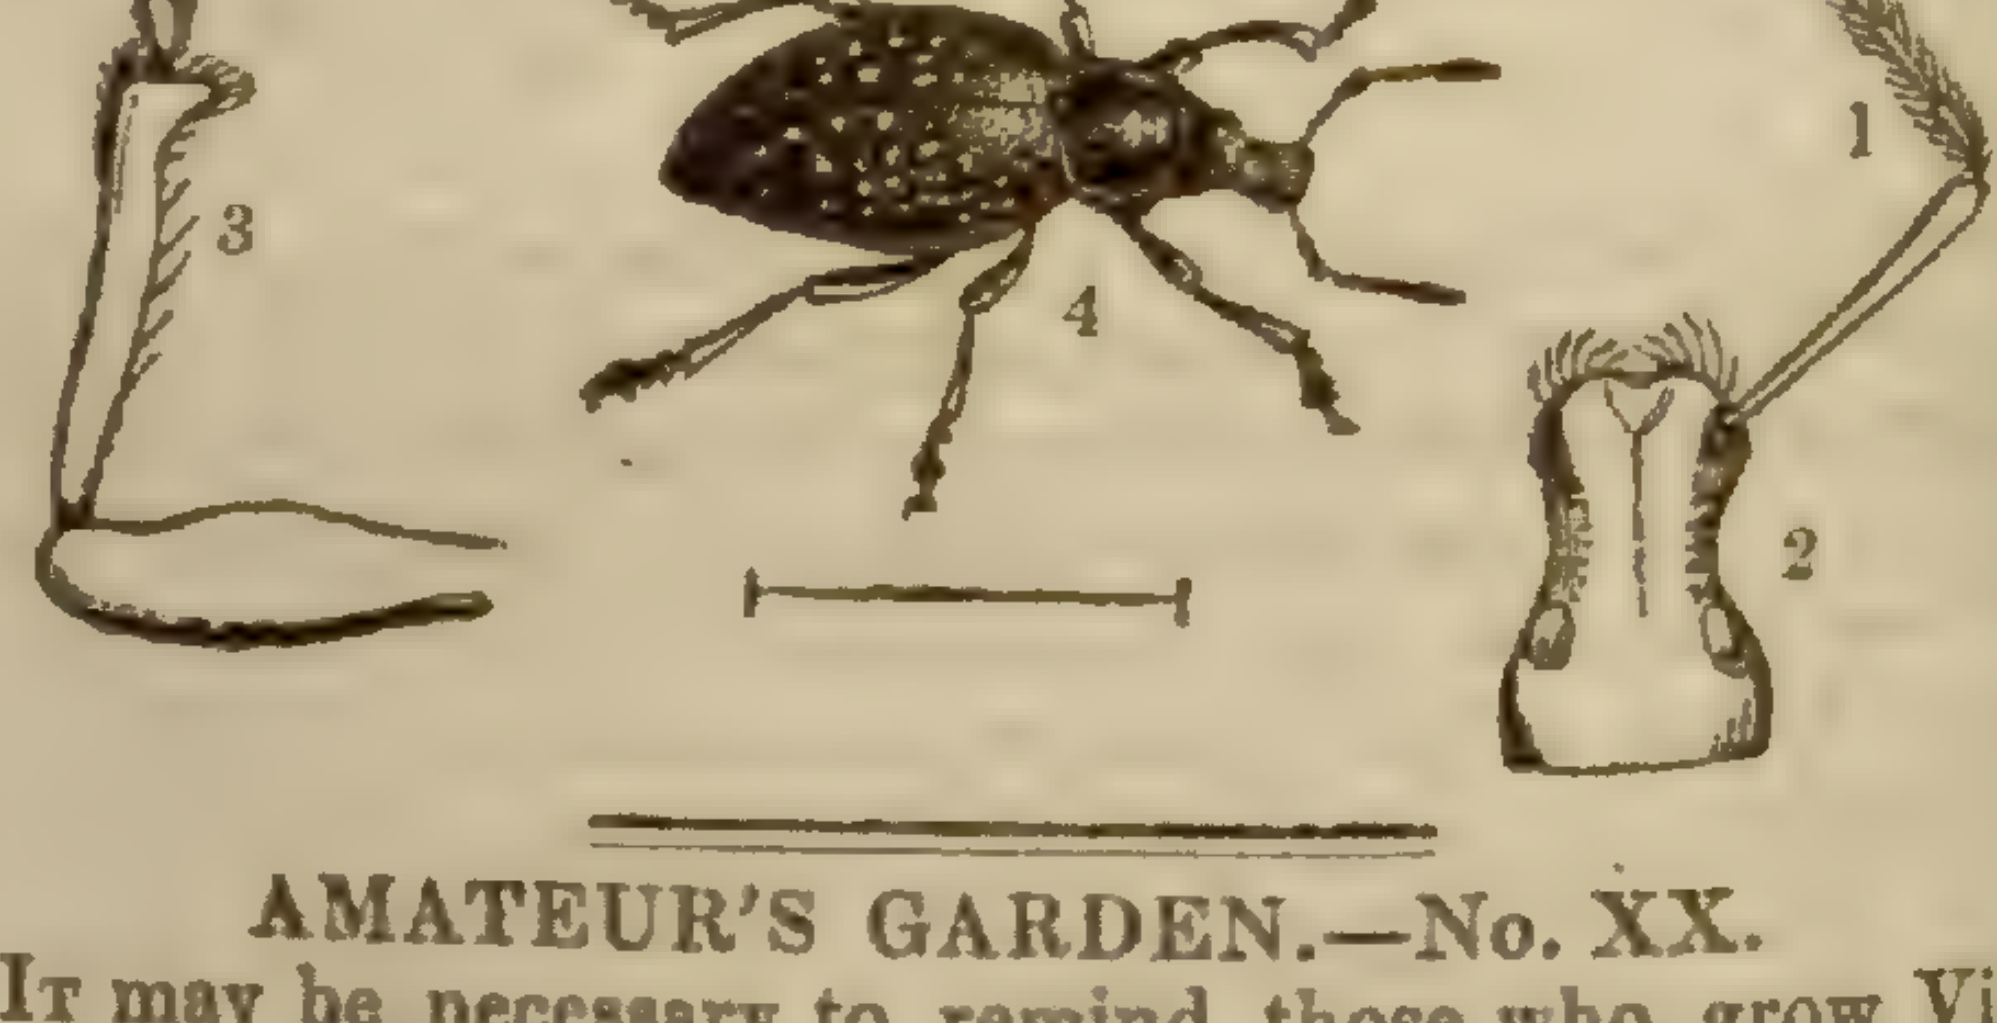
ENTOMOLOGY.—No. XXVIII.

OTIORHYNCHUS TENEBRICOSUS, the Red-legged Garden Weevil. In a former Number * we detailed the history of two species of Curculio which are very destructive to the Vine and fruit-trees; and a promise was then made to notice another allied species as soon as sufficient information was obtained; we have now much pleasure in returning to the subject. The O. tenebricosus is so nearly related to the two beetles alluded to, that their larvæ and pupæ probably could not be distinguished; † and from the communications of our correspondents, it is evident that their economy is pretty nearly the same. The maggots of the Red-legged Garden Weevil are found round the base of the stems of wall-fruit, sometimes in very great quantities, a few inches below the surface, where they undergo their transformations; the beetles, which are old offenders, come out only at night to feed upon the buds of wall-fruit, doing great mischief to Apricots, Peaches, Nectarines, Plums, &c.

Last spring all the Apricots and some Plum-trees in Somersetshire, which appeared to be at that time their head-quarters, were infested by myriads of these beetles; they first destroyed the fruit, and subsequently attacked the bark and leaves, so as not unfrequently to endanger the life of the trees; they commenced their depredations in April, by eating the unexpanded blossom-buds, clearing out the centre and leaving only the external bracteæ and occasionally fragments of the immature leaves; they will thus proceed along a branch until all the buds are destroyed, and afterwards demolish the young eyes which ought to produce wood-shoots, until nothing is left but the bare branches; sometimes a bud escapes at the extremity and eventually pushes into leaf. In one instance, from eight fine Apricot-trees which were in full blossom-bud and promised to do exceedingly well, only six Apricots could be found the middle of May on the whole of the trees, in consequence of the ravages of these Weevils. In Cambridgeshire, several hundred feet of wall were planted last winter with fruit-trees, and the buds and young shoots have been eaten off within the last week or two to a very considerable extent, the Peach and Nectarine trees having suffered most severely. On referring to "Curtis's British Entomology," * we find that this Weevil attacks a variety of plants before it arrives at its perfect state. It appears that five or six years since, multitudes of the O. tenebricosus were observed in the gardens of Lord Eldon, at Encombe, Dorset, where they were reported by the Rev. J. M. Colson to have destroyed the roots of every vegetable, as well as of the smaller fruits, such as Strawberries, Raspberries, Gooseberries, and Currants; but in this case it must have been the larvæ which did the mischief; so that these insects are great enemies to the gardener in two stages, for the maggots first attack the roots and the Weevils afterwards destroy the buds.

The beetles bury themselves by day in the earth, close to the foundation of the wall to which the trees are trained, likewise round the stems of the trees, and most probably in chinks of the bricks and other dark hiding-places. This insect belongs to the family Curculionidæ; it is distinguished in modern nomenclature under the generic name of Otiorhynchus, and is called by herbalists C. tenebricosus; it varies considerably in size and colour according to the age, for when recently hatched it is clothed with a delicate yellow pubescence, forming little irregular spots upon the elytra, but they soon wear off and disappear, when it becomes of a shining black, inclining to a pitch colour: the antennæ are long, thin, geniculated, and composed of twelve joints; the slender club comprising four rings, which are downy and rusty; the head and rostrum are thickly and minutely punctured; the latter is short, stout, and dilated at the apex, with three ridges down the back (fig. 2); the thorax is finely granulated, ovate and truncated, sometimes of a bright-chestnut colour; scutellum invisible; elytra soldered together, more or less finely scabrous, sometimes with distinct longitudinal punctured striæ, which are in other individuals obliterated, except at the apex, which is obtuse in the male and pointed in the female; wings none; legs generally bright-chestnut colour; thighs incrassated; shanks flexuose, the tips pectinated, dilated, and truncated; feet four-jointed, cushioned beneath, two basal joints obtrigonate, 1st the longest, 3rd bilobed, 4th slender and clavate; claws small, curved, and acute (3, the fore leg); male nearly 5, female 6 lines long (fig. 4).

The larvæ of these Otiorhynchi being as destructive as the perfect beetles, the main object ought to be to destroy the former if possible in the autumn, which probably would be most readily effected by stirring the earth all along the base of the wall and round the stems of the fruit-trees, and then sprinkling salt pretty thickly over the broken surface, or salt and water; or, perhaps, liquid manure might be equally beneficial, if not better, for it seems evident from the peculiar spots in which they generate, or rather undergo their transformations, that situations sheltered in a great measure from the wet are most congenial to their habits. The beetles can only be arrested by hand-picking with a candle and lantern, and afterwards pouring boiling water upon them, as their shells resist moderate heat. There is a sand wasp, called Cerceris læta,† which destroys innumerable quantities of these and similar Weevils, by carrying them into their burrows for their larvæ to feed upon, and thus assist in keeping these insects under, which are occasionally so troublesome in our hothouses and gardens.—*Ruricola.*



AMATEUR'S GARDEN.—No. XX.

IT may be necessary to remind those who grow Vines upon the rafters of the greenhouse, that much of the success depends upon careful summer pruning. Supposing that they have been pruned upon the spur system (which is the best for them under these circumstances), and that they have been established for some time, and are clothed with young bearing wood from the bottom to the top; the point of each shoot ought to be pinched off beyond the second or third joint above the fruit. Any laterals which are sent out afterwards ought to be "stopped" beyond the first eye, and not allowed to scramble about, to the injury of the other parts of the Vine. The thinning of the berries is another important operation which must be carefully attended to. It is a common thing, even in extensive gardens, to see the berries unthinned until the whole have become crowded and nearly grown together, and at this stage it is impossible to thin them well. Much of the strength of the Vine is thus lost—unless the thinnings are intended for use—and many of the berries left are necessarily injured with the point of the scissors, and afterwards crack and become unsightly. The berries should always be thinned as soon as they are fairly set, and before they get as large as the smallest Pea. Vines out of doors upon walls are now progressing rapidly, and will soon require to be gone over and examined. Their treatment with regard to "stopping" ought to be the same as has been already pointed out. The leading shoots may be left considerably longer than the others; and the main object, both now and in the winter pruning, ought to be, to get the wall regularly covered from the bottom to the top with fruit-bearing wood. Nail or tie them in properly, to prevent their being blown about and broken by high winds.

---

* Gard. Chron., No, 19, p. 292.

† Ibid. figs, 3 and 4.

* Fol. 690.

† Curt. Brit. Ent., fol. and pl. 269.

In the climate of London, and in other parts of the country where vegetation is so far advanced, those who have Peach-trees will require to look over them. In many cases it will be found that the fruit has set too thickly, and it will therefore be necessary to thin it, taking care to leave the best, and only one at an eye; and at the same time, if possible, leaving the crop regularly over the surface of the tree. When the shoots get crowded, it will be of great service to thin them out; but this should be done cautiously and by degrees, otherwise the tree will receive a check which will be very detrimental to its health. Remove first of all the front shoots, or those which grow at right angles with the wall, taking care to leave uninjured the one which grows nearest the base of last year's wood, and the other which grows from the top. Between these there are generally several, which, if they have fruit at their base, ought to be shortened; but if barren, may be removed, unless they are wanted to furnish the tree with wood. When the summer is farther advanced, the two shoots which were allowed to grow may be stopped, and every means taken to encourage the lowest one (in particular) to ripen well before it loses its leaves; this is necessary, because upon it depends the crop of the following year. This system of course applies to the common English fan-training.

The warm showers which have fallen lately have been very favourable for planting out half-hardy things in the beds and borders, and no time therefore should be lost in getting out the more hardy amongst them. Leave Pelargoniums, Heliotropes, and Dahlias to the last, as they are very easily injured by slight frosts. As this Paper circulates very widely, the readers in the various localities are the best judges of the time when such plants may be exposed with safety.—*R. F.*

HOME CORRESPONDENCE.

French and English Propagators.—The observations of your Parisian correspondent in a former Number, relative to the comparative ability of French and English propagators, which have led to a reply in a late *Chronicle*, induce me to offer a few remarks on the conclusions at which each writer has arrived. Having for some time been acquainted with some of the most eminent propagators of the present day, more especially with those in the neighbourhood of London, and having in the course of my professional duties had frequent opportunities of estimating their comparative qualifications, I cannot refrain from thinking that your correspondents might have come much nearer to the point had each been personally acquainted with the merits of those whose superior claims they have advocated. I say personally, for your correspondent of the 30th inst. appears to be ignorant of the fact, that of the three instances he has cited in the propagating departments at Low's, Rollisson's, and Knight's, the two latter are under the management of Continental propagators (the one a Pole and the other a Frenchman). But concerning facts which are incontrovertible, it is needless to deny or assume the superiority of either; especially if it be proved that each is in possession of abilities which are alike essential to professional pre-eminence. Those who are intimately conversant with the principles of propagation at the Metropolitan nurseries, must have often observed with interest the general, and also the particular modes employed at the last-named nurseries, in the increase of those plants in which their respective propagators are known to excel; and no doubt an equal interest has been often excited in comparing the successful operations now adverted to, with the striking contrast attending the propagating departments at Mr. Henderson's, Pine Apple-place; Mr. Low's, of Clapton; and Mr. Pamplin's, of Hornsey. A diligent inquiry will easily convince the most sceptical that the success attending the practical efforts of our most eminent men will justify me in classing the general modes of propagation under two divisions, viz.—propagation by cuttings, and propagation by grafting, inarching, &c. Without attempting to assume what I think is impracticable—a pre-eminence in either case—I respectfully offer an opinion that the Continental propagators are equally in advance of my own countrymen in the practice of the second division, as English propagators are *vice-versâ* by their unparalleled success in the first. The result of my own experience does not furnish me with a single instance of eminent skill in both. Repeated observation has convinced me that Continental propagators have discovered many important improvements in consequence of scientific investigation having been connected with practical experiment. If in some instances the propagator by cuttings has accomplished an important end by securing an ample supply of some favourite plant, the propagator by grafts, &c., has also conferred a benefit upon his profession by attaining an earlier and stronger development of constitutional vigour, by a mutual union of distinct species, and often, by an accumulative energy, given birth to the latent forms of beauty and perfection.—*William Wood.* [We think this letter leaves the matter exactly where the writer found it. Will he pretend to say that any such grafting as is practised in Germany and France would be tolerated in England? If such things as are called budded and grafted plants, and sent here as such from the Continent, were prepared in an English nursery, there can be little doubt that the services of such propagators would be quickly dispensed with.]

Caprification of Figs.—In reference to a paragraph in the last Number of the *Gardeners' Chronicle* upon "Neapolitan Peaches of an unusual size," I would take the liberty of putting the question whether they had not been subjected to a treatment similar to the "Caprification of Figs," so commonly practised upon the Continent. Upon the chance (not indeed a very probable one) of your being unacquainted with it, I may as well add that this consists in piercing the crown of the fruit, when it has acquired about two-thirds of its natural size, with a large needle, and inserting into the puncture a drop of olive oil. This, I suppose, puts a stop to the process of fecundation; and the results are, a very early arrival at maturity, an unusually large size, and a more than commonly luscious flavour.—*An obliged Reader of the Chronicle.*

Strawberries grown in a Pit.—Finding myself short of Strawberry plants in pots for forcing, I pursued the following plan, which has succeeded admirably. In the beginning of March I took up carefully some plants of Keen's seedling, eighteen months old, from the open ground, and put them in a three-light melon-pit, in good rich soil, planting them as close together as possible, with a bottom heat (from Jan.) of about 80 degrees, and keeping them shut up until they began to grow, at which time I gave them a little air daily. As soon as they showed flower, I removed all the weakest crowns; and when they began to bloom, I drew off the lights for four or five hours during every fine day, until they had set their fruit, which they did most abundantly. These will be ripe in about a week; and I never saw so large a number of Strawberries on the same space, either in or out of doors. If your correspondent "W. W." means to put young plants for forcing in his pit now, a great deal of time will be lost, as by the above method he may have his fruit ripe in little more than two months after planting. Another advantage I possessed in having my plants matured before I put them in; and they were not allowed to occupy more than a third of the space which they did out of doors. No doubt the late fine weather favoured the setting of the fruit; but with hot-water pipes a dry atmosphere could be obtained at any time. My plants were put in close to the glass, and the tan gradually sunk about a foot, thus allowing room for their growth.—*M. Henderson, Coleorton Hall Gardens.*

Grapes.—With reference to the observations by Mr. Fish at p. 286, I beg to make the following remarks. I question much whether, if I had only half the crop on my Frontignan Vine, the disease would have been obviated, since the cause still remains, viz., the deep immersion of the roots; and the partial cure I have tried, namely, to get fresh fibres from the stem, is too recent to effect much change. The Vine is, however, showing plenty of fruit again (one sign of not being overburdened); and I dare say I shall let most of it hang, since it *shanks* very little, and only shrivels, a defect (some do not think it so) to which Frontignan Grapes are particularly liable (see *Chronicle*, page 2[illegible]8). As to the period chosen for my operation, I do not think a more eligible time could have been taken. Every gardener knows that, at that stage of a Vine's progress, it has a disposition to throw out rootlets, and the fresh fermentation of new soil would assist them greatly.—*No Conjuror.*—[This is the substance of our correspondent's letter, of which we have omitted the greater part. We will not allow our columns to be converted into a field for altercation; and we must request those who favour us with letters to understand that discussion is very different from disputing.]

Bleeding of Vines.—We have no fewer than six correspondents who complain that the receipt given by Major Moor, at p. 286, for stopping the bleeding of Vines, should have been the same as one to be found in the Horticultural Transactions, vol. i. p. 102, from the pen of the late Mr. Knight. We must plead guilty to having forgotten that it is to be found there; and we undertake to say that our gallant correspondent was equally unconscious of its being in print. We rejoice to find there is such good authority for the efficacy of this substance.

Varieties in Trees.—It is only by watching the habits of particular plants that varieties are obtained and perpetuated. I have an Oak which invariably comes into leaf nearly three weeks before other Oaks; it is, however, of the common kind; for some days it has been in full leaf. There are two Oaks beside it which do not show a tinge of green. As there is no great object in obtaining an early variety of common Oak, it may not be worth while to graft from this: but the notice of the fact is valuable if it should stimulate attention to the occurrence of particular qualities in any one specimen, so as to enable persons to propagate from it.—*Totty.*

Quality of Timber.—The rapid growth of timber, and especially the Oak, has been adverted to by you with great effect, and evidence has been adduced to prove that rapid-grown Timber is the best for naval purposes. I think it would have been of importance if the age of the different trees whose qualities have been ascertained in her Majesty's dock-yards had been given, because some of your readers may perhaps infer from your statements that a fine vigorous-growing Oak-tree, of 30 years' growth, is as valuable for its timber, if cut down, as a stunted one at 50, which may show the symptoms of old age. This, however, is by no means the case, for though the bulk may be the same, the quality of the fast-grown timber is much inferior; it is therefore only where Oak-trees arrive at a good mature age, and are fit to form plank for naval purposes, that the rapid-grown timber becomes the most durable. If the primary object of a planter be profitable timber, I should not recommend him to plant more Oaks than can be left to grow for naval purposes, except the soil be peculiarly suitable, as the tree is not valuable for timber when young, and not so suitable for general purposes on an estate as many other kinds are. Much of course depends on soil and locality for the profitable production of timber; but where the Larch, Ash, and Spanish Chestnut will grow well, they will be found of greater bulk and durability in youth than even the king of the forest, and (with the exception of the Larch) will make an excellent coppice.—*J. A. F.*

Araucaria imbricata.—I have a specimen of this which was planted in the open air in May 1838—it being at that time three feet high, and of a good colour; since then it has been gradually becoming paler, till now the leaves, and especially the young shoots, are blanched like Celery. Otherwise it appears healthy enough, having grown 14 inches since it was put out, besides making excellent roots. It was planted in a pit three feet deep, filled with vegetable mould, the bottom of which was lined with round stones, besides being close to a drain, so that no water can lodge at the roots. In winter it is protected with matting, and opened to the air every tolerable day. Could you or any of your correspondents give a reason or suggest a remedy for this strange deficiency of colour through the medium of the *Gardeners' Chronicle*, you would confer a great favour upon *North-East.* [We are unable to explain this circumstance; perhaps some of our correspondents can.]

Broccoli.—I cultivate here two sorts of Broccoli, which are well worthy of being added to Mr. Gordon's list. They are the Walcheren, and White Danish. The former is equal in size, appearance, and quality, to the best Cauliflower, with the advantage of being much hardier. By sowing at different times in spring, and again in autumn, it may be had in perfection from June to Christmas. Those sown in autumn will generally require protection, or the shelter of a warm border during winter; though I have had them stand out equally well with Knight's protecting, and fit for use in April. The White Danish is valuable for its good quality, hardiness, and dwarf habit, and is in use at the present time, having been sown in the middle of May last. Its stalk is only a few inches in height, and the leaves do not exceed a foot. The heads, which are shielded by the leaves, are of medium size, compact, and beautifully white.—*W. Elliott.*

Cockroaches.—Sympathising very warmly in the household discomfort of your correspondent "Q. in a Corner," and having mastered the nuisance of which he complains, I beg to offer him my advice as an improvement upon that you have already given. I find, on reference to p. 262 of the *Chronicle* of last year, that you recommend the water-traps of our friend *A. A.* I can most confidently assure Mr. Q. that he will find that Cockroaches (like some other animals) have been "sworn at Highgate," and that they very much prefer sugared beer to plain water. They will drink the latter, it is true, when nothing better is to be got at; and I have had occasion to observe them accidentally drowning themselves in the water-cistern, of which I shall speak presently, and congregating also about the leakage of the boiler-tap;-but sweets are their great delight, and when my house was infested with them, nothing was so obnoxious to their visitations as the sugar and preserve pots. For the last three years our practice has been this:—We take two quarts of table-beer and half-a-pound of brown sugar, and simmer them together, and distribute this liquor (a little warm) in three common glazed brown-ware deep pie-dishes, one of which is placed on the kitchen-hob, one in the coalhole close by, and one under the grate, close to or in the cinders, when the fire is put out. Coarse cloths are wrapped round the dishes to facilitate their ascent, and in the morning they are removed, and the liquor passed through a sieve to strain off the dead insects. In this way the same fluid may be used for a week together, warming it afresh every evening. It may be convenient to sink a basin in the floor, as recommended by *A A.*, but this is not necessary, as the insects find ready access to the fluids in the way above described. Whatever part of the house they may wander to in the course of the summer, these insects are sure to return to the kitchen in winter, or to some equally warm quarters, where food is to be got; and we now find it necessary to practise the traps for two or three months only in the spring, when they begin to be lively and to breed. It is probable that the few stragglers left which make their appearance again in the kitchen in winter, are those which have emigrated to the upper rooms before the annual catch has been established. When on the subject of my Cockroach warfare last year, *A. A.* was pleased to be facetious on my recommendation to keep all parts about the kitchen-grate cool. Notwithstanding this raillery, it is a point of great importance, and curiously illustrative of the history of this domestic pest. I would recommend Q. to do what I have done—open a hole in the back of his chimney, and let in a draft of cold air to all parts adjacent where it can be admitted. I availed myself of the passage of a water-pipe from a cistern behind, with a ball-cock for keeping the grate-boiler supplied, by enlarging the opening; and it had a sensible effect in checking the growth of the evil. A high degree of warmth is necessary to the existence of these beetles; and last year, being a cold summer, I did not see one in my Melon-pit or in my Grapery; although they have been frequently found there in warmer seasons.—*P. P.*——*Q. in a Corner* and all persons infested with the loathsome Cockroach will do well to try quicklime dusted over and into all the holes, corners, nooks, and crannies by which they make their exits, and I venture to promise that their future entrances will be most agreeably postponed—at least, you soon see no more of them.—*C. H. H.*——Your correspondent "Q. in a Corner" will effectually destroy any quantity of black beetles or cockroaches he may be troubled with by purchasing a packet of "Wiltshire composition for destroying rats and mice," with which he will get printed instructions; the best amongst them is mixing the composition with fresh butter or lard, and forming a lead-coloured paste, which is to be spread on bread. I used this to destroy rats in the first instance, and found it to kill cockroaches by thousands. It is poisonous; and if rats are in the same place as the cockroaches, it will be necessary to put something about the weight of a brick on the crust of the bread; as I have found that rats will carry it a great distance. The composition can be purchased of most druggists and vendors of medicines. Many of my friends have also tried the same remedy, and find it quite effectual.—*Penny.*——I exterminate all vermin from my stables, coach-house, wash-house, and all other out-door offices, bricked and paved, by coating the sand on which the bricks and stones are laid, with a wash of gas-tar and water. I call it a wash, but it is more of a plaster, when mixed, as it ought to be, with the sand, the proportions being about 1 of gas-tar to 2 of water. If your correspondent would have the flooring of the infested apartments taken up, and this lotion applied, stopping up all holes with tow soaked in the same, and washing all the under-pinnings, of whatever kind, with it, he would, I think, be rid of his plague. No doubt they are in the ground-floor of his house, and if once dislodged from their quarters there, they will soon disappear. If not, set me down for an ignoramus.—*H. B., Essex.* [Who is to endure the stench of all this in their dwelling-houses?]——I have known several instances in which, where Black Beetles have prevailed to an alarming extent, they have been destroyed by scattering about a large quantity of refuse wafers; which can be obtained cheap at any wafer-manufactory. Your correspondent, "Q. in a Corner," mentions having used "vermilion wafers:" they ought to have answered the purpose; but perhaps a sufficient quantity was not used.—*X. Y. Z.*

Mice.—As many of your correspondents will be troubled with these pests, both in-doors and out, the following instructions may perhaps be useful, and obviate the necessity of keeping cats, which are nuisances alike in the house and garden:—Procure six mousetraps, of that kind which are set by tying down a wire spring with thread, and made with from four to six holes in each; they are to be purchased at most shops where such articles are kept. Dry some coarse oatmeal in a frying-pan, but not so as to make it brown, with which fill each hole one-quarter full. Mice prefer oatmeal to any other food; and when they bite off the thread, the wire spring flies up, and they are caught. Fresh oatmeal must be applied every other day, and the traps should be kept regularly set. About six for the house, and six for the garden, will, I am able to prove, catch more mice than half-a-dozen cats.—*Penny.*

Vipers.—As you admit some observations on the habits of animals relating to gardens, perhaps you will insert the following question. I have a sunny bank and hedge bounding my garden; in this a viper has been seen. There was a tradition that vipers did inhabit the bank, but till this year none have been seen. Its presence has caused great dismay. Can any of your subscribers inform me of any means of catching vipers? I have in vain had a watch set, and moreover offered a reward of half-a-crown for the capture.—*Totty.*

Salvia patens.—Permit me to add my testimony also to the fact of the Salvia patens surviving the winter in open ground, and in stiff, cold, clayey soil, covered only with about half-a-peck of cinder-dust. The aspect is S.W., where it was exposed to all the soaking and driving autumnal rains from that quarter. Seven other sorts of Salvia, in the same aspect (but most of them in a much lighter and drier soil), to my great grief, have perished.—*H. B., Essex.*

Gas-Tar for Gravel-Walks.—Let me advise some of your readers (who may be some of them busy just now in making gravel-walks), that if they would keep them free from worms, they may enjoy that privilege by coating their first bottom layer of material (supposing it to be of either stone or rubbish from 6 to 12 inches deep) with a wash of gas-tar and water, in the proportion of half-a-gallon of the tar to a large water-pot of water. It is to be applied with the rose on the pot, and kept stirred well. After putting another layer of rubbish or drift, or a coat of coarse gravel about two inches thick, apply another lotion of gas-tar water, which need not be quite so strong as in the former application. This treatment I have given my own gravel-walks, which have neither weeds nor worm-casts, and I have done nothing else to guard against them but what I am now recommending.—*H. B., Essex.*

FOREIGN CORRESPONDENCE.

Paris, April 1842.—The first exhibition of the Paris Horticultural Society for the present year was held in the Saloons of the Luxembourg Palace on the 14th, 15th, and 16th of this month; and although the exhibitors were numerous and the visitors considerable, yet, taken as a whole, the show was neither remarkable for new plants nor fine productions. The time was ill chosen; the finest Camellias and forced flowers were past, and Roses, Geraniums, and other ornaments of spring, but yet in embryo. Moreover, many who could assist in rendering these exhibitions attractive have no confidence in the impartiality or knowledge of the judges chosen by the Society, and therefore do not choose to put themselves to trouble or expense in preparing for them; it being, alas! but too notorious that the best plants do not always obtain their reward. The Abbé Berlèse exhibited (not for a prize) a large and, considering the lateness of the season, fine collection of Camellias—Triumphans, Lactea, Duchesse d'Orléans, Imbricata alba, Heteropetala, Reticulata, Elegans, and Grand Frédéric, were in splendid colour. Those of M. Paillet were also fine, especially Donckelaerii, Futtang, Elegans, and Leeana superba; he had also some good specimens of Rhododendrons, among which I noticed Duchesse de Wurtemburg, Excelsum, Russellianum, and Superbum: but infinitely the finest collection in this class was that of M. Modeste Guérin; and yet the prize was awarded to another for plants comparatively worthless. Among the Rhododendrons of M. Modeste were Atrosanguineum, Altaclerense speciosum, Consinum superbum, Duchesse de Wurtemburg, Formosissimum, Russellianum, Smithii, Caucasicum album, Punctatum roseum, and Rubescens flore-pleno, with magnificent trusses of blooms. MM. Roblin and Berger had some good forced Roses; the most striking were Comte de Paris, Lady Fordwich, Lamarque, Princesse Hélène, Bougère, Smithii, and Laffay's new varieties—Duc d'Aumale, Perpétuelle Rivers, Prince Albert, and Mrs. Elliot. M. Tripet Leblanc had some large and well-grown Hyacinths which attracted much notice, and some very middling Auriculas and Pansies which would have been better out of sight: his Daubentonia Tripetiana was not there. M. Uterhart exhibited Rhododendron altaclerense, Triumphans, Fulgens, Russellianum, and Augustum—the first a fine large plant, the others common-place; also Ericas, Epacris, Polygala grandiflora and cordata, Chorizema varium and Dicksonii, Boronia serrulata and crenulata, Kennedya coccinea and glabrata (not in flower), Æschynanthus ramosissimus and grandiflorus, Andromeda floribunda, two or three ancient Cinerarias, and a few Camellias, for which the judges gave him two medals, one as the best collection, the other for the newest plants. This award has given general dissatisfaction, the injustice being too glaring to escape notice from the merest tyro in horticulture. M. Martine's collection comprised some very good Ericas and Epacrises, also Mimosa prostrata, Columnea Lindenii, and Limodorum Tankervilliæ. M. Chauvière also had a well-grown plant of Columnea Lindenii, Pultenæa capitata, Pimelea spectabilis, Æschynanthus ramosissimus, Gloxinia hybrida and maxima, Cineraria grandis and formosa. A very fine specimen of Clianthus puniceus was in the stand of M. Nivet. Messrs. Cels had a large collection of Cacti, some few very fine and large, also Rhododendron excelsum, Augustum, and Duchesse de Wurtemberg; Camellias—Duchesse d'Orléans, Press' Eclipse, Leeana, Reticulata, Triumphans, and Punctata major; a few Orchidaceæ, together with Proteas, Boronias, Begonias, Corræas, and other plants, in sufficient numbers to fill a small greenhouse—indeed, far more numerous than select or good. The best collection of fruit was from M. Jamin, who had some beautiful specimens of Pears, especially Van Mons Léon Leclerc, Triomphe de Louvain, Bon Chrétien d'Hiver, Doyenné Gris d'Hiver; Beurré Gris d'Hiver, de Flandre, and d'Angleterre; Bergamotte de Pentecôte and De Soulers, Doyenné d'Hiver, Besi Sans-pareil, Catillac, Bellissime d'Hiver, and Orange d'Hiver. M. Souchet had a small but fine collection; his Apples, Reinette du Canada, and Calville Blanc, and Pears, Belle Angevine and Bon Chrétien d'Hiver, were magnificent. There were but few forced fruits or vegetables, and even these were miserable in the extreme; a few pots of Keen's Seedling and Alpine Strawberries, one or two Melons but little larger than a good-sized Reinette du Canada Apple, Cucumbers six or eight inches long (certainly not grown after either Mills or Weedon's plan), two or three bundles of Carrots, some White Cos Lettuce, and a few Cauliflowers, comprised almost all that was to be seen in this department. Such was the opening show of 1842, adding nothing to the reputation of the Society, affording but little satisfaction to the exhibitors, and to the public at large so flat and uninteresting, that even the Paris papers could not help noticing its poverty. [Our readers will perceive that the two correspondents who have sent us an account of this exhibition have taken very different views of the quality of the objects exhibited, and of the manner in which it was conducted.]

Bermuda.—The progress of agriculture in this island has latterly been very great, and Col. Reid has been engaged in introducing various new trees and plants; having, after much labour, got sufficient ground cleared for that purpose. If the work begun by his Excellency be followed up by his successors, the Government House Garden will rank amongst the most beautiful anywhere. It is formed by a ravine between two hills, with a flat at the bottom, which was formerly a peat bog, but is now a fine meadow. Walks and terraces are being formed, and about two miles of these are already finished. The steep slopes of the hill are being ploughed horizontally with oxen. The engagement of Mr. Fox (the agriculturist sent out by the Colonial Office) having expired, he is on his return to England. His place is about to be filled by Mr. M'Gall, who intends marrying the nursery governess in Col. Reid's family. We are assured there is more cultivation now in Bermuda than at any time in the memory of the present inhabitants; although the valleys were once before cultivated, previously to the settlements in Virginia extending themselves.—*April* 10.

Fernando Po.—This island produces the rankest vegetation that the mind can well imagine, being covered from the foot to the top of the central mountain with productions which would repay the labour of an enthusiastic Botanical collector to investigate. A quantity of fine timber is annually brought from thence to this country (England) by the West African Society. It is to be regretted that the cultivation of Cotton, Coffee, Indigo, and other tropical productions is not carried into effect, as there is every gradation of soil and situation. There is a garden of some extent attached to the house of the Governor, but at this time totally neglected. Several fruits and plants have been introduced to this settlement; among which are the following: Sweet and Sour Sop (Anona squamosa and muricata), Anona Cherimoyer, Papaya Carica, Papayas, Oranges, Limes, Lemons, and Guavas; also Bananas, Plantains, Cocoa-nuts, Cinnamon, Camphor, Cocoa, or Theobroma Cacao. There are also a few plants of the African Coffee from Prince's Island; Pine-Apples are plentiful, but being much neglected, they produce but small fruit. The Castor Oil plant (Ricinus communis) is found about the settlement at Clarence Cove, and is used by the natives as a purgative. Two species of Cassia are also found growing here, but they are not applied to any purpose by the inhabitants. Upon the arrival of a stranger at this port, he cannot fail of having his attention arrested by the fine fence formed of Yuccas planted by the side of the road leading from the beach to the Governor's house. The plants have thrown up suckers from the roots till they have become uncommonly thick, and present their sharp points, rendering it impervious to man or beast.—*J. A.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

May 12.—Mr. Solly's third Lecture was delivered to-day. He commenced by an account of the nature and properties of nitrogen, showing that it exists in the air, of which it constitutes about four-fifths; and that, being possessed of properties in all respects the reverse of oxygen, and distinguished by the absence of any marked characters, it appeared that its principal office is to dilute the oxygen of the air, and diminish the too powerful effects which it would produce in an undiluted state. In the air, however, oxygen and nitrogen are only mixed; when combined they form nitric acid; and, on the other hand, when nitrogen and hydrogen are combined, they form ammonia: thus affording two excellent illustrations of the curious results of chemical combination, and the very great difference existing between compounds and their elements. Having thus described the four great elements of Plants, their properties, and compounds, attention was drawn to the proximate elements of Plants, or those compounds of oxygen, hydrogen, nitrogen, and carbon, in different proportions, which, as woody fibre, gum, sugar, starch, gluten, &c., constitute vegetable matter; the properties, nature, and different forms of these substances was described, and the curious metamorphoses which they undergo, and the transformations which they suffer, when acted on by acids and alkalies, was explained. Mr. Solly concluded by saying that, having now gone through the introductory part of the subject, he should next take up the great question of the food of plants, which would occupy the next lecture.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

May 4.—H. Handley, Esq., President, in the chair; 15 gentlemen were elected members. Col. Challoner, chairman of the finance committee, presented the monthly report of the accounts to the 30th of April, and gave notice that he should move at the next monthly council that a temporary collector should be employed to get in the subscriptions of members residing in London. Mr. R. Barker, vice-chairman of the house-committee, presented their report and the plans submitted by Mr. Dean for the society's house. The committee was directed to hold its next meeting on Saturday, and report on this subject to the ensuing council. The council proceeded to the consideration of the town in the north-eastern district, at which the annual country meeting should be held in 1843; and documents were submitted to their consideration in favour of Leicester, Derby, and Nottingham. Having deliberated on the advantages possessed, in point of locality and accommodation, by each town, and decided that either Leicester or Derby should be selected for the meeting, the Hon. H. W. Wilson for Leicester, and C. R. Colvile, Esq., M.P., and E. S. Chandos Pole, Esq., for Derby, requested leave for a week's postponement of their decision, in order that time might be allowed for procuring further information to enable them to decide this question. It was resolved that the final consideration should take place on the 11th of May.—W. Taylor, Esq., F.L.S., presented a bundle of Bokhara Clover (recently cut), with a coloured engraving and the following account of its cultivation:—"A small packet of the seed of this Clover, which appears to be a variety of Melilotus arborea, was given me by Mr. Loudon in the spring of 1839. It vegetated freely, and grew luxuriantly up to the latter part of September, when it was four feet high; it was then mown, and the stalks were manufactured into durable hemp. Horses eat the plant with avidity in its young state; and to judge from its extraordinary growth the first year, it may be fed off three times, namely, the middle of June, July, and August. It stood the winter of 1839-40 well, proving itself to be a hardy plant. On the 28th of April, 1840, a small portion of it was cut, then 15 inches high; on the 28th of May again, height 16 inches; and subsequently on the 28th of June, height 17 inches; in August 15 inches, and in September 12 inches; the first flowers appeared in June, and by the middle of July it was covered with fragrant white blossoms. A large portion had been left for seed, and towards the end of September the crop was harvested, each plant producing from 10 to 20,000 seeds, the stalks being from 12 to 13 feet in height. From the experiments I have made with Bokhara Clover, I should calculate that an acre would produce from 20 to 30 tons of green herbage. The first year it may be cut in June, July, and August, each cutting averaging three to five tons of green herbage; the second year, in April, May, June, July, August, and September, each month producing three to five tons of herbage. If intended to be saved for seed, it must not be cut more than three times, in April, May, and June. The roots form a sort of manure, and from two to three tons of hemp. Great advantage must be derived from its cultivation, as it forms a valuable green food for all sorts of cattle at an early period of the season; and if cut when 15 or 20 inches high, an abundant crop would be produced, yielding hay superior in quality and quantity to the common herbage plants. To judge from what has hitherto been seen of the Bokhara Clover, it appears to be a valuable biennial plant, well adapted for growth in this country; nor is it unlikely that it may thrive on such soils as are termed clover-sick; whereby its value would be greatly enhanced. Should it, as may reasonably be expected, in ordinary seasons, on good soils, be ready for cutting in the early part of April, farmers who have no Grass, and but a short supply of Hay, Carrots, or Turnips, would derive essential benefit from it. The Bokhara Clover being a tall, deep-rotted plant, with a strong stem well clothed with foliage and blossom, it keeps the ground in a more perfect state than most other plants of the artificial Grass kind, and, consequently, will be more influential in ameliorating and preparing soils for the reception of Wheat crops. It is a plant capable of being cultivated with advantage on almost all heavy and dry descriptions of land, if in a tolerable state of fertility; and it may be sown from March till June. The proportion of seed that is necessary must vary according to the quality of the land and the state of preparation to which it has been brought: on the richer descriptions of soil that are free from weeds, 8 to 10lbs. may be sufficient for an acre; whereas 14 to 15lbs. will not be too much for those that are of stiff quality, or which possess a less degree of fertility. As already indicated, the crop may either be mown for Hay, cut every month as green herbage for different sorts of live stock, or serve for the grazing of cattle and sheep. The separation of the seed from the capsule does not require so much labour and expense as the common Clovers. It is thrashed in the same manner as Trefoil, and sent to the mill to free the seed from the husk. The Bokhara Clover is likely to answer well, and may, in a great measure, render this country independent of foreign Clover-seed. On account of its elegant appearance, and the fragrance of its blossom, it likewise deserves a place in every flower-garden." Mr. Gibbs stated that the plant now known as the "Bokhara Clover" was identical with the Trifolium Melilotus alba, or (as it had been formerly called) the Melilotus officinalis alba, a plant which had been partially cultivated in this country for the last twenty five years, and the seed regularly imported by Messrs. Thomas Gibbs and Co., who had been in the habit of recommending the growth of a small breadth of this Clover, for mixing with Hay that might have been damaged by wet weather, the fragrance of the leaf imparting to it the smell of new Hay; also for cutting and placing in layers with Oat straw, for the purpose of cutting into chaff, stacks being formed of alternate layers of the straw and clover. Mr. Gibbs stated that this Clover grew to a gigantic height, but should be cut at an early stage, as otherwise it would be ligneous or woody in stalk, the soil most favourable to its cultivation being a deep rich mould. [It is, in fact, the Melilotus leucantha, as we have formerly stated.]

COUNTRY SHOWS.

Horticultural Society of St. Andrew's, Fifeshire, April 27.—The first meeting for this season took place in the Town-hall. The following were the successful competitors:—Best 6 Auriculas, 4 Self do., 6 Greenhouse Plants, 3 Hardy Shrubby Plants, 3 Double Hyacinths, 3 Single do., 3 Phloxes, 6 Heartseases, 2 Calceolarias, 12 forced Potatoes; 2nd best Shrubby Plant, 6 Geraniums, 2 Cinerarias, 6 stalks of Rhubarb: Mr. W. Connacher. Best Shrubby Plant, 1 Bulbous Plant, 3 Single Wallflowers, 6 Geraniums, pot of Mignonette, 2 Cinerarias, 6 stalks of Rhubarb, 4 Scotch Leeks; 2nd best 6 Auriculas, 4 Polyanthuses, 3 Shrubby Plants: Mr. W. Smith. Best 4 Polyanthuses, 4 Single Anemones, 3 Double Wallflowers, 2 Petunias, pot of Strawberries; 2nd best 3 heads of Sea-kale: Mr. A. Scott. Best 2 heads of Broccoli, 3 heads of Sea-kale, 20 stalks of Asparagus; 2nd best 4 Single Anemones, 3 Double Wallflowers, 2 Petunias, 6 Onions of 1841: Mr. J. Goodall. Best 4 Double Anemones, 4 Double Primroses, 6 Hardy Spring Flowers, 6 Onions of 1841, 2 Early Cabbages, 1 Swedish Turnip; 2nd best 6 Heartseases, 2 heads of Broccoli, 20 stalks of Asparagus, 12 forced Potatoes: Mr. J. Easson. The 2nd best 4 Double Primroses, 6 Hardy Spring Flowers, 4 Scotch Leeks: Mr. T. Erskine. The 2nd best 2 Early Cabbages, 1 Swedish Turnip: Mr. J. Hardie.—AMATEURS: Best 4 Auriculas, 4 Polyanthuses, 3 Double Primroses, 2 Early Cabbages; 2nd best 6 Heartseases, 3 Scotch Leeks: Mr. G. Cruickshank. Best 3 Double Wallflowers, 2 Single do., 4 Single Anemones, 2 heads of Broccoli: Mr. Bailie Gibson. Best 6 Heartseases, 3 Scotch Leeks; 2nd best 2 heads of Broccoli, 2 Lettuces: Mr. J. Thompson. Best 2 Lettuces; 2nd best 4 Polyanthuses, 3 Double Primroses, 2 Single Wallflowers, 4 Single Anemones, 4 stalks of Rhubarb: Dr. Cook. Best 4 stalks of Rhubarb; 2nd best 3 Double Wallflowers, 2 Early Cabbages: Mrs. D. Berwick.—COTTAGERS: Best 4 Scotch Leeks, Mr. D. Scott. The 2nd best 4 Scotch Leeks, Mr. W. Morris.

Limerick Horticultural Society, April 30.—The judges of flowers on this occasion were Mrs. Waller, of Castletown-house, and Mr. Bridgford, jun., of Dublin: For fruits and vegetables: G. Tuthill, Esq., of Faba, and Capt. Joyce. There were 12 competitors, and the following are the awards:—1. To Mr. Heafy, gr. to Lord Clarina, 7 prizes, for best Pears, best dessert Apples, and 2nd best do.; 2nd best Geraniums, 2nd best Asparagus, and best Cucumbers. 2. Mr. Carmody, gr. to W. Monsell, Esq., 6 prizes, for best Strawberries, best Orange Trees, best Cauliflower, best ½ pint Peas, and best dish of Potatoes. 3. Mr. Mack, gr. to Mrs. Cooper, 6 prizes, for best Self-coloured Auriculas, 2nd best Anemones, 2nd best Herbaceous Plants, 2nd best Tulips, 2nd best Rhubarb, and 2nd best Pōtatoes. 4. Mr. Kenny, gr. to Poole Gabbett, Esq., 5 prizes, best Cactus, and best collection; the best 6 Herbaceous Plants, 2nd best Stove Plants, and best Kidney Beans. 5. Mr. Horan, gr. to B. Waller, Esq., 2 prizes, best 6 Single Tulips, and 2nd best Double. 6. Mr. Kelly, gr. to J. Russell, Esq., 5 prizes, the best 6 named Auriculas, 2nd best collection of Geraniums, the 2nd best Greenhouse Plants, and 2nd best Pansies, with an honorary prize for an Orange Tree. 7. Mr. Gaynor, gr. to Capt. Stackpoole, R.N., 3 prizes, 2nd best Broccoli, 2nd best Cabbage, and best collection of Vegetables. 8. Mr. Grady, gr. to M. Honan, Esq., 5 prizes, for best Asparagus, 2nd best Cucumbers, best Primroses, best Ranunculuses, and best Double Tulips. 9. Mr. M'Donagh, gr. to Wm. Lloyd, Esq., of Limerick, 5 prizes, best Tender Annuals, best collection of Pansies, 2nd best Cucumbers, best Lettuce, and best Celery. 10. Mr. Gardner, gr. to A. Furlong, Esq., 2 prizes, for best variety of Anemones, and 2nd best Sea Kale. 11. Mr. M'Mahon, gr. to M. Fitt, Esq., 2 prizes for the best Calceolarias, and 2nd best Fuchsias. 12. Mr. Collopy, gr. to G. Bevan, Esq., 20 prizes, for best Cherries, best Camellias, best Ericas, the best Fuchsias, best 6 Geraniums, best Greenhouse Plants, the best collection of Geraniums in flower, best 6 Polyanthuses, best 6 named Roses, best Stove Plants, best Double Stocks, the best collection of Plants in flower, best bouquet of Cut Flowers, best 6 Hardy Shrubs in flower, the best specimen Plant; the best Broccoli, Cabbage, Mushrooms, and Rhubarb.

Shrewsbury and Shropshire Florist and Horticultural Society, April 21st.—This was held at the Town Hall, and the specimens produced were of first-rate quality, and reflect much credit on the taste and judgment of the growers. The judges on the occasion were the Rev. J. M. Wakefield and Mr. King, Shrewsbury. The following is a list of the prizes:—Auriculas: Best Edge, Mr. Roberts, Jingling Johnny; best Self, do., Telemachus. Green: 1st, Mr. Roberts, Booth's Freedom; 2nd, Mr. Groves, Oliver's Lovely Ann; 3rd, do., Page's Champion; 4th, Mr. Roberts, Howard's Nelson; 5th, Mr. Groves, Lovely Ann Willbraham; 6th, do., Highland Boy. Grey Edge: 1st, Mr. Groves, Conqueror of Europe; 2nd, do., Ringleader; 3rd, do., Juno; 4th, do., Complete; 5th, Mr. Roberts, Lord of Hallamshire; 6th, Mr. Groves, Warris' Union. White: This class consisted of five, and the whole were awarded to Mr. Groves, viz:—Taylor's Glory, Hughes' Pillar of Beauty, Wood's Delight, Wild's Black and Clear, and Maid o' the Mill. Selfs: 1st, Mr. Roberts, Ned Ludd; 2nd, Mr. Groves, Blue Bonnet; 3rd, W. Bayley, Esq., Trusser; 4th, Mr. Groves, Flora's Flag; 5th, Mr. Roberts, Stadtholder; 6th, Mr. Groves, Lee's Eclipse. Alpines: 1st, Mr. Roberts, Fair Rosamond; 2nd, do., True Blue; 3rd, Mr. Groves, Seedling; 4th, do., Incomparable; 5th, Mr. Roberts, Burning Sun; 6th, Mr. Groves, Shrewsbury Beauty. Polyanthus: 1st, Mr. Groves, Defiance; 2nd, do., Bernard's Formosa; best Greenhouse Plant, Mr. Inston; best 3 Greenhouse Plants, Mr. E. Haycock; best Geraniums, Mr. Cassells; best 3 do., do; Cucumbers (best brace), H. Lyster, Esq.; French Beans, do.; Rhubarb, Mr. Smout; Broccoli, do.; Cabbage (3), Mr. Jacob; Early Potatoes, H. Lyster, Esq.; Sea-kale (6), Lord Hill; Nosegay, Extra, do.

Vale of Evesham Horticultural and Floral Society, April 22.—The first exhibition for the season was held at the Town Hall, when the following prizes were awarded: Auriculas, Green-edged—1st prize, Wood's Lord Lascelles, John Clark, Esq.; 2nd, Stretch's Alexander, Wm. Barnes, Esq.; 3rd, Galloway's Glory, Mr. H. Drury. Grey-edged—1st, Warris's Union, Wm. Barnes, Esq.; 2nd, Rifleman, Mr. H. Drury; 3rd, The Lord of Hallamshire, Wm. Barnes, Esq. White-edged—1st, Hughes's Pillar of Beauty, John Clark, Esq.; 2nd, Unknown, Mr. Wintle; 3rd, Leigh's Venus, Monsieur Edouard. Selfs—1st, Bradshaw's Tidy, Mr. Wintle; 2nd, Berry's Lord Primate, Wm. Barnes, Esq.; 3rd, Whitaker's True Blue, Mr. Wintle. Alpines—1st, Barnes's Perfecta, Wm. Barnes, Esq.; 2nd, Miller's Conspicua, Mrs. Ashwin; 3rd, Barnes's Splendidissima, Wm. Barnes, Esq. Polyanthuses, Dark: 1st prize, Buck's George the Fourth, Wm. Barnes, Esq.; 2nd, Seedling, Mr. Clark, Croome. Red—1st, Ellice's Sir Sidney Smith, Mr. R. Whitford; 2nd, Whitford's Beauty of the Vale, Mr. R. Whitford. Hyacinths, Double Red—1st prize, Countess de la Coste, Miss Huntley; 2nd, Unknown, Miss Huntley. Blue—1st, Lord Wellington, Mr. Clark, Croome; 2nd, Pasquin, Mr. H. Drury. White—1st, Virgo, Miss Huntley; 2nd, Sultan Achmet, Mr. Clark, Croome. Pansies, 12 varieties—1st, Rev. J. Harling; 2nd, Wm. Barnes, Esq. Stove or Greenhouse Plants—1st, Maxillaria aromatica, Edward Rudge; 2nd, Banksia ericifolia, Mr. Clark; 3rd, Epacris impressa, Mr. Clark. Hardy Plants—Mr. Clark. Sea-kale—Edward Rudge, Esq. Cucumbers—General Marriott. White Broccoli—B. Workman, Esq. Asparagus—Jas. Ashwin, Esq. Rhubarb—Mrs. O. Cheek. Cabbages—1st, B. Workman, Esq.; 2nd, R. Ashwin, Esq. Lettuce—Mr. E. Haines. Dessert Apples—T. N. Foster, Esq. Cottagers' Prizes: Broccoli—John Sheppey. Pansies—do. Extra Prizes: French Beans—E. Rudge, Esq. Potatoes—James Ashwin, Esq. Fuchsia excorticata—Mr. Clark, Croome. Seedling Pansies—Rev. J. Harling. Seedling Cineraria, Mr. Clark. Coronilla—John Clark, Esq. Hyacinth, Nimrod—Miss Huntley.

MISCELLANEOUS.

New Holland Garden Exhibition.—The Sydney papers contain a long account of an exhibition by the members of the Horticultural and Floral Society of that town. Our readers may be curious to know how such matters are managed in New Holland, and what are the prominent subjects of cultivation there. They will, we think, be surprised to learn that there is very little difference between a garden exhibition at Sydney and one in an English country town. We find no instance of New Holland plants being produced, with the solitary exception of two flowering specimens of the Doryanthus excelsa, each of which was 15 feet long. European plants and vegetables were evidently the great source of interest. At the entrance of the exhibition room, we learn from the "Sydney Herald," the main table was covered with vegetables and fruits. Amongst other articles were splendid Carrots, Cauliflower, Cress, and specimens of Lettuce as large and hard as Drumhead Cabbages in Britain. The Asparagus, Artichokes, and many varieties of Beans and Peas are described as being very fine. There was a magnificent tub of Water Cress, Rhubarb, Mayduke Cherries, and White Strawberries. On another table was a fine sort of common Rue, with Beans, Peas, Cabbage, and White Spanish Onions. The fruits were but few. Among other rarities was a large Gooseberry-bush in a tub, with a considerable number of green fruit as large as hazel-nuts: it was much admired. The show consisted otherwise of Bananas, Strawberries, Kentish Cherries, Oranges, and Loquats. Flowers formed the chief attraction, especially a splendid White Moss Rose, and two or three smaller specimens of the same flower. Among other species we find Pæonia peregrina, a fine collection of Picotees, Gladiolus Colvillii, and a Cactus Ackermanni. The editor of the "Sydney Herald" says, however, that they were trained in a very clumsy manner, with sticks which might have done duty at Donnybrook Fair, instead of neat slender rods of deal. Epiphyllum speciosum and Cereus speciosíssimus, Hoya carnosa (the first time it had flowered in the colony), Sprekélia formosissima, Fuchsia grácilis, Pelargoniums, Calceolárias, Lophospermum scandens, Tropæolum pentaphyllum, Sweet Williams, Cape Bulbs, Nasturtiums, and tall blue Larkspurs, seem to have formed the most attractive subjects. 41 exhibitors are named, and 76 prizes are mentioned as having been distributed among them.

Launceston (*Van Diemen's Land*) *Hort. Soc.*—A description of the first meeting of this Society is contained in the "Launceston Courier;" in which it is stated that the exhibition took place on the 17th Dec. last. Amongst the Vegetables were Beans, Milford and Marrow Peas, Emperor Cabbages, White Norfolk and Stone Turnips, Ash-leaved Kidney Potatoes, Spanish and Potatoe Onions, Radishes, Lettuces, Horn Carrots, and Silver Beet. The Fruits were tolerably plentiful, consisting of Green and Red Gooseberries; Red, White, and Black Currants; Raspberries, White and Black Heart Cherries, dried do., preserved Sloes, Stone Pippin Apples of the previous season, French Crabs, Cucumbers, and Melons. Amongst the Flowers were fine specimens of the Nérium Oleander, Heliotrope, Cockscomb, Cactus speciosus, Myrtle, White Balsam, and Hydrángea, with Verbenas and Bouquets of Roses, as well as of the natural productions of the island. The number of successful exhibitors was 24, and of the prizes distributed amongst them 61. At the conclusion of the meeting the Fruit was distributed amongst the company assembled.

Death of Mr. Andrew Mathews.—We regret to learn that this zealous naturalist died in Chachapoya, in Peru, in November last. He was a man of great diligence, and contributed very considerably to a knowledge of the botany of Peru and Chili.

Double Bearing Apple.—Near the lodge of the Rev. J. Hopton's mansion, at Canon Froome, Herefordshire, may now be seen an Apple-tree, with some of last year's fruit on it, and a fine show of blossom for the next crop.—*Gloucestershire Chronicle, May* 7.

Coniferous Plants.—We learn, by letters from Launceston, that Mr. Ronald Gunn has at length succeeded in finding the rare Athrotaxis cupressoides, and another species with ripe cones, near Lake St. Clair, in the centre of Van Diemen's Land, at the elevation of 3,239 ft. above the sea.

Death of Dr. Vogel.—We last week announced the death of this gentleman, upon the authority of the newspapers. We have now the melancholy task of adding that the intelligence was too correct. Dr. Vogel died at Fernando Po, in consequence of exposing himself too soon after his partial recovery from the African fever. Thus has perished, in the prime of life, one of the most promising of European botanists. His monograph of the difficult genus Cassia, and his other papers on Leguminous plants, had established his reputation as a systematist; while, on the other hand, his papers on the development of the Flowers of Lupinus, and on Albumen, published in conjunction with Schleiden, had placed him in a high rank among anatomists and physiologists. We trust that his papers and collections, which are, no doubt, extremely valuable, will be preserved as an evidence of that zeal which could only be arrested by the hand of death.

GARDEN MEMORANDA.

New Botanic Gardens, Glasgow.—On Saturday, April 30, these beautiful Gardens were opened for the first time. On this occasion the Directors had liberally resolved to admit the public on the payment of a trifling charge, previously to the exclusive opening of the grounds for the subscribers; and the opportunity thus offered, added to the beauty of the weather, was embraced to an extent which proves that this resolution was at once acceptable and well-timed. The Gardens are situated on the north side of the Great Western Road—by far the most beautiful approach to the city, if not the only one which has any pretensions to it—extending to full 20 acres; and, from their aspect, it is difficult to determine whether nature or art has achieved most to afford a fitting location for the floral and botanical treasures of the West of Scotland. The grounds rise in gentle swellings to a considerable elevation, and on the brow of the hill is situated the conservatory of ample dimensions, and constructed on the most approved principles which experience and modern knowledge have associated with gardening and the science of botany. This conservatory contains specimens of almost everything which the ingenuity and industry of man have been able to transplant into this country—from the magnificent botanical treasures of the tropics to their most tiny flower. The grounds generally are laid out with exquisite taste, and of themselves speak in language not to be misunderstood of the care and ability of Mr. Murray, the Curator, whose botanical knowledge and enthusiasm are well known. Although yet in their infancy, the plots presented a perfect flush of the richest offerings of Spring; and, from their beauty now, it is easy to foresee what they will be when they have passed the period of infant youth, and future years and culture bring them to maturity. On the north are seen the terminating hills of the Campsie range, and on a clear day the view is only bounded by the outline of the distant Perthshire mountains; to the south, a beautiful range of country is presented; and the presence of the Clyde, watering the centre of the valley, is easily indicated by the smoky wreaths which ever and anon curl upwards from the funnels of the many steamers which walk our waters; westward the landscape is not less delightful, sweeping, as it does, towards the opening of the Firth; and to the east the eye rests ōn the handsome piles of modern building (which the last few years have called into existence), and on the masts of the shipping at Port-Dundas; the whole being very aptly overtopped by the giant chimney rising at St. Rollox. From this elevated point the grounds slope in green, varied, and thickly-wooded banks, to the classic Kelvin, which is dimpling along the base. Altogether the opening has been most auspicious; and we cannot doubt that the Gardens are greatly calculated to extend the growing taste for the deeply-interesting, instructive, and pleasing science of botany. What with the new and extended grounds, so richly furnished with rare and valuable plants, and the location amongst us of Dr. Balfour, a young and learned professor zealously devoted to the science, our fellow-citizens have now a favourable opportunity of combining the study of an interesting science with healthful recreation. While on this subject, we would suggest to the Directors the gratitude with which a liberty similar to that of Saturday last would be received by a great portion of our citizens, viz., that of visiting these grounds once or twice in the season, upon payment of a small charge. There must be no inconsiderable number of people, with whom the love of flowers amounts to a passion, who are compelled to lavish their fondness on some flower which blooms upon their window-sill. To these the liberty to range through the Botanic Gardens for a few hours would be a holiday of much value; and even for the sake of granting a day's pleasure to the more respectable portion of the community, the Directors may possibly grant the boon which, in addition to other considerations, would be repaid by much gratitude. Although the preparations are not thoroughly finished, it is admitted that this establishment, when completed, will, according to its size, be one of the most perfect in the kingdom.—*Abridged from the Glasgow Herald.*

Groom's Nursery, Clapham Rise.—Notwithstanding the late unfavourable weather, the Tulips at this nursery are in admirable condition. The principal bed, which is upwards of 120 feet in length, presents a gorgeous display of these beautiful flowers; and amongst such an innumerable multitude, we were entirely at a loss to know which was most worthy of admiration. Amongst the *Roses* we particularly noticed Claudiana, a clear white, finely feathered with deep rose, and of an excellent shape; Cerise Blanche, delicately feathered with carmine; Catalani, finely flamed with light rose; Rosa Bianca, very clear, and beautifully feathered with dark rose; Bacchus, a handsome-feathered flower; Groom's Duchess of Sutherland, a bright rose, of excellent shape; and many others, amongst which may be mentioned Aglaia, Lac, Persiani, and Princess Sophia of Gloucester.—*Byblæmens:* Groom's Victoria Regina, a beautifully-formed flower, with a clear white ground, delicately feathered with deep purple; Violet Alexandre, finely feathered with light violet; Louis XVI., a clear white, feathered with dark purple; Michael Angelo, feathered and flamed with rich maroon; Lewald, a clear white, with a feather of rosy purple; with Mentor, or Reine de Sheba, Imperatrix Florum, and Claude, which are excellent flowers of this class.—*Bizards:* Duke of Devonshire, an excellent shape, with a bright yellow ground, and a rich dark brown feather; Catafalque, a clear yellow, feathered with reddish brown; Nourri Effendi, a bold and handsome flower, with a clear ground and a remarkably dark brown feather; Groom's Marshal Soult, a fine yellow, delicately feathered with reddish brown; Fabius, clear yellow, with a purplish brown feather; Marcellus, bright yellow, with a brown flame; and Groom's Duke of Sutherland, which was just sufficiently expanded to show that it would be a beautiful flower, having a fine yellow ground, deeply feathered with rich brown.—*R. A., May* 10.

Reviews.

Cabool: being a Personal Narrative of a Journey to, and Residence in that City, in the years 1836, 7, *and* 8. By the late Lieut.-Col. Sir Alexander Burnes, C.B. Murray. 8vo. 1842.

Now that attention is so strongly directed towards Affghanistan, the appearance of this authentic work is most welcome. On running over its very interesting pages, we find many things relating to climate and vegetation which are well worthy of extract.

The following are a few instances:—Whilst sailing up the Indus, in the beginning of May, Sir A. Burnes observed the temperature of the air, near Dera Ghazee Khan, to be 108°, whilst that of the river was 84°. On reaching Musan, July 22d, the thermometer rose to 115°, and in the smaller tents it reached to 135°; the mercury at sunset not sinking below 100°. Near Bassoul and Butteecote, the mountains were thickly clad with Pines and Julgoozas (?), while their summits were covered with snow. Not far from these is Kuju, so famed for its Pomegranates without seed, although by far the finest are brought from villages half-way up the mountains. The growers of this fruit were at that time, Sept. 11th, within twenty days of their harvest. The tree differs altogether in appearance from the common Pomegranate, and only grows in a few Affghan villages, which are delightfully situated above Kuju; the finest comes to greater perfection if sheltered from the sun; 1,500 or 2,000 camels laden with it leave the place annually, and it is sold for three rupees a hundred. The rind is also used at Cabool in the preparation of leather, which, by means of it, is dressed in a superior manner.

In the royal garden of Neemla, Cypress trees alternated with the Chinar or Plane tree, each attaining to the height of 100 feet, and, as the Persian verse has it, "holding each other by the hand, and rivalling each other in beauty."

After leaving Cabool, on the 13th of October, on a journey to the northward, he halted at Kareez-i-Meer, about fifteen miles from which a vast vista of gardens could be seen, extending thirty or forty miles in length, and half as broad, terminated by the vast mountain Hindoo Koosh itself, white with eternal snow. Throughout nearly the whole of the route from thence to Kahdura, the road led through beautiful orchards, the banks of which were clustered over with wild flowers, many of them common in Europe, and which were also abundant along the margins of the innumerable brooks which intersected the valleys. The roads were, in many places, shaded by lofty Walnut trees, which excluded the sun's rays, never powerless in that climate. Every hill with a southern aspect had a vineyard on it; and the Raisins were spread out on the ground, which imparted a purple tinge to the hills.

The food of the natives of the northern province of Kohistan consisted principally of Mulberries, dried and pounded into flour; to which heating diet they gravely ascribed the desperate habits which have become familiar to them. On the southern side of Hindoo Koosh, whose summit is of pure granite, and 15,000 feet high, the snow only extended four or five miles, while on the northern it reached eighteen or twenty; a difference of climate which appeared to be characteristic of those regions. The country near Chareeken is described as presenting a scene of unrivalled cultivation, being intersected by clear and rapid brooks; and Kohistan Proper, as a country rich without parallel. The fertility of the soil is only equalled by the industry of the natives, who, forming bank above bank, acquire, as it were, land from their stony hills, all of which they irrigate with admirable care and zeal. Aqueducts were often seen fifty or sixty feet up the hills, conducted round every swell and valley, until they at length poured out their contents on the embanked fields. Wheat, in this part, seldom yielded more than fifteen-fold; Rice, generally from sixteen to eighteen, and Juwarree as much as fifty-fold. The Affghans preserve their Cabbages, Carrots, and Turnips, in the same way as Potatoes, placing them in the ground, with a small portion of mould and leaves over them, by which means they are kept fresh till April.

The rivers in the vicinity of Begram (supposed to to be the "Alexandria ad calcem Caucasi") were found to be well stored with fish and various kinds of waterfowl, amongst which were forty-five different species of duck. But the *rara avis* is the Kubk i Duree, a bird somewhat less than a turkey, of the partridge kind. Bears, wolves, foxes, lynxes, and hares, with a few other animals, are likewise to be found; many of which are hunted by the Affghans for the sake of their fur. Around Cabool, the water at the beginning of November is let in upon the land to freeze, after which the flocks browse upon the slender leaves of the Wheat, without injuring the plants, which are said to grow up stronger in spring in consequence of this treatment. The orchards also at the same time receive their last irrigation. At this season, the snow first began to fall; but by the 11th of December, the ground in the city was fairly covered, and the cold became severe, so that the whole of the population appeared clad in sheep-skins. On the 26th of February, the Willow was in blossom; on the 11th of March, the first flower of spring, or the "Sosun," a small sweet-smelling Iris, made its appearance; and on the first of April the Apricots showed their blossom. Burnes says that the cold was not very intense, but that the severity of the winter at Cabool varies greatly in different years.

Sir Uvedale Price on the Picturesque: with an Essay on the Origin of Taste, and much Original Matter, by Sir Thomas Dick Lauder, Bart. 8vo, pp. 586. Edinburgh, Caldwell and Co.; London, Orr.

This is a beautiful edition of an admirable work, illustrated with an abundance of highly-finished wood-engravings from the artist-like designs of Mr. Montagu Stanley. We need not tell our readers that Price's Essay on the Picturesque is a work which conveys the most just ideas of what constitutes the natural beauty of a country—that the good taste of the author enabled him to perceive the errors into which the landscape-gardeners of the early part of the present century had fallen; and that the feelings which, on account of his station in society, he necessarily possessed in common with the gentlemen of England much facilitated his appreciation of what constitutes picturesqueness in the minds of the higher classes. To use the language of his editor—"The exquisite and highly-cultivated taste which he displays and the nice discrimination which he exhibits in that range within which he confines himself, and in which the great majority of his readers are naturally most interested, has uniformly excited the admiration of all who have perused his Essays, which will be found to contain much, if not all, that is requisite for the promotion of landscape-gardening upon the best principles." The chief error that he fell into was that of sacrificing convenience and comfort on some occasions for the sake of picturesque effect, and of overlooking or undervaluing on that account the beauties of quiet scenery. To prefer on all occasions a steep and rugged bank, overgrown with briers and weeds, to a trim slope or a highly-kept and level greensward, was like preferring a ragged gipsy-girl to a well-dressed gentlewoman, and was to sacrifice beauty to circumstances agreeable only to the eye of a painter. But these, as all violent opinions, have their antidote in the good sense of the world; and, like the extravagances of Turner the academician, only serve to show the eccentricities of genius. We are glad to observe that the good taste of Sir Thomas Dick Lauder has led him to check such ebullitions, when they occur, by his own sober observation.

Repton and Price may be regarded as the two best writers we have on Landscape Gardening—both different and both excellent. The mean of the two will be found the surest path to success in the management of scenery; and fortunately everybody is now in a position to study that mean, for the present publication is a fitting companion to the cheap and very useful 8vo edition of Repton's Works, published a year or two ago by Mr. Loudon.

We should add, that in addition to numerous judicious editorial remarks intermixed with, but distinguished from, the text of Sir Uvedale Price, Sir Thomas Dick Lauder has prefixed to this volume an essay, by himself, on "the Origin of Taste," in which the philosophical grounds on which the principles of taste depend are very ably and agreeably discussed.

The Heraldry of Fish (8vo, Van Voorst, 1842) is a collection of heraldic devices and armorial bearings of all countries, in which *fishes* form a part of the cognisance. The work scarcely comes within our objects; we must therefore content ourselves with saying, that the author, Mr. Moule, has exhibited great industry in collecting evidence, which he has arranged with skill, and that his book is illustrated with a large number of excellent woodcuts. It cannot fail to be acceptable to those who would study heraldry with some higher object than that of tracing pedigrees or emblazoning coats of arms.

Popular Cyclopædia of Natural Science: Botany. (12mo. Wright, Allis and Co., 1842).—This is one of those publications which every day brings forth to satisfy the demand of the public for cheap books on Natural History. It is, for the most part, a compilation, often word for word, and not a skilful one, from the elementary works of Professor Lindley: many of the woodcuts and much of the matter are coarsely copied from his "Ladies' Botany;" diagrams from his "School Botany," and other things from other places. Even the inadvertent errors of the "Ladies' Botany" are followed; as, in the case of the genus Trollius, whose petals were in the original edition of that work called tubular; this slip was corrected in the abridgment of it, but stands unaltered in the work before us. How much of the matter is original we cannot undertake to say; if, however, we are to judge of its quality by the following specimen which has caught our eye, we certainly cannot express a favourable opinion of it. At p. 397 is an analytical table of the natural orders of Thalamifloral exogens; the characters therein assigned to the last five orders are as follows: *Berberideæ*, anthers with valves; *Cruciferæ*, placentæ in axis; *Caryophylleæ, Linaceæ, Rutaceæ:* placentæ parietal. Now all anthers have valves, and therefore the character assigned to *Berberideæ* distinguishes it from nothing; *Cruciferæ* have the placenta parietal, and not in the axis; and none of the three last orders have the placenta parietal: on the contrary, in *Caryophylleæ* it is free central; in *Linaceæ* and *Rutaceæ* it is in the axis. This is very bad.

Pereira's Materia Medica has rapidly arrived at a second edition. The Botany of Materia Medica, a most important department, often treated much too superficially in works of this description, is here prepared with the greatest care: the origin of drugs having been for many years a subject to which the author has most particularly directed his attention. The reader will find it a very authentic source of information concerning the application of plants to medical purposes, and the sources from which drugs are derived. It forms two thick 8vo volumes, and is illustrated by numerous woodcuts.

Bischoff's History of the Woollen and Worsted Manufactures is a well-arranged and very full account, firstly, of the wool-trade from the earliest historical period down to the present day; of the legislative enactments which have influenced its progress, and of the causes which have led to its decline; and, secondly, of the numerous races of sheep and sheep-like animals whose fur has been employed in manufactures. The book is replete with valuable information, and forms an important work of reference for sheep-farmers and woollen manufacturers. It is illustrated by good figures of some of the most esteemed breeds of sheep.

CALENDAR OF OPERATIONS *for the ensuing week.*

The late rains have fallen most opportunely (in this part of the country, at least), and have put the ground into excellent condition for planting, which is now the principal business to be attended to. It will be well, therefore, to use every exertion in turning to a good account a more favourable opportunity than generally occurs. As in a flower-garden so much of its beauty and pleasing effect depends upon the tasteful blending of the various colours, combined with an artistical arrangement of the plants according to their respective heights and season of flowering, these points should be most particularly attended to in planting; this, however, is a subject which ought previously to have occupied the mind of the gardener, and nothing should now remain to be done but the operative part of the business.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Stools from which the fruit have been cut may, if necessary, be made to produce suckers. For this purpose they should be shaken out of the pots, and, after shortening the leaves and trimming the roots, repotted in small pots and rich compost, and plunged into a brisk bottom heat. Scarce sorts might be increased in this way with great advantage. Some varieties of the Pine-apple are disposed to throw out a great number of gills from the stem, immediately below the fruit. If these are permitted to grow, they will materially affect the swelling of the fruit, by taking away a considerable portion of sap; it will be better, therefore, to remove them when young, taking care not to injure the stem by cutting too close. Top-dress fruiting plants as soon as they have done flowering, in the way formerly described.

Vinery.—The late sunny and dry weather has been peculiarly favourable to the increase of the red-spider in forcing-houses. Vines are less difficult to keep clean than many other plants, because the under surface of the leaves, where the insects chiefly harbour, is more easily accessible to moisture, which is one of the best remedies, although the usual mode of applying it through a coarse-rosed syringe is clumsy, and injurious also when much force is employed. A better method would be to fill the houses with vapour occasionally by means of some contrivance affixed to the heating apparatus. Sulphur laid upon the flues or pipes, when warm, is strongly recommended by some, but caution is requisite in using it. In those houses set in action early in January, the fruit will now be beginning to change colour, and all the light possible should be admitted to it, together with a liberal supply of air when practicable.

Peach-house.—Where fruit is ripe, all that is necessary is to expose it freely to light and air, and to maintain a dry atmosphere, for which purpose a little fire-heat will still be requisite in very damp weather. If mildew appears in any of the houses, moisten the infected shoots and then dust them with sulphur. Thin the fruit in the latest house, and let it advance slowly, according to nature; it might be forwarded after stoning if required.

Cherry-house.—If any trees are cleared of fruit, take them out of the house; their places may be occupied by part of those from the second house. The exposed trees must not be neglected, however, but should be regularly watered and the foliage kept free from insects, as before.

Fig-house.—Trees in pots, from which the first crop has been taken, should be encouraged to bring forward their second produce. Give them liquid manure now and then, and keep the leaves clean by frequent washings with a syringe. To those that are in the state alluded to in last week's Calendar, continue the treatment there recommended.

Strawberries.—The fruit now produced will generally be much finer than that which was forced earlier. Assist it in swelling to a large size by plenty of food, which might readily be supplied in the form of manure water. The boxes of soil beneath the pots, formerly mentioned, will also be found very serviceable.

Cucumbers and Melons ought never to be neglected, howsoever pressing other business may be. Suspension of dressing for only a few days would be productive of injury, especially if cold and dull weather should occur after the thinning of the superabundant shoots that had been permitted to form. Ridge Cucumbers might be put out as soon as a little heat is found in the dung. Keep the hand-glasses close for some days, shading in bright sunshine, and covering with mats at night.

Shift Capsicums and Egg-plants intended to fruit in pots. The most forward Tomatoes may be planted out at the foot of a south wall, protecting them with hand-glasses till they get hold of the ground. Also plant out New Zealand Spinach from pots.

Out-door Department.

Many kinds of vegetable seeds come up very irregularly this season; see, therefore, that no deficiency of consequence occurs in the young crops. If any is found, resow immediately with fresh seed.

Broccoli.—Plant out Cape and Grange's Early White from the first sowing; these will come in usefully in autumn, to supply the place of late Cauliflowers, if the season is unfavourable to the latter.

Brussels Sprouts.—A few rows of these, and likewise of Borecole sown at the same time, should be put out now to produce an early supply.

Cabbages.—Plant largely of the different sorts sown in spring; the smaller ones may stand in the seed-beds two or three weeks longer, when if transplanted they will give a successional crop.

Cauliflowers.—Put out a good breadth of the spring-sown plants. If ground is scarce, the alleys between the Asparagus-beds may be occupied by these.

Ice-plant.—The cold-looking, ice-covered leaves of this plant make it very suitable for garnishing fruit during the hot weather of summer; a few plants should, therefore, be selected from the bed of annual flowers, and planted in rich soil, to make the leaves succulent.

Kidney-Beans.—The dwarf kinds may be sown on an open quarter.

Lettuce.—Transplant the first crop, if not already done.

Onions.—Hoe between the rows, and keep the young plants clear of weeds.

Peas.—The first transplanted crops, and those sown in autumn, will now be in full blossom, and the pods may be forwarded a little by pinching off the tops of the plants, to stop their upward growth.

Potatoes.—Loosen with a hoe the surface of the soil between the rows of all that are above ground.

Orchard.—Continue to thin wall fruit of all sorts as it becomes large enough, leaving a heavier crop than common upon luxuriant trees. Green Apricots are in many families prized for tarts, and some should be kept back for that purpose. Look over Apricot-trees, and destroy all the grubs that prey upon the shoots before they are transformed into pupæ. The green fly has probably begun to breed upon Peach-trees, in which case they ought to be syringed with tobacco-water, or the infested shoots might be moistened, and then dusted with strong snuff. Nail the growing shoots of young trees before they become long enough to be broken by the wind, which would spoil the symmetry of the trees. In warm situations wall Vines will now require dressing and nailing. If the late dry weather has hardened the ground at the foot of the walls, the surface of the alleys should be forked over and loosened.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Many Orchidaceous plants will now be in full growth; give them a liberal supply of water, and shade them during bright sunshine. If this is not attended to, the leaves will get yellow and sickly. Look over those which are hung up, and if there is any difficulty in keeping them moist enough, put some fresh sphagnum round them; such plants as Aérides odoratum and the Saccolábiums will not succeed unless they are kept very moist and warm.

Greenhouse and Conservatory.—If the weather is fine, the whole of the plants that it is purposed to place in the open air may be removed from the house to their summer quarters; this however might, if more convenient, stand over till the main planting is finished, when more time can be spared for the re-arrangement of the house. In warm and calm nights the sashes should not be closed. Many hard-wooded plants may be freely propagated now by cuttings of the young shoots. Observe that the necessary waterings are not omitted in the hurry of this busy time.

Pits and Frames.—Shift Chrysanthemums that require it, and put in more cuttings to flower later. If rooted slips of Cinerarias are taken off now, and properly attended to hereafter, fine plants will be obtained to bloom early in spring. By saving seed from the best sorts, a great variety of this highly ornamental and useful plant may be obtained; and if the seed is sown as soon as ripe, the plants produced from it will bloom next spring. Repot Auriculas (see Vol. I. p. 396.)

Out-door Department.

Here there is now much to do, the season having arrived for the transfer of all kinds of plants not hardy enough to bear our winters, to the vacant beds and borders of the flower garden, the gaiety of which, during summer and autumn, will be dependent in a great measure upon the judicious performance of this operation. Use despatch in planting; still, let nothing be hurriedly or carelessly done. If the weather is dry, give the plants a good watering before the soil about them is made level. Thin annuals where the patches are too thick. The most forward Dahlia plants may now be planted out. Some suggestions for a harmonious arrangement of the colours of these will be found at Vol. 1, p. 291.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Buds of last and grafts of this season ought to be looked over from time to time, and all shoots that spring from the stocks destroyed. Pay attention to the weeding and watering, when necessary, of young transplanted seedlings, for if neglected while weak and delicate many of them will perish.

FOREST AND COPPICE WOODS.—Continue the felling and peeling of Oak. The spray should be faggoted, and the branches piled in heaps ready for carting as the work proceeds.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending May 12, 1842, as observed at the Horticultural Garden, Chiswick.

May		Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean.	Wind.	Rain.

The highest temperature during the above period occurred on the 15th and 17th, 1833—thermometer 86°; and the lowest on the 15th, 1838—thermometer 26°.

REPORT ON COVENT GARDEN MARKET,

For the week ending May 13, 1842.

THE late heavy rains have considerably shortened the supply of many kinds of Vegetables during the past week. Hothouse Fruit has, however, been tolerably plentiful. *Fruit.*—The supply of Pines is good, at a reduced price, from 6*s.* to 12*s.* per lb. Fine Grapes are also abundant, from 5*s.* to 10s. per lb. Peaches and Nectarines still continue very scarce, and fetch from 15*s.* to 30*s.* per doz. Cherries are rather more plentiful, from 15*s.* to 20*s.* per lb.; and green Apricots are selling at 1*s.* per pottle. Pears of good quality seem to be entirely over. The supply of Apples has been good, and trade has been brisker than during the preceding week; the prices of both the dessert and kitchen kinds continue the same. Strawberries are abundant, from 4*d.* to 9*d.* per oz. Amongst them we observed some very fine samples of Myatt's Pine and Myatt's Eliza. Green Gooseberries have made their appearance during the week, and are selling from 6*s.* to 8*s.* per half-sieve. Cucumbers are from 1*s.* to 3*s.* per brace. *Vegetables.*—Broccoli is not so plentiful, and has advanced somewhat in price. Cauliflowers are to be obtained from 4*s.* to 9*s.* per dozen. The supply of Asparagus has been rather limited, owing to the heavy rains, and the price has risen about 1*s.* per bunch. New Potatoes are cheaper than in our last report, being from 9*d.* to 1*s.* 3*d.* per lb. A large quantity have appeared from Cornwall, which are selling from 2*s.* 6*d.* to 5*s.* per doz. lbs. Young Carrots fetch from 1*s.* to 2*s.* per bunch. Cos Lettuces are improving, and fetch from 1*s.* to 2*s.* per score. Rhubarb is very good and abundant, from 4*s* to 6*s.* per doz. bundles. *Flowers.*—These have been very plentiful; we observed amongst the cut ones fine blooms of Cactuses, Ixias, Calceolárias, Cloves and Yellow Picotees, Azáleas, and white Moss Roses.

PRICES SATURDAY, MAY 14, 1842.—FRUITS:—

Apples, Kitchen, per bush. 4*s* to 8*s*
— Dessert, per bushel, 5*s* to 14*s*
Strawberries, forced, per oz., 4*d* to 9*d*
Peaches, per doz. 15*s* to 30*s*
Nectarines, per doz., 15*s* to 30*s*
Apricots, green, per pottle, 1*s*
Pine Apple, per lb. 6*s* to 12*s*
Grapes, hothouse, per pound, 5*s* to 10*s*
— Spanish, per lb., 2*s* 6*d* to 3*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 9*d* to 2*s* 6*d*
— per 100, 5*s* to 16*s*
— Bitter, per 100, 8*s* to 20*s*

Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Cucumbers, per brace, 1*s* to 3*s*
Cherries, per lb. 15*s* to 20*s*
Gooseberries, green, per doz. pottles, 6*s* to 8*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Walnuts, per bushel, 14*s* to 24*s*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, White, 1*s* to 2*s*
Cabbage, Red, for pickling, 2*s* 6*d* to 3*s*
Cabbage Plants, per doz., 2*s* to 5*s*
Broccoli, White, p. bnch., 2*s* to 4*s*
— Green, 1*s* to 1*s* 6*d*
Cauliflowers, per doz., 6*s* to 15*s*
Kidney Beans, forced, p. 100, 2*s* to 3*s*
Potatoes, per ton, 45*s* to 90*s*
— per cwt 2*s* 6*d* to 5*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
— New, per pound, 6*d* to 2*s*
— — Cornish, per doz. lbs., 2*s* 6*d* to 5*s*
Turnips, young, per bunch, 1*s* to 3*s*
Carrots, young, per bunch, 9*d* to 2*s*
Parsneps, per dozen, 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* to 8*s*
Radish, per doz. hands (24 to 30 each) 6*d* to 1*s*
— Turnip, p. doz. bch., 6*d* to 1*s* 6*d*
Spinach, per sieve, 1*s* to 1*s* 6*d*
Chives, per pot, 3*d*
Leeks, per dozen bunches, 1*s* to 1*s* 6*d*

Garlic, per lb. 1*s*
Shallots, per lb., 2*s* 6*d*
— Green, per bunch, 3*d*
Onions, per half sieve, 3*s* to 4*s*
— for pick., per hf.-sieve, 4*s*
— Green, per doz. bches., 1*s* to 4*s*
Asparagus, per 100, large, 6*s* to 8*s*
— Second or Middling, 4*s* to 5*s*
— Sprue, or Small, 1*s* 6*d* to 2*s* 6*d*
Lettuce, Cabbage, p. score, 6*d* to 1*s* 6*d*
— Cos, 9*d* to 2*s*
Endive, per score, 1*s* 6*d*
Celery, per bundle (12 to 15) 6*d* to 1*s* 6*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch, 6*d*
Parsley, per half sieve, 9*d* to 1*s*
Tarragon, per dozen bunches, 2*s* to 3*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s*
Mint, per dozen bunches, 1*s* 6*d* to 2*s*
Marjoram, per doz. bunches, 2*s*
Basil, per doz. bunches, 2*s*
Rhubarb Stalks, doz. bundles, 4*s* to 12*s*
Mushrooms, per pottle, 10*d* to 1*s* 6*d*

Notices to Correspondents.

G. B. informs us that the CLIANTHUS PUNICEUS, mentioned at p. 269, stood out through the winter of 1840-41.

A. H. C.—Your plants are,—1, Spigélia marylándica; 2, Reaumúria hypericoides; 3 is not to be found in "Paxton's Botanical Dictionary."

Penny.—You will perhaps be able to obtain good specimens of BRITISH GRASSES from Mr. Gardiner, of Dundee, whose advertisement you will perceive in this week's *Chronicle.*

Lomax.—The sulphur which you placed upon your hot-water pipes to destroy the RED SPIDER, will, no doubt, have effected that purpose. The manner in which it acts is by giving off a noxious gas or vapour, which is deleterious to these insects; but it will still remain adhering to the pipes, although its strength will, in a great measure, be gone. If your Vines are still affected, keep your house as damp as possible. Tobacco is of no use in destroying these pests.

Sand-Marten.—Violets, unless good specimens are sent, are the most difficult things in the world to determine; however, No. 4 is Víola palmata; 6, Androsace septentrionalis; 7, Arenária baleárica.

Simple.—No. 3 is Lasiopetalum solanáceum; 4 and 5 are species of Thymus; 1 and 2 are Begónias, but we really have not time to ascertain their species.

Inquirens.—It is not essential to the health of VINES that they should be exposed to the external temperature during winter, if the Greenhouse or Vinery in which they grow is merely kept a few degrees above the freezing point during that season.

Florecolist.—Your plant is some kind of O'cymum or Basil, but in its present state we cannot determine which species it is.

Malachi.—SEEDS from the BRAZILS and from the neighbourhood of Rio de Janeiro, may be successfully grown in a hotbed. They cannot be preserved afterwards, nor kept in a flowering condition, in a greenhouse, but will require the treatment of hothouse plants.

P. G.—The VARIATION OF COLOUR in your Geraniums is really a singular circumstance. In those of the Gem which you have sent us, the one flower is of a bright rosy carmine, while the other is a purplish lilac. This is one of the freaks of Nature for which no cause can be assigned.

S. F. P.—By no means cut the young shoots of your newly-planted Asparagus-beds: they will be much improved if not cut for a year or two to come.

D—d.—The two plants are the sexes of Petasites vulgaris; No. 1 is the female, No. 2 is the male.

J. B.—DANDELION is prepared for salad by merely taking up strong roots in autumn and blanching them in winter, by putting them in a cellar where the frost cannot reach them. Nothing is more easy than to force them then, and nothing more difficult than to swallow them when forced. They are as bitter as soot.

R G. Y.—It will never do to introduce a tan-bed into your GREENHOUSE under the stage, for the sake of increasing the heat. Supposing there were no objection on the score of expense, you would have to contend with the occasional moisture of the tan when you might want a dry air, and it would soon lose its heat altogether. A brick flue, which you say you have, must be very unskilfully contrived not to give heat enough.

B. S. We can only say that NITRATE OF SODA is sold by the ton or cwt. by all drysalters who have any trade, and by all respectable dealers in artificial manures. We really cannot recommend one person rather than another.

A Subscriber.—We at present know very little about GUANO. It is extremely powerful. A handful in a couple of gallons of water is the proportion we should employ as liquid manure for trial.

J. B. R.—FLOWERS become DOUBLE both by the conversion of stamens into petals, and by the increase of number of petals, and sometimes by the conversion of the young seed-vessels into petals. Dahlias however, Chrysanthemums, Marigolds, and similar flowers, belonging to the Composite order, become double from a very different cause. In such cases the corollas in the centre of the flower-head change from a tubular to a ligulate, or strap-shaped form. Much obliged for your advice.

H. D. B.—Certainly. GAS, if by that name you mean street-gas, is very prejudicial to plants in a conservatory, and should never be employed either for lighting or heating plant-houses.

T. A.—No doubt PERCH will become tame by being constantly fed. But what then?

J. B. M.—Your SEEDLING FU'CHSIA is by far the finest hybrid we have seen, the flower being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus.

L. L.—PETU'NIAS and SA'LVIAS raised from seed this spring will flower in the autumn. The leaves which you sent appear to be those of the Viburnum dentatum. Only 4 of the Numbers which you want of last year's *Chronicle* can be obtained at the office; by inclosing stamps to their amount, with your direction, you can have them sent to you. As these also are nearly out of print, the sooner you send, the better. Mr. Burke's Manual of "Cottage Economy and Cookery" will be published in about a fortnight's time in the Journal of the Royal Agricultural Society.

T. Appleby.—No 1. of your Oncidiums was very much crushed, but appears to be O. digitatum. 2. O. longifolium. 3. O. ascendens.

Ruricola.—The best works on Algæ, with plates, are, Turner's Historia Fucorum, for species, and Greville's Algæ Britannicæ, for genera.

H.—When STABLE DUNG is placed in a heap, and made to heat, for the purpose of warming the earth of a Cucumber-bed, all its most active parts are driven off and lost. What remains at the end of a season is comparatively inactive, though no doubt still of much value. If stable dung is used to produce heat, such a loss must be submitted to, for it cannot be avoided; but we are persuaded that the time is at hand when hot water will be used for heating purposes, and the dung applied to the purposes for which alone Nature intended it.

J. P.—Pearson's BLACK PRINCE is a Pansy of the deepest blue purple, approaching to black, with a patch of rich yellow in the upper part of the lip, or lowest petal, containing a few distinct lines running from the colour towards the centre, which is free from marking. It is a flower of very fine properties, round, large, and composed of thick, velvety, well-proportioned petals.

J. S. S.—Your Pansy is a very good one, but not a first-rate flower. The eye is good, and the colour is desirable, as we are deficient in fine yellows: but if you examine it carefully, you will perceive the lower petals, more especially the side ones, are small, and deficient in the form of their outline. The Calceolaria is a pretty variety, rather too long, but worth preserving, if it is of a good habit.

S. G.—Your seedling Pelargónium is not worth preserving. The form is too long, the petals too narrow, the colour common, and the spot not of the right character. The great improvements made in this beautiful tribe of flowers within a few years is such, that flowers of the class to which yours belong are considered out of date. We know nothing of your mixture for destroying slugs; the best we can recommend are quicklime or wood ashes. The best plans to clear your frames of woodlice are to be found at pp. 150 and 165 of last year's *Chronicle.*

Alexis.—Your plants are, 1. Acer montanum, or striatum; 2. Vaccinium amœnum; 3. Lonicera alpígena.

An Under-Gardener.—With regard to the distance above the bunch at which the shoots of VINES should be stopped, there are various opinions. From our own observation of the good effects of Mr. Whiting's system, we have no hesitation in saying that, where leading shoots are not required, if only one clear joint is left above the bunch, it is by far the best and neatest method. This, however, is only applicable to Vines trained on the spur system.

Totty.—It would be easy to give tests whereby particular impurities in different manures might be detected; but it is almost impossible to give simple tests to ascertain their purity. In buying such things, it is better to go to the most respectable dealer rather than to him who charges the lowest price.

Philo-Tasmannia had better inquire of the Secretary to the New Zealand Company in London. We cannot advise him either one way or the other. For agriculturists, there is no doubt of the advantages of the colony; for other trades we cannot answer, as we do not know.

An Amateur.—We cannot tell you the exact proportions requisite to be used for washing the stems of APPLE TREES; but you may mix equal quantities of quicklime, woodashes, and cowdung together; then pour in some soapsuds, stirring the mixture well at the same time, until it is about the thickness of paint. If applied with a brush over the parts infected with LICHEN and moss, it will eradicate them, but will not destroy the larvæ of insects. Tobacco-water is to be procured ready manufactured at the shops; it must be diluted with an equal quantity of water previously to being used.

B. L.—Eight good sorts of Apples in succession from October till July may consist of the Golden Reinette, Maclean's Favourite, Pearson's Plate, Ribston Pippin, Hughes's Golden Pippin, Herefordshire Pearmain, Old Nonpareil, and Sturmer Pippin. All these will succeed as standards. If any are to be favoured with the protection of a wall, the Ribston Pippin and Old Nonpareil are proper.

W. Ford.—Your plants are, 1. Erica echiiflora, var.; 2. E. echiiflora; 3 and 4. cónecolor; 5. E. arbórea; 6. E. hýbrida; 7. E. viscária; 8. Chorozema cordatum; 9. Psorálea pinnata; 10 is in too young a state to be identified; 11. Entelea palmata; 12. a Leptospermum, probably sericeum.

A Friend to Floriculture.—An account of the best method of building and heating GREENHOUSES will be found at p. 763 of last year's *Chronicle*, and at p. 53 of this.

Omega.—We certainly misunderstood your question. PANS OF WATER do not suit any kind of succulent plant; with that exception, they are useful to all plants during summer, exposed to a dry and warm atmosphere, e. g., in sitting rooms.

Carnation.—If the insects attacking the Apple-tree are APHIDES, they may be driven away by tobacco smoke; nothing else will remove them. In directing all the shoots of ASPARAGUS to be cut off, up to a certain time, allusion was made entirely to beds in a state for cutting, not to those in process of formation. If, however, your beds are three years old, they ought to be fit to cut this year.

H. C.—The best form in which to use GYPSUM is in its unburnt state, finely powdered. If you employ plaster of Paris, you must prevent its setting as long as you can. In a few hours, say 10, the smell of the putrid urine will be destroyed if the gypsum is unburnt. We have never *recommended* gypsum in the form of plaster of Paris, though it may be so used, but not with the same advantage as unburnt.

G. W.—Your plant seems a mere form of Catasetum semiapertum.

B.—Ipomœa pes tígridis, as far as we can tell from a leaf without flower.

J. Davis.—Your plant is Hermánnia denudata. The question about Asparagus is answered, or will be, by the "Calendar of Operations." Many methods of killing woodlice have been given in the *Chronicle* of last year, as will be seen by the Index.

Manchester.—Your plant is BISTORT, a troublesome weed. Thorough draining in the first place, and frequent ploughing afterwards, are the remedies you must look to.

Hope House.—Oxylóbium ellípticum, a well-known greenhouse plant.

Vitis has been keeping both the air and soil of his VINES too dry. Although the blossoms ought not to be syringed when in flower, the air ought never to become dry.

Βητα.—GAS WATER will act much more rapidly on your grass land than nitrate of soda. We should, however, anticipate advantage from either. There are many such complaints as yours of Cabbages running to seed this season. Probably it is connected with the unusual length of hot and dry weather this Spring.

F. R. M.—We apprehend your Night-smelling Wallflower is not what is so called here. We mean Hesperis tristis, you perhaps intend White Rocket. At all events the climate of Cork is very different from that of this part of England.

Calder.—We doubt whether you will do your CUCUMBERS any good by giving them old liquid manure. Guano is too little known for us to say anything about it. None of our correspondents have been using it, as you must have seen. Try it by mixing a handful in a water-pot of water.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE chief feature in our news from France is the occurrence, on the Paris and Versailles Railroad, of the most serious accident yet recorded in the annals of railroad travelling. This disastrous event took placed on Sunday evening, when the trains were filled with visitors returning from Versailles, where they had assembled to witness the festivities in honour of the King's birth-day. More than 100 persons were crushed or burnt to death on the spot, and nearly 200 seriously wounded. This melancholy accident produced a deep sensation throughout the country, and its immediate consequence was a serious fall in the value of all railway securities. Some excitement has also been created in Paris by the arrest of a considerable number of the labouring classes, having in their possession a quantity of arms and ammunition of a new description, supposed to be connected with another plot to assassinate the King.—This week has also been signalised by another calamitous event, the destruction of one third of the great commercial city of Hamburgh by fire. It broke out on the morning of Thursday the 5th inst., and lasted until Sunday; during which period no less than 52 streets, 3 churches, and nearly all the public buildings in the commercial quarter of the city, were reduced to ashes. The event, as might have been expected, has entailed general ruin and distress upon the great mass of the population, and the amount of the actual loss is not yet fully ascertained.—From Spain our news is not of particular interest: the Cortes have been engaged with discussions on a bill proposed by the Ministry for a loan of 160 millions of reals, said to be required to carry on the Government; the debate, as far as it has proceeded, presents no feature of general interest, and promises to be long protracted.—From Portugal we learn that the projected commercial treaties with this country are making progress, and that they are likely to be signed in the course of the present month.—Our German news is confined to the comments of the journals on the recent visit of the French Minister, M. Pageot, to Vienna, relative to the marriage of the Queen of Spain; and to speculations connected with another mission on the same subject to the Court of Prussia.—By the last arrivals from New York we learn that the Loan Bill has passed the Senate, and received the signature of the President; Lord Ashburton has been actively engaged in the objects of his mission, and the American journals begin to exhibit a less hostile disposition, and express a hope that there will be a speedy and satisfactory arrangement of all the points of dispute between the two countries.

At home, our news is still confined to the proceedings in Parliament. The Report on the Income Tax Bill has been brought up and agreed to; a variety of amendments were proposed, but they were all rejected by large majorities, and the bill has thus far passed in its original form, with the exception of an addition made by Ministers, extending the proposed exemption of cathedrals and churches to all places used solely for divine worship. Sir R. Peel has brought forward the new Tariff Bill, and has entered into lengthened explanations of its designs and provisions, stating that its main object is the removal of all prohibitive duties, and the general reduction of the existing tariff. Sir James Graham has obtained leave to bring in a bill for the continuation and amendment of the Poor Law Commission; the chief features of the proposed measure are the abolition of the Gilbert Unions, the education of pauper children, and the continuation of the Commission for five years longer.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal continue well. The Queen and Court returned to town from Claremont on Monday. H. R. H. Prince Albert inspected the troops in Wellington Barracks on Wednesday morning, and in the evening presided at the dinner of the Literary Fund Society in Freemasons' Hall. The Queen gave a Fancy Dress Ball at Buckingham Palace on Thursday, which was very numerously attended. The particulars of this *fête* will be found given under our Metropolitan news. The Marquis of Ormonde and the Hon. Capt. Duncombe have succeeded Lord Byron and the Hon. Capt. Hood as the Lord and Groom in Waiting on her Majesty.

Gazette Announcements.—Her Majesty has appointed P. R. Marillier, Esq., to the office of Civil Commissioner and Resident Magistrate for the district of Somerset, in the colony of the Cape of Good Hope. Sir W. Gomm, who recently assumed the command of the Chester district, has received the appointment of Governor of the Mauritius, vacant by the death of Sir Lionel Smith. The Queen has conferred the honour of Knighthood upon Cresswell Cresswell, Esq., one of the Justices of her Majesty's Court of Common Pleas.

Parliamentary Movements.—Lord A. Hervey has been elected for the borough of Brighton, in the room of Mr. Wigney, who has accepted the Chiltern Hundreds. The Southampton Election Committee have decided that Lord Bruce and C. C. Martyn, Esq., were not duly elected for that borough, and that they had been by their agents guilty of bribery. The Newcastle-under-Line Election Committee have declared that the last election for that borough, as far as it regarded J. Q. Harris, Esq., was a void election; that the said J. Q. Harris, Esq., was, by his agents, guilty of bribery, but that it did not appear by the evidence that this was with Mr. Harris's knowledge or consent. A new writ has been ordered for the county of Londonderry, in the room of Sir R. Bateson, who has accepted the Chiltern Hundreds. The New Windsor Election Petition has been abandoned.

Foreign.

FRANCE.—*Accident on the Versailles Railroad.*—The capital and its neighbourhood were on Sunday evening thrown into a state of great alarm and excitement by the occurrence of a very serious accident on the Paris and Versailles left bank railway. It appears that Sunday was fixed for the celebration of the King's *fête* at Versailles, by the display of the great waterworks and fireworks; and on this occasion Versailles was crowded to an unusual extent with visitors from the capital. At the conclusion of the display of waterworks, about half-past five, a great number of persons proceeded to the terminus of each line of railroad, there being two, and took their departure for Paris. The train of the left bank was unusually long; it consisted of 17 carriages, impelled by three engines, and conveyed from 1,500 to 1,800 passengers. On arriving between Meudon and Bellevue the axle-tree of the first engine broke, and the body of it, with the fire, fell to the ground. The second engine, so great was the impetus, broke it in pieces and passed over it, when the boiler burst, throwing the stoker into the air to a great height. The several carriages, as they came up, passed over the wreck, when six of them were immediately set in flames by the fire of the broken engine; and, being newly painted, they burnt with rapidity. Three were entirely consumed, and three others partially, without the possibility of escape to the inclosed passengers, who, as usual, were locked in. The scene that ensued is described as one of a most painful description, and the confusion that prevailed was extreme. The greater number of the passengers in the two first carriages were killed on the spot—most of them burnt to death, being unable to make their escape from the locked-up carriages. The number of lives lost is variously estimated; but it is stated that upwards of 100 persons were killed or burnt to death, and 150 wounded. Among these are said to be several persons of distinction, including two Deputies; but as a great number of the bodies are so burnt and disfigured that it seems impossible to identify them, considerable uncertainty at present prevails as to who the unfortunate individuals are. It appears that M. Guizot was on the line at the time. He went to Versailles by the half-past five o'clock train, and the accident happened to the one returning at that time. Regiments of troops were immediately put on the line to keep off the populace, who were greatly excited, and who made an attempt to destroy the railroad, which, however, they were prevented doing. The sensation produced in Paris by the announcement of the accident was extreme, and railroad shares immediately fell 20 francs.

The Capital.—Some excitement has been created in Paris by the announcement of the discovery of another plot to assassinate the King. Twelve persons belonging to the labouring class were arrested on the night of the 5th inst., and a quantity of petards, arms, and ammunition seized in their possession. Amongst the persons arrested are said to be Considère, who had been twice tried and acquitted before the Chamber of Peers, and Poncelet, who was convicted of having been engaged in the conspiracy of the Rue des Prouvaires and amnestied. On the following day further arrests were made; and on Saturday a number of domiciliary visits were made throughout Paris, particularly in the neighbourhood of the Faubourgs St. Antoine, of St. Denis, and of the Temple; and the keeper of a wine-shop in the Rue des Marais du Temple was arrested. It is added that Quènisset still remains at the Conciergerie, and that these arrests have been made in consequence of information furnished by him. Private letters state that the projectiles seized were of glass, and of the nature of hand grenades, intended for the assassination of the King by being thrown into and exploding in his carriage. The judicial investigation into the affair is proceeding with activity.—The King, Queen, and the Royal Family removed from the Tuileries on Saturday to their summer palace at Neuilly. The Duchess of Nemours and the young Prince are reported to be going on very satisfactorily. M. Guizot was so ill of a cold on Saturday, that he could not attend the Cabinet Council held that day at the Tuileries.—The journals state that "the King has given a significant reply to the Address presented to him by the Archbishop of Paris, relative to the desecration of the Sabbath, by countenancing the non-observance of the holiday of Ascension (on Thursday), one of the days consecrated by the concordat, by the workmen employed in repairing the Chateau of St. Cloud."

The Cabinet.—It is stated that the Government has decided on dissolving the Chambers, and having the general election in August. The "Temps" states as a rumour, that the Cabinet intend to ratify the treaty relative to the right of search, immediately after the elections; but private letters declare this statement to be unfounded.

The Chambers.—The journals continue to be much occupied with the adjourned debates in the Chamber of Deputies on the Railroad Bill. The first vote since our last has been respecting the railroad to run south, through the centre of France. This railroad, executed as far as Orleans, is to be continued to Vierzon, on the canal of Berry, not far from Bourges. The extension of the railroad to Clermont, as well as that to Toulouse, was rejected. On Saturday the Chamber passed the *ensemble* of the first article of the bill, classing the railroad lines as follows:—1. From Paris to the Belgian frontiers. 2. From Paris to the Channel. 3. From Paris to the frontiers of Germany, by Nancy and Strasbourg. 4. From Paris to the Mediterranean, by Lyons, Marseilles, and Cette. 5. From Paris to the frontiers of Spain, by Tours, Bordeaux, and Bayonne. 6. From Paris to the Ocean, by Tours and Nantes. 7. From Paris to the centre of France, by Bourges. 8. From the Mediterranean to the Rhine, by Lyons, Dijon, and Mulhausen. 9. And lastly, from the Mediterranean to the Ocean, by Toulouse and Bordeaux. The debate then commenced on the mode of execution of all these railroads. The Government proposes a mixed plan, combining the assistance of the State with the competition of private companies and the assistance of the localities interested in the lines. On Tuesday the Chamber voted as far as to the 9th article of the Railroad Bill; an amendment of M. Duvergier de Hauranne to article 2, to the effect that railroads, either totally or in part, may be given up to private industry, on conditions to be specially determined hereafter by the Chambers, having been carried. During the debate, M. Dupin rose, and, alluding to the serious accident that had occurred on the Versailles railway, demanded a law for the police of railroads. M. Teste said that such a law existed in the 8th article, giving the Government power to make such regulation. M. Dupin said this did not suffice. It was a good point to start from, but was not that at which he would arrive. The Government could not establish or inflict new penalties, or any penalty more than five francs. Such a fine was illusory in cases like the disastrous one of Sunday, which had filled the city with consternation. He demanded a penal law to act as a sufficient check on the cupidity which speculated on the lives of citizens. Such a law, he knew, could not be improvised from the tribune, but he thought it right that the commission should be aware of the necessity. M. Teste agreed, but said the present was not the fit moment. The Government had prepared a law, which the late terrible events need not hasten. The English Government, which was before the French in these matters, had inquired and examined, and had not yet found a solution. The question was grave and complicated, and should embrace steam-boats as well as railroads. Government would not lose sight of the question; but the interval of a session was not too much time to prepare it in. The subject then dropped, and the debate was resumed relative to the sums to be awarded for the execution of the lines already classed.

The Press.—The journal called the *Courrier des Théâtres* has been suppressed, and sentence passed on the editor by the Court of Police Correctionnelle to pay a fine of 10,000f. for declaring that the money deposited as security for any offence of which he might be guilty was not his own property. This decision appears to have alarmed the Opposition papers, particularly the *National*, which considered it a dangerous precedent, calculated to inflict a serious injury on any journal which might incur the displeasure of Government.

SPAIN.—Our intelligence from Madrid extends to the 4th inst., but is not of great importance. On the 29th ult. the Chamber resumed the debate on the 160,000,000 reals Loan Bill. The only feature of interest, however, in the discussion is presented in the speech of M. Arguelles, guardian of the Queen, who spoke at considerable length, and warmly advocated the cause of Ministers. "I have attentively watched their proceedings," he said, "from the commencement; and I have acquired a conviction that in no instance have they swerved from the principles set down in their programme, and I regard them consequently as entitled to my unlimited confidence. I cannot, then, in the presence of the pressing wants of the administration, withhold from it the trifling grant of 160,000,000, which it demands from the legislature. I never denied any administration the resources which it stood in need of to carry on the government. This want is particularly felt by the present cabinet, who has still to fulfil the obligations contracted towards the foreign legions. The *exposé* of those wants is too well justified not to convince me of the necessity of acceding to the demand. I will, moreover, grant to Ministers the supplies they may require for the expenditure occasioned by the events of Oct., and I will take their word for the amount. They told you that their principal motive in applying for 160,000.000 was to have always in reserve a sum of 50,000,000. This reason is perfectly just. If we may consider civil war as entirely at an end since the signal discomfiture of a rebellious prince, we cannot flatter ourselves to be altogether free from apprehensions of foreign war. You have no doubt all read with indignation a paragraph in the *Augsburg Gazette*, in which it is stated that the marriage of Queen Isabella II. could not be arranged in Madrid, the Five Powers having undertaken to provide a husband for her Majesty." M. Arguelles concluded by vindicating the Ministry against the charge of pusillanimity and indecision. On the following day the debate was resumed; and after a few words from Messrs. Cantero and Mendizabal, the proposition of two members of the Finance Committee, which authorised the government to issue Treasury bonds to the amount of 160,000,000 reals, was discussed; but from the number of amendments to the bill presented on that day, it was expected that the debate would last a fortnight longer. The Cabinet appeared determined not to reply to any questions put by the opposition until this bill should be voted by the Chamber. The period for the departure of the Infante Don Francisco de Paula was not yet fixed. Messrs. Onis and Alvear, who had been commissioned to bring back to Madrid his two sons, at present in Germany, were to set out in a few days. A banquet was given by the Queen to the Infante and family on the 1st inst. Great preparations had been made for celebrating the anniversary of the insurrection of the people of Madrid against the French, on the 2d May, 1808, and the municipality invited the families of the victims who perished in that insurrection to assist at the funeral ceremony, which passed off satisfactorily and without any disturbance. Accounts received from Barcelona of the 1st inst. inform us that some agitation prevailed in that city, in consequence of a tumultuous scene which had occurred at the theatre, where "seditious cries" had been uttered against the Regent. The military posts had been doubled, and other measures adopted to prevent disorders; but subsequent accounts received to the 4th inst. state that the tranquillity of the city had again been entirely restored.

PORTUGAL.—We have received intelligence from Lisbon to the 2d inst. The suspension of the negotiations for the commercial treaty had created much discontent at Oporto; fresh representations had been sent in to the Home-office, and Senhor Maya, the representative of the Commercial Association at Oporto, had been urgent in pressing upon the Duke of Palmella and government its speedy conclusion. It is stated that at a Council of Ministers, held on the 30th ult., the government concurred in expressing an anxious wish that both the projected treaties with England should be concluded without delay; and that the Duke of Palmella had informed them that he saw no reason whatever why both treaties should not be signed during the course of the present month—a result which appears to be anticipated as certain. At the same Council a project was submitted for the reconstruction of the Council of State upon a more effective and intelligible basis, and it is said that it will be assimilated in its operation in some respects to the British Privy Council, and in others to the *Conseil d'Etat* in France. A difference had arisen between Monsignor Cappaccini and the government with regard to the *personnel* of the dignitaries to be empowered to grant dispensations in cases of marriage within the prohibited degrees, and the negotiations were in consequence expected to be suspended until fresh instructions were received from Rome. The names of 23 new peers were under the consideration of the Queen and the Government. They were expected to be soon published, and it was thought that they would meet with general approbation. At the same Council of Ministers, an audience had been given to two travelling agents of the Anti-Slavery Society of London: the government assured those gentlemen of their desire to put down slavery within the Portuguese dominions by every means in their power. It appears that the principal reason why Baron Lagos's plan of conversion had been opposed by the Council of State was, that no adequate means were shown of providing for the necessary increase of expenditure it would occasion. The Duke of Palmella declared himself not satisfied, though at first considered favourable to the proposal, which was consequently postponed for further information. The 29th ult. had been kept as a holiday, being the day on which Don Pedro first decreed the charter. The Queen held a levee, and the officers of the Army and Navy dined together at the Naval Arsenal. The Commanders and some of the officers of the British and French ships were invited to the dinner; an illumination took place in the Rocco-square in the evening. It is stated that within six months there have been 50 failures at Oporto, and that even the English wine-houses there are beginning to feel seriously the depressed state of trade.

Germany.—The German papers are chiefly occupied with comments on the late visit of M. Pageot to Vienna, relative to some arrangement respecting the Queen of Spain's marriage, to which we have before referred. Alluding to the interview that took place on this subject between M. Pageot and Prince Metternich, the latter is stated to have declared—1st, that the northern Powers would not interfere with respect to the Queen of Spain's marriage until the favourable moment should arrive; 2ndly, that they would not interfere in the internal affairs of Spain, nor would they acknowledge the existing Government; 3rdly, that neither the French nor English Government could induce them to alter their determination. Accounts from Vienna of the 26th ult. announce that Count Senfft de Pilsach, the present Envoy Extraordinary and Minister Plenipotentiary of Austria in Holland, will probably succeed Prince Esterhazy as Austrian Ambassador in London.—Accounts from Berlin inform us that M. Pageot was shortly expected in that capital from Paris; and it was understood that the object of his mission is to present the renunciation by France of all pretensions to place a Prince of the house of Orleans on the throne of Spain; on condition, however, that one be chosen from either the Spanish or Italian branch of the Bourbon family. Having failed with the Cabinet of England, and, as above stated, with Prince Metternich, the support of M. Bulow, it is said, is now sought for. Private letters from Berlin of the 27th ult. state that a special committee had been instituted, in order to decide on the expediency of increasing the import duties on foreign raw and bar iron, and on cotton goods. The Prussian Consul-General in England, M. Bernhard Hebeler, had arrived in Berlin to be present at the deliberations. The iron-masters had petitioned the King to raise the duties on foreign irons; but it was believed that his Majesty would not accede to their prayer.—It is rumoured that the King of Bavaria intends to grant an amnesty to the persons arrested for political offences, and likewise to those who have fled to avoid punishment. The time when this act of clemency will be carried into effect is said to be the approaching marriage of his Royal Highness the Crown Prince.—The Cabinet of Munich has just issued an order prohibiting the homœopathic system of treatment in hospitals, prisons, and other establishments, until further and satisfactory information shall be procured as to its efficacy.—The marriage of the Hereditary Prince of Saxe-Coburg Gotha and Princess Alexandrine of Baden took place at Carlsruhe on the 3rd inst. Lord G. Lennox, who had arrived from England, charged by the Queen and Prince Albert with their felicitations to the Royal pair, was present at the ceremony.

Hamburgh.—The General Steam Navigation Company's packet Caledonia arrived in London on Tuesday, bringing the painful intelligence that a considerable portion of this great commercial city, including all the principal public buildings, and all the chief streets of business, had been destroyed by a fire, which broke out on Thursday morning, the 5th inst., and which was still raging at the time of the departure of the packet at three o'clock on Saturday afternoon. The following are the particulars of this melancholy event, as far as they can yet be gathered from the accounts received, which are necessarily of a hurried and confused character. The fire broke out on Thursday morning at one A. M., in the Deutsch-strasse, a street not above eight feet in width, with high houses on each side, and as water could not immediately be procured—the canals being dry, in consequence of a long prevalence of dry weather—the flames spread rapidly, and the whole of the narrow and crowded streets that form the heart of the city were soon on fire. The great canal seems to have checked the progress of the conflagration on the one side, and the canal which runs along the side of the butchers' shambles appears to have arrested it on the other; but towards the north no impediment intervened, and in the course of Friday all the streets around the Alster were laid in ashes. The conflagration continued throughout the whole of Friday night and Saturday, and had extended to 52 streets, 3 churches, and 4 prisons. It was computed that one-third of the city, principally the commercial district, had already been destroyed; a number of lives had also been lost: the exact number, however, could not be ascertained, but it was stated from 40 to 50. The Senate had ordered everybody to leave the town. Supplies of powder had been received; and some thousands of Hanoverian, Danish, and Prussian troops had marched into the city, and were destroying houses with powder and cannon, in hopes of arresting the conflagration. The scene presented by the burning city on Friday night is represented as awfully grand; and a writer from the spot states that the picture of the destruction of Nineveh can alone give a somewhat adequate idea of the fearful magnificence of the scene. The wind blowing a gale from the west, and the night being completely dark, rendered the picture dreadful in the extreme. One half of the population had left the place, and were seated in the surrounding villages and fields, and the utmost misery prevailed; while on all the roads leading away from the city were to be seen long lines of carriages, waggons, and carts, conveying the inhabitants and their furniture away. At the time of the Caledonia's leaving, St. Jacob's church was on fire, and a gale was blowing from the north-west, giving a new direction to the conflagration, which still continued unabated. All the principal hotels, situated on the Jungfernstieg, had been destroyed. It was attempted to save the goods from the large warehouses by putting them into barges on the canals: but in many instances the burning houses fell into the canals, and thus sunk the goods and filled up the canals. The fire-engines generally were worked until they had become disabled.—Accounts have since been received, brought by the Hull steamer, which left Hamburgh late on Sunday, stating that the fire had then been got under, and that no apprehensions were any longer entertained for what remained of the city. The number of lives lost, it was estimated, exceeded a hundred. We have since received by the steam-ship Countess of Lonsdale, which arrived in London on Thursday morning, accounts up to Tuesday, at which time the fire was completely got under. The papers thus brought give more detailed accounts of this serious calamity, but the main facts are as stated above. Among the public buildings entirely destroyed are the following:—Three of the five principal churches, namely, St. Peter's, St. Nicholas', and St. Jacob's; the old Exchange, the new one having escaped unhurt; the Bank; the Börsen Halle; the Senate House; the Eimbecksche House; the City Post-office; the four principal prisons or Houses of Correction; the waterworks of Mr. Smith; and nearly all the principal hotels and coffee-houses. The public school and city library are not spoken of in any of the accounts as having received injury, but as most of the adjoining streets are enumerated in the list published, it is feared that the school and library have shared in the general destruction. The fire originated in a tobacconist's shop in the Deutsch-strasse, and extended east and west to the Steinthor, embracing all the buildings from the Grassemarkt north and south to the Fischmarkt. Since the intelligence brought by the Caledonia, the whole of the town, from the Pferdemarkt to the Detention-house, has been burnt down. The houses being constructed to a great extent of wood, the inflammable nature of the materials rendered it very difficult to arrest the progress of the flames. Providentially the wind continued to blow in the same direction up till 2 p.m. on Sunday, when the fire was happily extinguished. Had the wind at all shifted to the north, it is thought that the whole of the houses on the Steinstrasse must have been consumed. It is said, that, acting upon the advice of Messrs. Giles, Thompson, and Linley, three British residents, the Senate had on Saturday afternoon given directions to the artillery to blow up the house of Mr. Solomon Imheine, opposite the Alster; and hence the new Jungfersteig, a quarter of the town most recently built, and where the most wealthy inhabitants resided, was preserved. The troops from Harburg, Lubeck, Luneburg, Gluckstadt, and Hanover, had been incessant in their endeavours, by demolishing buildings, &c., to cut off the progress of the flames. The English sailors belonging to the vessels had also given their assistance; and private letters state that, had they not been withdrawn, the fire would much sooner have been extinguished. Unfortunately, however, a rumour had been set afloat, attributing the fire to the agency of the English; and to such an extent did the feeling actuate the lower orders, that during Saturday afternoon and the whole of Sunday no Englishman could venture with safety to make his appearance in the streets; and the British Consul, with the harbour-master, thought it necessary to prohibit the English belonging to ships from leaving their vessels. In one instance an Englishman, on Saturday afternoon, being recognised, was rudely attacked and struck with a musket on the back of the head by one of the Burgher guard. No fewer than 15 Englishmen had been arrested on suspicion, but there being no grounds whatever to justify their detention, they had been discharged. The person named Cohen, in whose house the fire first broke out, had also been apprehended, and still remained in custody. It is believed that about 1,034 houses had been burnt down by the fire, and the whole extent of property destroyed is estimated at 7,000,000*l.* sterling. Our readers will be pleased to learn that the merchants of London have set the example of raising a subscription to relieve the immediate distress occasioned by this calamity—a prompt and spontaneous demonstration, which is honourable not only to the mercantile classes, but to Great Britain at large.

Hanover.—We learn by private letters, dated the 26th ult., that the Crown Prince is betrothed to the Princess Mary, eldest daughter of the Duke of Saxe-Altenburg, and not to the second daughter, Princess Theresa, as was reported in the German papers, and stated in our last. His Serene Highness the Duke of Saxe-Altenburg himself announced this fact to the members of the Assembly of the Estate, who met on the 25th ult., to keep the 25th anniversary of his Highness's marriage.

Belgium.—Private letters from Brussels, dated the 6th inst., state that a Mr. Bothori, who has just completed a carriage which moves alone without steam, by means of galvanism, and without horses, set out a week previously to fetch two millions in silver, which Baron Rothschild had promised him if he would bring them from Paris to Brussels with his carriage in 15 hours. He was expected on Sunday evening, the 8th inst. The expense of building the Palace of Justice at Ghent was originally estimated at 900,000 francs; but it appears that it amounts to nearly double that sum, viz. 1,653,119 francs. The Municipal Council at Ghent has decided that an application shall be made to the King and to the Provisional Council for an additional grant towards the expense of this building. Letters received at Antwerp announce that the commissioners sent from Bruges for the purpose of examining into the practicability of founding a colony in Brazil have arrived at Rio de Janeiro, and that they were favourably received by the Congress of Brazil, which seems disposed to grant the society all the concessions it desires.

Italy.—Accounts received from Venice state that the Emperor of Austria has ordered that a monument of Titian should be erected in that city, at a cost to the state of 230,000 florins, in the church in which the statue of Canova is placed.—Letters from Palermo of the 20th ult. state, that the King of Bavaria had arrived in that city, and set out on a tour through the interior of Sicily.—It is reported that the King of Sardinia has lately ordered the expulsion of the Jews from the town of Savona, within three days, and the re-union in one of the worst streets in Genoa of the Jewish population of that city.—Accounts received from Naples state that the post-office treaty between France and the Two Sicilies only waits for the King's signature, that the Duke of Montebello was about shortly to take it to Paris, that the ratifications would be exchanged in two months, and that it would be in full operation on the 1st Oct. The marriage of the King's sister, the Princess Therese, with the young Emperor of Brazil is regarded as concluded.—The papers speak seriously of disasters having been occasioned in Calabria Ultra by inundations. Bridges have been swept away, houses reduced to ruins, and several persons drowned. The telegraph at the Port of Dino was struck by the electric fluid, and almost destroyed, and the man stationed there killed.

Switzerland.—Intelligence from Geneva informs us that the Constituent Assembly was proceeding with the revision of its federal compact. The first article of the new constitution is in the following terms:—"The republic of Geneva constitutes, as a sovereign state, one of the cantons of the Swiss confederation. The sovereignty resides in the people, who exercise it within the limits established by the constitution. The form of government is a representative democracy." The Assembly proclaimed the equality of all citizens in the eye of the law, the liberty of the press, the abolition of the censorship, the freedom of education, universal suffrage, and the judgment by jury in criminal matters. Accounts from Zurich state that the elections had gone in favour of the Liberal Radical party, who had succeeded in returning 92 out of the 165 members of the Grand Council. Private letters from Basle, dated the 4th inst., mention a report that a note had been delivered from the Earl of Aberdeen to the President of the Swiss Confederation, recalling to mind the decisions of the Congress of Vienna on the subject of Switzerland, and recommending to the different States to observe the limits prescribed by the federal compact, and to abstain from disputes about religion.

Russia.—Accounts from St. Petersburgh inform us that the attention of the public is now almost absorbed by the approaching visit of the King of Prussia to that capital, and some anxiety is felt for the results in political respects. The journals state that an amnesty will be granted by the Emperor of Russia to the Polish political offenders in July next.

Turkey.—We have received by way of Vienna private letters from Constantinople dated the 20th ult., three days later than the advices brought by the last Levant mail. The negotiations for the settlement of the Greek question do not seem to make much progress, although the English and French Ministers were active in their diplomatic intercourse with the Porte. M. Pisani, the chief dragoman of the British embassy, had been suspended in his functions by Sir S. Canning. Mr. Alison replaced M. Pisani *ad interim*. The cause of the latter's suspension is said to be as follows:—After a conference with the Reis Effendi, on the question of the Lebanon, M. de Pisani had stated to the Ambassador that the Porte was willing to appoint a member of the family of Schachali to be Emir of the Lebanon. The Ambassador having demanded the accomplishment of this promise, the Reis Effendi replied, that he had subjected the promise to certain eventualities. M. de Pisani was thus compromised, and was dismissed. The friendly relations between Sir S. Canning and the Porte are stated to have been disturbed lately by various causes, but more particularly by the ill-treatment of British subjects. The Porte, it appears, had addressed a complaint to Baron de Bourqueney of the conduct of the French Consul in Damascus, who is accused of dispensing protection in a manner incompatible with the independence of the Ottoman local Administration. Baron de Bourqueney is said to have replied evasively.

United States.—By the arrival of the packet ship New York at Liverpool on Monday, and the Great Western steamer on Wednesday, we have papers to the 29th ult., 14 days later than those previously received. The Loan Bill had passed the Senate, and received the signature of the President. Lord Ashburton was engaged in the business of his mission. He had dined with the President, and the Prussian Ambassador; and was engaged to dine with the Secretary of State and other distinguished gentlemen. The papers do not contain any authentic intelligence respecting the negotiations between his Lordship and the Government. It however appears from them that public feeling was becoming much more pacific, not only upon the north-eastern boundary question, but also upon the important one of the "right of search," respecting which matters are represented as being in a fair way of satisfactory arrangement. Another serious steam-boat explosion has occurred at Baltimore, the most fatal in its consequences ever known in that part of the United States. The vessel was a new one, and engaged in her first trip, which was a pleasure excursion, having her decks crowded with passengers. By some accident the boiler suddenly burst, whereby she became a perfect wreck, and sunk almost immediately. The loss of life was very great; the exact number, however, had not been ascertained at the time of the packet's leaving, but upwards of 30 dead bodies had been picked up.

West Indies.—The West India Steam Company's ship Clyde arrived at Falmouth on Sunday, bringing mails from Havannah to the 15th, Nassau 17th, and Bermuda 23d ult., and Fayal 2d inst. The affair of the slave-ship Creole was settled the day previous to the

Clyde quitting Nassau, the blacks having been discharged by a proclamation from Judge Symonds, notwithstanding the American consul, Mr. Darling, pressed for further delay. The prospects of the crops in Jamaica and Trinidad were favourable; and it was expected that, should the gathering prove propitious, they will give a good return to the planter. At Demerara, the dispute between the labourers and their masters was not adjusted at the latest dates The irregularity of the Royal West India steamers was a prominent topic of discussion among the mercantile interest of Jamaica, who call for a Government investigation into the manner in which the communication between the two countries has been delayed. The Clyde during the period of her absence from England, a few months, has consumed no less than 3,800 tons of coal.

Mexico.—Private letters received by the Clyde from Mexico state that no actual invasion of Texas has taken place, although there have been a few skirmishes on the frontier. The country is described as tranquil, and Santa Anna is said to be very popular: The new tariff was expected to make its appearance in a few days, reducing the duty on dry goods one-fourth, and on wines and other liquors one-half. This measure was expected to confer great benefit on trade, and by lessening the inducement to smuggle, to prove of considerable advantage to the revenue.

Australia.—We have received papers from Hobart Town and Launceston to the beginning of January. The substance of the news brought by them is, that the market prices of provisions were maintained by the expectation that the crops would suffer from a drought which was then prevalent in the interior. Several of the districts had already received damage by the blight and rust. Accounts from Sydney state that one or two failures had occurred in that town, but the names are not mentioned. Business, which in all branches was bad, was expected to improve as the year advanced. The banks appear to charge high rates of interest for loans, which is complained of in all parts of the colony.

Parliament.

HOUSE OF LORDS.

Monday.—After the presentation of petitions, Earl De Grey announced that Mr. Biddulph had been dismissed from the magistracy of Ireland, in consequence of that gentleman having admitted during a recent trial in which he was the prosecutor, that he had conveyed advice to the prisoners, who were charged with having made an attempt on his life by firing at him, to fly the country, and escape from justice.

The Marquis of Normanby, after animadverting on the remissness which he said had been manifested by the Irish Government in not dismissing Mr. Biddulph earlier, moved for the production of the correspondence which had passed between that gentleman and the Government on this subject.

Earl De Grey said he had no objection to the production of the documents referred to, and would only add that the moment he became aware of the case of Mr. Biddulph, he acted upon it in that way which he considered the justice of the case to require.

The Exchequer Bills Bill was then read a second time; the Parish Property Bill was read a third time; and the Kensington and Knightsbridge Openings Bill, and several private Bills, were read a second time. A message from the Commons brought up the Copyright Bill, which was read a first time. The Lord Chancellor said he should move that the Bill be read a second time on Tuesday, and the discussion taken on going into committee.

The Marquis of Normanby then brought forward the subject of a complaint from the magistrates of Sunderland, respecting a charge made against them by the Marquis of Londonderry, Lord Lieutenant of the county of Durham. The charge was, that the noble Lord had in his place in Parliament stated, "that the late Government appointed ten magistrates in Sunderland, all of whom were Whigs; and the consequence was, that at the last election they refused a license to every individual who would not vote in accordance with their principles." The Marquis of Normanby stated that a meeting of the magistrates had been held, at which resolutions were passed, a copy of which had been sent to the Marquis of Londonderry, contradicting the above statement, and expressing a hope that his Lordship would, in his place in Parliament, correct the erroneous statement he had made. Lord Normanby concluded by asking whether the noble Marquis was disposed to retract or adhere to the accusation which he had made. The noble Lord in the course of his observations reflected on Government for having appointed the Marquis of Londonderry Lord Lieutenant of the county of Durham.

The Marquis of Londonderry entered into a long explanation of the circumstances of the case; adding, that he had nothing to retract, and that it was still his impression, from what was within his own knowledge, and from information he had received, that the magistrates of Sunderland, like other magistrates in many other counties, used their power of granting licenses for purposes of political partisanship.

The Duke of Wellington closed the discussion by defending the conduct of the Marquis of Londonderry, who, he thought, was quite right in not volunteering to come forward on the subject of the letter, when he received it; and if his noble friend had so come forward, he would have made himself instrumental to a breach of the privileges of the House. His Grace added, that he thought one of the topics of the noble Marquis (Lord Normanby) might as well have been omitted, namely, a reflection on Government for having appointed his noble friend Lord-Lieutenant of the county of Durham. Now, his noble friend was the head of one of the greatest properties in the county; he had rendered services to the county of Durham; he had liberally expended a large sum of money in making a harbour in that county; and he did think that the attack of the noble Marquis upon Government for selecting his noble friend to fill this office in the county of Durham, which was vacant—founding his attack upon this, that his noble friend had thought proper to resign the office of Ambassador to St. Petersburgh, because he had not the confidence of the House of Commons in that office—was not quite fair and proper. His Grace concluded by expressing his belief that, in all the county, there was not an individual upon whom the appointment could have been more properly conferred than his noble friend.

Tuesday.—Lord Brougham, in moving the second reading of his Bill for granting indemnity to the witnesses examined before select committees, defended himself, and their Lordships generally, from the imputation which had been cast upon them, of giving indirect encouragement, or at least impunity, to bribery, by having thrown out the bill which had been sent up to them by the Commons in the month of June last. He contended that the measure, so far from operating as a check upon bribery and other corrupt practices, took the most effectual means for promoting them, by insuring an absolute exemption from punishment of any party, however guilty, who could place himself in the position of a witness. It was in many other respects so objectionable, that he considered it the most absurd piece of legislation which had ever been sent up to them from the other House; and as, from the late period at which it reached them, no time was left for amendment, their Lordships had no course open but to reject the bill.

Upon the motion for the second reading of the present bill, Lord Wicklow complained that no notice had been given, and in conformity with a suggestion from the Lord Chancellor, it was decided that it should be read a second time at the early sitting on Wednesday.

Some conversation afterwards took place upon a motion by Lord Clifford of Chudleigh, for a committee to inquire into the treatment of certain Roman Catholics in India; but the motion, after a few remarks from Lord Fitzgerald, was withdrawn.

Thursday.—The Duke of Wellington gave notice that he should on Friday move that the House, at its rising, do adjourn till the Friday following.

The Dublin Police Bill was read a second time, and ordered to be committed.—The Exchequer Bills Bill, the Victoria Park Bill, the Knightsbridge and Kensington Openings Bill, and the Kingsclere Inclosure Bill, were severally read a third time and passed.

Several petitions were then presented; among others one by the Earl of Winchelsea, from Maidstone, against the reduction of duty on the importation of foreign hops.

Earl Fitzwilliam took the opportunity to say that a few nights previous a conversation had taken place in that House respecting the employment of persons in mines. His noble friend (the Earl of Winchelsea) then expressed great anxiety concerning the morals of that part of the population, which, he said, were seriously injured by the employment of females and children in mines. Now, as his noble friend was so exceedingly desirous of protecting the morals of the inhabitants in the manufacturing districts, he would recommend him to look a little more to the morals of the persons in the districts with which he was himself more immediately connected. He was of opinion that the hop-pickers, who annually visit the county of Kent, served greatly to contaminate the morals of the people of that county.

The Earl of Winchelsea said that it was true that hop-grounds might be converted to other purposes of cultivation than that of the production of hops; but the mischief to be apprehended from the admission of foreign hops at a low rate of duty was not limited to hop grounds and hop-growers; it extended to woodlands, and to that class of persons who had invested large sums of money in the growth of ash, willow, and chestnut poles for the use of hop-grounds. Throw the land out of the cultivation of hops, and these woodlands, which were of great extent, would immediately become valueless. The land hitherto devoted to the growth of hops might be easily convertible to other purposes; but the woodlands could not be brought into a state fit for cultivation except at an expense equal to the fee-simple of the land itself. The noble Earl had recommended him to look to the morals of the population in his own immediate neighbourhood. He begged to state that there was no district in that neighbourhood in which schools were not established capable of affording education to the whole of the population. All he asked was, that the hop-grower should have a fair protection, such as was given to other classes.—A desultory conversation followed, which led to no result, and the subject dropped.

The Marquis of Lansdowne moved for certain returns relating to the exemption of that portion of the funded debt of Great Britain which was held by foreigners from the Income-tax; and took this occasion to contend, by an appeal to argument and authority, against the justice and expediency of subjecting foreigners to such an impost.

The Earl of Ripon insisted that the exemption in the Acts referred to were founded on expediency, in reference to the peculiar circumstances of that time, and denied that there was any injustice in subjecting foreigners, equally with her Majesty's subjects, to an impost which was calculated to promote the interests of both by upholding the value of their property.

Lord Monteagle referred to the amount of British property in foreign funds as a ground of objection to any interference with the property held by foreigners in our own, and regarded the former cases of exemption referred to by his noble friend as precedents which ought to be strictly adhered to, inasmuch as they must have supplied an inducement to foreigners to embark their capital in our national securities.

Lord Brougham thought that it would be exceedingly unwise to extend the property-tax to foreigners, and that it would be highly inexpedient, for the sake of the trifling sum which could be obtained from foreigners by means of this tax, to give a pretext to other countries to deal in a similar way with funds of ours which were under their control. He thought, unless the justice of it was so manifest that no argument against it could be adduced, it would be exceedingly impolitic, especially when he considered how much larger was the stake of this country in foreign funds than the stake of foreigners in English funds.

The Earl of Wicklow did not perceive any injustice in the tax applied to foreigners, and apprehended that their exception would open a door to fraud.—The Duke of Newcastle disapproved of the entire measure, as well as of the commercial alterations for the sake of which it had been proposed.

Viscount Melbourne said, that so far as regarded the point of justice, he must own that, as foreigners had placed their capital in British funds, it was a very fair question, whether they might not be taxed in return for the protection they received? But it should be remembered that they received the advantage of protection in respect of that particular property alone, and not that general protection and advantage which a native of the country enjoyed; and yet they were to be called upon for the full amount of taxation. But with respect to the wisdom, policy, and expediency of imposing this duty upon foreigners, that was a widely different question; and his opinion was, that it was in the highest degree impolitic and inexpedient.

Lord Wharncliffe said that the different circumstances of the present time justified the deviations from the precedents referred to. The argument derived from the amount of British capital in foreign funds had little weight with him. If Englishmen invested their money abroad, they must take their chance.

On the motion of Lord Brougham, the Bribery at Elections Bill, after some discussion, was committed and reported without amendments.

Friday.—The Royal Assent was given by commission to numerous public and private bills, of which the most important are the Exchequer-bills Bill, the Victoria Park Bill, the Knightsbridge Opening Bill, the Soap Duties Bill, and the Bills relating to the Derby and Great Junction Railway, the Bolton and Preston, the Stanhope and Tyne; the Sheffield, Ashton-under-Line and Manchester Railway Act Amendment; the Great North of England and Hartlepool Railway Act Amendment; the Glasgow, Paisley, and Ayr Railway Act Amendment; and the Cheltenham and Great Western Union Bill. The House then adjourned for a week.

HOUSE OF COMMONS.

Monday.—The following Bills were read a second time, and ordered to be committed:—the Boston Harbour Bill, the London Bridge Approaches and Royal Exchange Avenues Bill, the Market Harborough and Brampton Roads Bill, the Metropolitan Wood Paving Company Bill, the London and Greenwich Railway Bill (No 3), the York Cathedral Bill, the Imperial Bank of England Bill, the Ely-Place Improvement Bill, the Clerkenwell Imprisonment Bill, the Britwell Inclosure Bill, and Batso Naturalisation Bill.

Mr. Roebuck moved the order of the day for the adjourned debate on the question of appointing a committee to investigate certain cases of alleged bribery in the election of Members of Parliament, and presented a petition from Reading, confirmatory of the statements with respect to the proceedings and supposed compromise in the case of the sitting members of that borough.

Major Beresford declared his anxiety, for the sake of his own character, that the committee should be appointed, and that its inquiry should be a searching one. He would willingly answer to a proper authority, though he had declined answering the learned mover of the present resolution. Mr. Roebuck, he said, had alluded to "rumours being abroad." There were rumours abroad—rumours that Mr. Roebuck himself had been returned without the requisite qualification, and that the present proceedings were the result, not of patriotism, but of private ill-feeling.—Mr. Wynn said, there was no precedent for such a committee. The regular course would be, for the hon. Member to bring forward a specific charge on each case, and for the House thereupon to determine what proceeding they would adopt with reference to it, but not to appoint a fishing committee.—Mr. Ward thought that, after the allegations which had been made, the House was bound to go into the inquiry. After a few observations from Sir R. Inglis, who opposed the motion, and from Mr. R. Yorke in support of it,

Lord Palmerston expressed his surprise at the silence of Ministers. Doubtless they had their reasons; he would explain his own. He could not vote for this motion. It was not a motion for a general inquiry into the extent of bribery at the late election, but into the grounds of particular compromises. He was not aware that these compromises were violations of the privileges of Parliament, and the inquiry, therefore, could not lead to the punishment of the parties concerned. He was, however, ready to concur in a strong measure for putting down this wholesale corruption. The noble Lord concluded by saying that either the now proposed inquiry should be as extensive as the evil, or it should not take place at all. The only other remedy suggested was the ballot, but that would only introduce worse evils of another kind. If anything could ever induce him to support the ballot, it would be a refusal on the part of Ministers to concur in an effectual law against bribery.

Sir R. Peel was not aware that this was so decidedly a party question as to have made it incumbent on the Minister to declare himself at the commencement of the debate; nor would any refusal of Government to concur in any particular measure of legislation very well justify the noble Lord in voting for that ballot which he had declared to be a remedy worse than the disease. As to these particular charges, he did not think them definite enough to warrant the proposed inquiry. If, however, a charge of corruption were put upon record, he thought it ought not to go unexamined. The mere want of power to examine on oath was not a sufficient bar; and if the present charges should be reduced into a definite form, showing *primâ facie* a gross breach of privilege, he thought it would be for the honour of the House not to leave the matter uninvestigated, but to refer it to a committee, armed with the ordinary constitutional powers.

Lord J. Russell thought that Mr. Roebuck should have introduced a specific measure similar to what he himself had sent up to the House of Lords in 1841; and if he obtained the sanction of Government to such a measure, there would be no doubt of its success. He would himself be willing to bring in such a measure if Sir R. Peel would give him his support and that of his Government; but he would prefer Sir R. Peel's doing so on his own responsibility.

After a few remarks from Mr. M. J. O'Connell, who stated his intention to vote for the motion,

Sir R. Peel explained as to what Lord John had suggested about a legislative measure. He could only say that he would concur in forwarding such a bill if framed by the noble Lord, who had more leisure than he had; he himself could not find the time necessary for that mature consideration which the framing of it by Government would require.

Mr. Hume supported the motion.—Mr. Lindsay, though regretting to differ from Mr. Wynn and Sir R. Peel, felt that the character of the House demanded this inquiry.—Mr. Muntz was of the same opinion; as was also Mr. Plumptre.

Lord Stanley said, the objection to Mr. Roebuck's motion was, that the charges were brought as breaches of privilege, but without enough of specification to show whether they actually were such. The inquiry proposed by Mr. Roebuck was not into the extent of the bribery, but into the legality of the compromise; and before he could accede to the proposal of a committee, there ought to be some specific question for that committee to deal with and be confined to. He was as anxious as any man for the suppression of bribery, but he feared that such a committee as Mr. Roebuck asked for would mix up private objects with public ones to a dangerous extent.

Mr. Sheil said, the member for Bath was specific enough in his charges; it was only in the frame of his motion that he was too vague; but the motion might be amended. He wished for an inquiry, not in order to indulge in the bad luxury of giving pain to individuals, but for the sake of the public.—Mr. Roebuck replied. He vindicated his motion from the imputation of vagueness, and himself from the charge of asperity. He wished to avoid all personal charges so far as he could, for his object was to brand the system. On one hand, he said, his charge was called too wide; on the other it was complained of as not sufficiently comprehensive. He would, however, amend his motion, and make it specific and distinct; and if the House would grant him his committee of inquiry into the specific allegations, he would engage to bring in a bill of indemnity for all who would be implicated.—After a desultory conversation as to the terms of the motion, it was finally carried without a division in the following terms: "That the House having been informed by one of its Members that he had heard, and believed, that in the case of the election petitions presented to try the returns from Nottingham, Harwich, Lewes, Bedford, and Falmouth, certain corrupt compromises had been entered into for the purpose of avoiding investigation into the alleged bribery committed in those cases, a select committee be appointed to ascertain and report whether such compromises and such alleged bribery had taken place or not."

The order of the day was then read for the bringing up of the report on the Income Tax Bill, which was agreed to.—Mr. B. Wood proposed a clause for enabling a party assessable under more schedules than one to set off losses sustained under one or more of them against profits made under other or others of them, so that the payment should be only on the balance of total income.

The Chancellor of the Exchequer opposed the clause, on the ground that it would open a door to evasion, and tend to defeat the object of the bill.—After a short debate, the clause was rejected by 110 to 66.—Mr. Gill moved a number of amendments and clauses "with a view to capitalise all incomes not derived from landed or funded property, and to charge five per cent. on such capital as the groundwork of the property tax." He would take the sense of the House on the first amendment, as determining the entire series.

Mr. Goulburn opposed this clause as at variance with the whole principle of the bill, which professed to tax income, and not mere capital. The clause was supported by Mr. Hume and Mr. Howard. The House divided, and the clause was rejected by 183 to 36.—Mr. Goulburn introduced some words, giving the exemptions enjoyed by cathedrals, colleges, &c., to ALL places used solely for Divine worship; which addition was adopted.

Sir R. Inglis again pressed on the consideration of Government (and requested that Sir R. Peel would notice on the third reading) his suggestion for exempting incomes above 150*l.* a-year from the per-centage on the first 150*l.* of their amount.

Sir R. Peel undertook to give on the third reading an explanation of the reasons which precluded the adoption of that suggestion.—Various verbal amendments were made, and the report being gone through, the third reading was appointed for Friday, subject to further postponement in case the Tariff should not then have made sufficient progress.

On the motion of Lord Stanley, the Australia and New Zealand Bill passed through committee.—The other orders of the day were then disposed of.

Tuesday.—After the presentation of petitions, Lord J. Stuart brought forward a motion for the consideration of the Lords' amendments in the Glasgow, Paisley, and Kilmarnock Railway Bill.—Sir J. Easthope moved an amendment that the Bill be re-committed to the former committee.—The House divided, when

there appeared for the amendment, 54; for the original motion, 15; majority, 39. The Bill was consequently recommitted.

The Lords' amendments to the following Bills were agreed to, and the Bills passed:—the Glasgow and Redburn Bridge Road Bill, the Cottenham Drainage Bill, the Buckland Enclosure Bill.

Mr. P. Howard moved a new writ for Nottingham, in consequence of the retirement of Sir G. Larpent.—Mr. Roebuck opposed the issuing of the writ, on the ground of the inquiry which had been ordered.—After some observations from Mr. Godson in favour of the issue, and from Mr. Ward against it, Sir R. Peel said, that as the House had directed an inquiry, it would be an inconsistency to order a new writ forthwith. But he thought the delay ought to be as short as possible.—Sir R. Inglis did not think there were sufficient grounds for the suspension; Mr. Wynn was of opinion there were, and thought the committee of inquiry should go into the case of Nottingham first.—Mr. C. Wood took the same view.—Col. Sibthorp was for issuing the writ He did not care for the suspicions of the Member for Bath.—Mr. James opposed the writ.—Several Members addressed the House, and strangers were ordered to withdraw for a division; but Mr. P. Howard said he would not press it to a division, his only object being to protest against any interference with the freedom of representation.

Mr. Redington moved for leave to bring in a bill excluding Sudbury from the franchise of returning Members to Parliament. He stated, from the printed report, the outline of the gross corruption which prevailed in this borough at the late election. After a few words from Col. Rushbrooke against confounding the innocent with the guilty part of the constituency, leave was given to bring in the bill.

Sir R. Peel then rose to make his general statement on the Tariff, previously to the House going into committee on the subject. After some introductory observations, he proceeded to the subject of the change in our Customs Acts, and its influence on commerce and trade, involved in the Tariff. The delay, he said, had been productive of some advantage; there had been time for consideration, and while a fair hearing had been given to all, no undue influence had been permitted to operate on Government. The great objects of himself and his colleagues had been to abolish prohibition, by reducing prohibitory duties; and to reduce the duties on raw materials, and on materials partly manufactured. He still entertained that confident belief and expectation which he had expressed on first intimating the intentions of Government as to this Tariff, that the general result of it would be, if adopted by the House, materially to diminish the charge of living. Thus the proposed reductions on the importation of clover, onion, and other seeds, would be beneficial to agriculture; on mahogany and other foreign woods, chiefly for making furniture, in the manufacture of which our artisans were pre-eminently skilled, the reductions of duty would be beneficial to the community at large; and the reductions on ores and metals, as on smelted copper, would have a powerful influence on our steam and other mercantile navy, in lowering the cost of production, and enabling us to compete with foreign ship builders. After alluding to other articles in the new Tariff, the reduction on which he considered would greatly benefit our commerce, Sir R. Peel proceeded to notice the proposed permission to import live animals, meat, fish, and other articles of consumption, either prohibited altogether, or on which high duties were now levied, and said he was satisfied that, while no injury would result to any particular interest by the proposed change, it would be beneficial, especially to the humbler classes of society. Thus salt provisions, which had been hitherto under a total prohibition, would, under the new system, be admitted at a duty of about a penny a pound. So, as to live animals. And so likewise as to fish, particularly the fish in which the poor were most interested—namely, herrings. The Irish peasant now paid 20*s.* per barrel; henceforth he would get that barrel from Norway for 10*s.*; or would procure herrings off his own coast by means of that improved craft which the reduced duty on timber would enable him to obtain there. The duties were also to be reduced on the importation of potatoes, rice, and hops; on the last of which articles the reduction of duty would be from 8*l.* 11*s.* to 4*l.* 10*s.* He trusted, therefore, that a full disposition had been proved on the part of Government to lower the prices of those articles of food which are principally consumed by the poor. The right hon. Baronet then argued at considerable length that the imposition of high duties on foreign manufactured articles afforded little, if any, real protection to the home producer. He then proceeded to vindicate the tariff generally on the higher ground of justice and national interest, alluding to the unnecessary alarms which had been excited amongst the agricultural interest with respect to the effect which the importation of foreign cattle would produce. He did not mean to say that there would be *no* reduction in the price of cattle: there would be *some*; and some there ought to be, for the price of meat in England was now too high. But viewing the Continental area from which cattle could be imported, compared with the demand, there was no ground for alarm; nay, an importation of lean cattle would be absolutely beneficial to the English grazier, while various statements were produced to show that the expectation of a large importation of fat cattle was delusive. Indeed, he did not despair of seeing this country an exporting one, through the more improved application of its capital and skill. On the whole, he said that the fullest communication and consideration had strongly confirmed Government in their intentions as to the duty upon cattle He would not revive the discussion on the corn question—that he considered as decided by Parliament; but, at the proper time, he was prepared to state the reasons why Government did not consider the general principles of free trade, which they fully admitted as applicable to the present state of the sugar and timber questions. Sir R. Peel concluded a speech of great length, by saying that he regretted that other nations had not entered into the views of himself and his colleagues, and he had reserved some subjects for arrangement with them; but, let them take what course they might, it would still be our interest to buy cheap and sell dear. The day would come when those nations also would see their interest; their perseverance in high duties would be met by that inevitable corrective, the smuggler; and the example of England, contrasted with that of states pursuing opposite principles, could hardly fail of ultimate effect and of reciprocal benefit.

Mr. Labouchere observed that the chief part of Sir R. Peel's speech had been addressed rather to his supporters than to his opponents. The principles of it were those on which the late Government had intended to act; he only regretted that any party struggle should have prevented the country from obtaining the benefit of them sooner. The essential difference between the schemes of the late and present Governments consisted in the omission of the sugar duties and the mode of treating the Corn-laws; apart from this, he admitted the value and importance of Sir R. Peel's propositions, and did not intend, in the committee, to carp at the details of the measure in those matters whereupon he might concur in the main view of the Government.—Mr. D'Israeli traced the history of commercial reform, with the view of showing that the Whigs were not peculiarly entitled to claim all the merit of it.—Mr. Hume expressed his satisfaction to find that free-trade principles were to be the order of the day, without much caring whether they were Whig or Tory.

Mr. Gladstone denied the imputation that there had been any change in the sentiments of his own party, or that there was any just claim to exclusive liberality on the part of the late Ministers.

Mr. E. B. Roche and Mr. G. Palmer made a few remarks in opposition to the measure; and Col. Sibthorp said that he disapproved of several points of the tariff, and cautioned Sir R. Peel against being too much captivated by the charming eloquence of gentlemen opposite, particularly of the Member for Montrose.

On the question that the Speaker should leave the chair, for the purpose of going into Committee, Major Vivian moved for some information, which he understood to have been supplied to Government by Mr. Meek, respecting the importation of salt provisions and other articles, and which Major Vivian suggested that Government withheld through fear of alienating their agricultural supporters.—Lord Worsley seconded the motion, which was opposed by Mr. Gladstone.—After a few words from Mr. Attwood, in support of it,

Sir R. Peel repeated the statement made by him in the earlier part of the afternoon, respecting the gradual advance in the price of butcher's meat. As to these papers, there must have been somewhere a gross breach of confidence. Everything material had, in fact, been given to the public; but certain names and certain confidential passages respecting the mode of making contracts had not been, and ought not to be, printed.

Lord J. Russell admitted the fitness of withholding names; but as to any passages touching the price of meat, there seemed no reason for their non-production. They appeared to contain only statistical information, which could be no secret.—After a warm discussion, in which several Members joined, the House divided, when there appeared—For Major Vivian's motion, 152; against it, 219; Majority, 67.

The House then went into committee on the Customs duties, and after some conversation as to the arrangement of the further proceedings upon the Tariff and Income-tax Bills, resumed, and the other orders of the day were disposed of.

Wednesday.—The Yarmouth and Norwich Railway Bill was read a third time, and passed. The amendments on the Drogheda Harbour Bill were further considered and agreed to.

Some conversation then arose respecting the time of appointing the committee of inquiry into election compromises; and Mr. T. Duncombe gave notice that on the nomination of that committee, which was finally fixed for Friday, he should move, by way of amendment, that a test be administered to its members.

Sir J. Graham then rose, and, pursuant to notice, asked leave to bring in a bill for the continuation and amendment of the Poor Law. The Commission, he said, had been prolonged by Act of Parliament until the 31st July; and Government now intended to propose that it should be further continued for five years from that day and until the end of the session succeeding. In support of the principle of the commission he cited a speech of Lord Brougham, purporting that the variety of the cases to be administered required a discretionary power somewhere. He himself believed that the same necessity existed now which existed when the Commission was constituted. The Duke of Wellington, he said, had also expressed his concurrence in Lord Brougham's opinion when the measure was first adopted; and he himself saw nothing in the experience of the bill which should induce him to change his own persuasion of its necessity. He believed that the board as now composed was such as to possess and to deserve general confidence. The number of its members had varied; at present there were ten; but he proposed to ask henceforth for only nine, the experience now acquired having increased the facility of transacting the business. On the subject of out-door relief he said there had been much misapprehension. In only very few of the manufacturing districts had it been absolutely prohibited. Upwards of one million persons had received relief during the last year; and more than half of these had received it at their own homes. It was intended to abolish by this bill the Gilbert Unions. He believed the existing act had intended to do so; but as there seemed to be some ambiguity, he now proposed to effect such abolition in express terms, the principle of those unions being wholly inconsistent with the principle of the general Poor Law. The Gilbert principle was to relieve the able-bodied at their homes, and the infirm in the workhouses; whereas the principle of the general law was to relieve the infirm at their homes, and apply the workhouse test to the able-bodied. It was also proposed by the new bill to prevent the enlargement of unions already containing 20,000 persons; but to allow combinations of parishes for the purpose of district schools within such short distances as would leave the children easily visitable by their parents or friends, and with such regulations as should allow the access of the ministers of all religious denominations. Local committees would be appointed in large unions for those parts of them which should be inconveniently remote from the place of the guardians' meeting. Poor persons, having been long resident in any parish far distant from their places of settlement, would in cases of sickness be relieved without incurring the liability to be removed as persons chargeable. With respect to bastardy, a remedy against the putative father not maintaining his child would be given in the shape of imprisonment for a term not exceeding three months. These were the main outlines of the bill; and he assured the House he would not have undertaken the responsibility of it, had he not been persuaded that it would conduce, not only to the comfort of the sick, aged, and infirm, but to the advancement of honest industry, and the increase of its just remuneration.

A short conversation then followed; several members, including Mr. T. Duncombe, Mr. Wakley, and Capt. Pechell, declaring strong hostility to the bill. Leave was given to bring in the bill, and shortly afterwards it was brought in and read a first time.—The Copyright of Designs Bill then passed through committee, and was reported.

Thursday.—There being only 34 members present at 4 o'clock the House adjourned till Friday.

Friday.—The Speaker announced that the petition against the return for Stafford had been abandoned.—Sir R. Peel stated that Government had demanded redress and satisfaction for the seizure of British officers on the coast of Syria, and that a communication had been made to the Sultan on the propriety of removing the Pacha of Syria.—A division took place on a motion by Mr. T. Duncombe, for the adoption of a form of declaration to be used by members of the Election Committee on the alleged compromises of petitions; when the motion was negatived by a majority of 143. Lord Howick moved a resolution against the preference shown to the colonies over foreign States in respect to duties on importation into Great Britain; it was opposed by Lord Stanley, Sir R. Peel, and Mr. Gladstone, and supported by Lord J. Russell and others; and was negatived on a division by a majority of 173. The House then adjourned until Friday.

CITY.

Money Market, Friday.—Consols for money and account closed 92½ to ⅝. Three per Cents. Reduced, 91½; Three-and-a-half per Cents. Reduced, 99¾; New Three-and-a-half per Cents., 101; Long Annuities, 12½; India Stock, 249 to 251; Bank Stock, 167½ to 168½; and Exchequer-bills, 39s. to 41s. premium.

Metropolis and its Vicinity.

Her Majesty's Fancy Ball.—On Thursday her Majesty gave a Fancy Ball at Buckingham Palace, the announcement of which has for some time past excited considerable interest in the fashionable circles. Upwards of two thousand invitations were issued, and the distinguished guests included all the members of the Royal Family, the Foreign Ambassadors, the Ministers, and the *elite* of the nobility and gentry of the country. The costumes worn on this occasion were splendid and picturesque, many of them being strictly historical. The most striking were those of her Majesty and Prince Albert, and the different quadrilles of France, Germany, Spain, Italy, and Scotland. The company began to assemble in the lower suite of rooms at 10; and shortly after having been marshalled, they passed in procession into the presence of her Majesty and Prince Albert, who were attended by the principal ladies and officers of the Court in magnificent costumes. The Marquis of Normanby, the Earl of Warwick, and several officers of the Queen's household, appeared in suits of armour. The entire suite of state rooms were opened, and brilliantly illuminated with chandeliers, candelabra, and branches. The company danced in the throne-room and ball-room, in both of which quadrille bands were stationed. The whole scene, from the richness and novelty of the different costumes, was extremely brilliant, and it is said to have surpassed anything of the kind ever given before in this or any other country. The Morning Papers have been much occupied with lengthened descriptions of the different dresses and costumes, but our space will not admit of our giving at any length the report of this brilliant fête: it may, however, be interesting to our readers to peruse the following description of the dresses worn by the Queen and Prince Albert. Her Majesty, who appeared in the character of Queen Philippa, wore a robe of gold and silver brocade, over which from the shoulders hung a mantle of the same material as that of which Prince Albert's robe (more minutely described below) was composed. Her Majesty's display of jewels was of great value; and from the upper part of her robe was suspended a description of pendant stomacher, said to be worth 60,000*l.* Prince Albert appeared in the character of Edward the Third. His Royal Highness's cloak was composed of rich scarlet velvet, which, as well as every other external part of the attire of his Royal Highness and of her Majesty, was expressly manufactured in Spitalfields, lined throughout with ermine of the first quality. Round the extremity ran a gold lace, three inches in width, bearing upon it a raised pattern of oak leaves and acorns. This lace was edged top and bottom with two rows of pearls of an unusual size, amounting in number to no less than 1,200. The cloak was cut so as to fix itself in such a manner as to hang pendant from each shoulder without any fastening; the two sides, however, were connected across the breast with a band composed of diamonds, emeralds, rubies, topazes, and almost every other description of precious stones. Underneath this cloak his Royal Highness wore a full robe, reaching from the throat to the feet, constructed of a material which in its manufacture cost 15 guineas per yard. It was a brocade, of which the component parts were gold and blue satin and silk. From the knee downwards it was slashed with blue velvet, studded with diamonds, rubies, emeralds, &c.: the collar of the robe was also studded with jewels. The Earl of Pembroke, who personated the Count d'Angoulême, afterwards Francis the First, wore a brilliant in his cap said to be worth 10,000*l.*; and the Duchess of Sutherland displayed jewels to the value of 100,000*l.* The following is a list of the several quadrilles, with their distinguished leaders:—The French Quadrilles, led by her Royal Highness the Duchess of Cambridge, as Anne of Bretagne, attended by the Duke of Beaufort, in the character of Louis XII.; Spanish Quadrilles, led by the Duchess of Beaufort; German Quadrille, led by the Duchess of Sutherland; Quadrille of the Crusaders, led by the Marchioness of Londonderry; Waverley Quadrille, led by the Countess De la Warr, in the costume of Isabella, Lady De la Warr, daughter of the Lord High Treasurer to Charles I., from a picture by Vandyke; Scotch Quadrille, led by the Duchess of Buccleuch; Cossack Quadrille, led by the Russian Ambassadress; Greek Quadrille, led by the Duchess of Leinster. After which followed a numerous miscellaneous list, not included in the list of quadrilles, among which were the Duke of Sussex, in Highland costume; the Countess of Jersey, in Italian costume; the Duke of St. Albans, as Grand Falconer; and a variety of others too numerous to specify.

The Literary Fund Dinner.—The annual festival of the Literary Fund took place at the Freemason's Tavern on Wednesday, and was in every respect the most brilliant meeting which has yet occurred in the annals of the Society. His Royal Highness Prince Albert presided, and about 300 gentlemen were present, including some of the most eminent authors of the day. The Prince was supported by the Duke of Cleveland; the Russian Ambassador; the Prussian and American Ministers; Mr. Washington Irving, the new Minister from the United States to Madrid; the Marquis of Lansdowne, the Marquis of Exeter, the Marquis of Northampton, the Archbishop of Dublin; the Bishops of Chichester, and of Gloucester and Bristol; the Earl of Arundel and Surrey; Lords Monteagle, Ashley, Jocelyn, Teignmouth, Colville, and Mahon, and a large number of distinguished visitors. Immediately after the cloth was removed, Prince Albert rose and said, "Gentlemen, the first toast I have to give is the health of the Queen. I know that she highly appreciates the tendency of this institution, and I have her permission to say that she is a sincere well-wisher to it, and that she feels very much interested in its prosperity. Gentlemen, I give you 'The Queen—our munificent patron.'" The toast was received with much enthusiasm; after which the health of the other members of the Royal Family was given. Several toasts were then proposed, including the Archbishop of Dublin and the Church, the Army and Navy, and several others. Prince Albert then rose and said, "The toast I am now to propose is, 'Prosperity to this institution.' It stands unrivalled in any country, and ought to command our warmest sympathies in providing for the exigencies of those who, feeling only the promptings of genius, and forgetting every other consideration, pursue the grand career of the cultivation of the human mind, and the promotion of the arts and sciences. It is surely proper gratefully to remember the benefits we have derived from the disinterested exertions of these great and good men, and cheerfully to contribute to their wants and aid their necessity. I conclude with a warm wish that the object, for the promotion of which we have met, may be answered in the most ample and generous manner. I propose 'Prosperity to the Literary Fund.'" The toast was drank amid loud cheers. The Marquis of Lansdowne, as President of the Society, returned thanks, and proposed the health of Prince Albert. The toast was drank amid the most enthusiastic applause. Prince Albert then said, "I must return you my best thanks for the kindness with which you have received this toast. I can assure you that it will always make me most happy when I can in the smallest degree add to the welfare of those institutions which so prominently distinguish this country." The report was then read, from which it appeared that thirty-eight individuals had been relieved, to the extent of 785*l.*, during the last year, and that from the foundation of the society no less than 27,828*l.* have been distributed to more than a thousand applicants. Amongst the subscriptions for this year were announced, her Majesty the Queen 100 guineas, Prince Albert 100*l.*, and the King of Prussia 100*l.*; the Marquis of Lansdowne, 50*l.* The Prince then proposed the health of the Marquis of Lansdowne, President of the Institution. He said "it would be impossible to enumerate his merits, they are so many and so great; but I feel great satisfaction in having this opportunity of stating how much I esteem him." The toast was warmly received. Among the speakers who followed, were Baron Brunnow, the Russian Ambassador; the Marquis of Northampton; Mr. Campbell, the poet; Mr. Hallam, Lord Mahon, Mr. Thomas Moore, Mr. Washington Irving, Mr. Murchison, Sir R. H. Inglis, Mr. Sergeant Talfourd, &c. At the close of the list, Prince Albert rose and said, "I suppose, gentlemen, you would not like to part without proposing the health of the ladies. Gentlemen, 'The Ladies.'" The Prince left a few minutes before 12, and was followed by the rest of the company. It was announced that the subscriptions amounted to 1100*l.*

Metropolitan Improvements.—A memorial has been sent to the Lords of the Treasury from the inhabitants of Piccadilly, the object of which is to obtain a uniform width of street between Hyde Park-corner and Piccadilly, by taking in portions of the Green Park on the site of the late Green-Park-lodge. The result of the application has not yet been made known.—At a Court of Common Council held on Wednesday, Mr. R. L. Jones brought up the report from the committee for carrying into execution the several Acts of Parliament for improving the approaches to London-bridge. It is a document of considerable interest, and states "that since the Committee's report of the 24th Feb., they have had several interviews with the different branches of Government upon the subject of the priority of the charge of 40,000*l.* proposed to be raised for the improvements in the neighbourhood of the Royal Exchange; and that they have received the consent of Government that the Court of Common Council shall be empowered to raise the sum of 40,000*l.* in priority over the charges authorised to be made by the Commissioners of her Majesty's Woods and Forests for the purposes of improvement in various parts of the Metropolis. That pending the negotiation with Government upon this important point, the subject of the 25,000*l.* recommended by the select committee of the House of Commons on Metropolitan Improvements to be raised by the Commissioners of Her Majesty's Woods and Forests for the continuation of New Farringdon-street towards Clerkenwell-green, was brought under consideration; and it being ascertained that there was very little prospect that the said sum of 25,000*l.* on the credit of the Improvement Fund would be applied immediately for the continuation of New Farringdon-street, Government would consent that the said sum of 25,000*l.* should also have priority after the sum of 40,000*l.*, and before sums authorised to be charged as aforesaid by her Majesty's Commissioners. The report proceeds to state, that considering the proposed new street towards Clerkenwell-green is a continuation of the improvement already effected by the Court of Common Council at a very considerable expense, and that without such continuation the improvement effected by the corporation of London will be of no public advantage, and much depreciate the value of the ground to be disposed of by this Court, and that as Government have consented to postpone the payment of the sums authorised to be charged by them upon the said improvement, amounting to near 500,000*l.*, until the said sums of 40,000*l.* and 25,000*l.* and interest are repaid, the committee cannot entertain any reasonable doubt that the said sums of 40,000*l.* and 25,000*l.*, and interest, will be repaid by the said Improvement fund; and they, therefore, recommend to the Court that they should be empowered in the bill now before Parliament to raise the sum of 25,000*l.* for the continuation of the new Farringdon-street, in addition to the said sum of 40,000*l.*" Mr. R. L. Jones briefly stated the advantages which would arise from the negotiation with Government; after which the report was unanimously agreed to, and referred back to the committee to be carried into effect.—Among the numerous plans for "piercing" the City, ordered by the House of Commons, is one to be adopted for opening a new street facing the portico of the General Post-office, and running westward towards Holborn-hill; this will occasion the removal of some houses in St. Martin's-le-Grand, and must cross St. Martin's-court, Bath-street, Butcherhall-lane, Christchurch-passage, and terminate with the removal of the houses in Newgate-street, Nos. 93 to 99 inclusive, thereby reducing the great traffic and numerous obstructions in that important thoroughfare. The aspect of Pall-mall, as well of St. James's-square, is to be improved in a decided manner, by removing some of the central houses now forming the south side of St. James's-square, extending the garden inclosure down to Pall-mall, and placing where the statue now is, the Egyptian obelisk now on its way to this country, and which will thus be seen advantageously from St. James's-street, Regent-street, Pall-mall, and the Haymarket.

Public Meetings.—The annual meeting of the shareholders of the Assam Tea Company, established for the purpose of extending the cultivation of the tea-plant in Assam, was held on Monday. The secretary read the report of the directors, which was of considerable length, but the following will be found to be the chief points of interest in it. It commenced by stating that the enterprise was no longer of doubtful success if conducted with prudence. The first shipment of tea, which was received in Dec. last, amounted to 10,212 lbs., and was almost all made in the northern division, the clearings in the southern having been only just commenced. It was sold in Jan., and fetched on an average 3*s.* per lb. It was carefully examined and reported on by competent judges, and considered to be better than any that had been produced before. The quantity of land suitable for the cultivation of the plant contained in the company's grant was 25,774 poorahs, the poorah being equal to 52,900 square feet, and upon an average each would have 1,600 plants capable of yielding 400 lbs. of tea. In five years the plants arrived at full produce. It was estimated that, including the produce of 1845, there will have been made 850,000 lbs. from the lands now in cultivation. This, at an average of 2*s.* per lb., would realise 85,000*l.*, from which must be deducted the expenditure of the company. The annual value of the teas produced in 1845, from the land now in cultivation, would be 32,000*l.*, and the annual charge 23,100*l.*, leaving a balance of 8,900*l.* The produce of teas in 1840 was 10,000 lbs.; in 1841, 30,000 lbs.; this year the estimated produce will be 80,000 lbs.; in 1843, 160,000 lbs.; in 1844, 240,000 lbs.; and in 1845, 320,000 lbs. The Government of India had shown little disposition to extend the land belonging to the company, being fearful of monopoly; but there had been tea districts discovered in Assam which, if cultivated, were sufficient to supply the whole world with tea. It appears that the difficulty arising from the expected necessity of depending entirely upon the labour of natives from China for the manufacture of the tea has been overcome, and that the native Assamese are quite competent to all the duties required. Where Mr. Bruce, the agent of the company, has been located, almost all the Chinese have either absconded or died, and their number had dwindled down from 300 or 400 to three or four persons. Under such difficulties it was considered remarkable that Mr. Bruce could have produced what he had done. Tea trees were found in abundance in the jungles, thirty or forty feet high, not unlike mops, from the stumps of which, when cut green, sprung a great number of little shoots, some having 2,000 each, which were either left or transplanted into gardens, and thrived very well. From Mr. Bruce's experience, who has conducted the East India Company's gardens for six years, it appears that each plant will, after the third to the fifth year, produce about 20 tohlas, or half a pound of tea each; and the plants live for a considerable number of years. In reply to some questions, it was stated by Mr. Prinsep, a gentleman only arrived a few months since from Assam, that there was no evidence as to the length of time the stumps of trees continued to throw out shoots; but botanists had calculated the trees in Assam to be from 140 to 180 years old. The tea was made from four leaves picked from the end of the branches; and the cost of producing tea would be reduced as the process of manipulation became better known. The clearing of the land from large trees was expensive; and where the trees were cut down, there they remained till destroyed by the white ant, which existed in great numbers. Mr. Prinsep added, as a singular proof of the care of nature for the propagation of the tea plant, that while the trunks of the trees felled were set upon by the ants, and soon destroyed, the tea tree and its numerous shoots were avoided. The report was adopted unanimously.

East India House.—A special general court was held at the East India House on Wednesday, for the purpose of taking into consideration the proposed alterations in the English tariff, so far as they might affect the produce and manufactures of the East Indies, and also for the purpose of petitioning both Houses of Parliament on the subject. Mr. M. Martin first addressed the court; he spoke at great length on the subject for which they were met, and concluded by moving the following resolution:—"That, in the opinion of this court, the territories under the government of the East India Company ought to be treated as integral portions of the British empire; and that as a revision of the English tariff is now taking place, this court, in fulfilment of its duty to their fellow-subjects in British India, do again petition both Houses of Parliament, praying for a complete reciprocity of trade between India and England, which, if fully and fairly established, will confer mutual and extensive benefits on both countries, and materially contribute to the security and permanence of the British power and influence in the eastern hemisphere." The resolution having been seconded, the chairman directed the clerk to read a series of letters addressed by the Board of Directors, submitting for the consideration of the Board of Control some remarks on the disadvantages under which India laboured, in the hope that Government would be induced to remove them. These letters stated that in the important articles of sugar and rum a liberal relief had been afforded; but in some cases India had not been treated with equal consideration. The chairman then said he hoped and believed that, after hearing that correspondence, the Court would be of opinion that the Directors had not been inattentive to the interest of India in respect to the important matters brought under the consideration of the court by Mr. Martin, and suggested the propriety of that gentleman's withdrawing his motion. After a prolonged conversation, Mr. Martin finally withdrew his motion, and a resolution to the following effect was agreed to:—"That this court desires to record its entire concurrence in the representations which, as appeared from the documents just read, had been made by the Board of Directors to her Majesty's Government, respecting the duties on articles the produce of countries directly or indirectly under the government of the East India Company, and express its hope that the statements and correspondence will receive due consideration." It was further resolved that the chairman be requested to communicate a copy of the resolution to the Board of Control and the Prime Minister.

Police.—The trial of Daniel Good, for the murder at Roehampton, took place yesterday at the Central Criminal Court, before Lord Denman, Mr. Baron Alderson, and Mr. Justice Coltman. The Court was crowded with visitors, among whom were the Duke of Sussex, the Prussian Minister, and a great number of the City authorities. The trial lasted 11 hours; but the main facts adduced in evidence are already before the public, and do not require to be repeated. The Jury returned a verdict of Guilty, and sentence of death was passed in the usual form. The prisoner then addressed the Court, declaring that he was innocent, and that the woman died by her own hand; upon which his counsel declared that no such statement was contained in his brief, and that he heard it for the first time.

Mortality in the Metropolis.—The following is the number of deaths in the Metropolis from all causes, registered in the week ending Saturday the 30th ult.:—males, 422; females, 361; total, 783. Weekly average 1838-9-40-1, males, 467; females, 445; total, 912.

Strawberry-Hill.—The sale of the curiosities and works of art, at this place, still continues to excite general interest; and the attendance of visitors during the past week has been more numerous than on any previous occasion. The articles sold this week have consisted of jewels, trinkets, the antiquities, the Middleton collection, the collection of early gems and missals, paintings, &c. There has been a good deal of competition for many of the articles, and the gross sum realised is already considerable.

Provincial News.

Cambridge.—It is announced that the installation of the Duke of Northumberland, as Chancellor of this University, will take place on Monday the 4th July. The Duke of Wellington has accepted the invitation to be present, and will occupy Catherine-hall during his stay. The Master and Fellows of Trinity College will give an entertainment to his Grace the Chancellor, on the 6th July, and a ball in the Fitzwilliam Museum will be held the same evening. The rumour gains credence that H. R. H. Prince Albert will be present at the installation.—A local paper announces it as beyond all doubt, and states, that his Royal Highness will do the Master and Fellows of Trinity the honour of sojourning at the lodge during the festivities. The same paper adds, "In order that the reception given to the illustrious Prince may be equal to the occasion, the Master and Fellows, at a meeting held last week, voted 1000*l.* for additional furniture; and to provide every necessary accommodation to the Prince's suite, temporary buildings and marquees will be erected." Another local paper, however, contradicts the rumour.

Exeter.—A local paper informs us that the first effects produced by the contemplated New Tariff of Government upon agricultural stock in this district, has been upon asses: and that these animals have already been purchased in Bideford Great Market, for 6*s.* each, while 12 months ago it appears they would have sold from 30*s.* to 40*s.* each.

Leeds.—A fatal accident, resulting from the incautious use of fire-arms, occurred a few days since in this town. It appears that a Mr. Hepworth, surgeon, took out a double-barrelled gun for the purpose of shooting small birds, and, on his return home, placed it in one of the rooms of his house, under the impression that the contents of both barrels had been discharged. This, however, was not the case, and in the evening one of the sons of Mr. Hepworth, 11 years old, being in the room with his brother and a young girl, took up the gun, and saying he would teach them how to shoot, presented it at the latter, when the gun went off, and the contents lodging in the girl's head, killed her on the spot.

Manchester.—The serious distress which has for some time past prevailed in this and many other manufacturing districts of the country, and which has been endured by the labouring classes with great fortitude and patience, appears now to have more immediately engaged the attention of Government, by whom it is stated to be in contemplation to issue forthwith a Queen's letter, inviting contributions in the several places of worship throughout the three kingdoms, for the purpose of affording more adequate relief to the industrious population of the manufacturing districts, than local subscriptions can be expected to yield. A conference was held on Saturday upon this subject at the House of Sir R. Peel in Whitehall, at which the First Lord of the Treasury, the Secretary of State for the Home Department, the Archbishop of Canterbury, and the Bishop of London were present, and at which it was determined that the above appeal should be immediately made to the benevolence of her Majesty's subjects.—It is announced that the twelfth annual meeting of the British Association for the promotion of Science, which will be held in this town, has been fixed by the local council, with the consent of the London council, to commence on the 23d June. Great preparations are making for the reception of the members, and the arrangements for the meetings and exhibitions are said to be on a large scale.

Southampton.—On Saturday the British Queen steamer, which, it will be remembered, was some time since sold to the Belgian Government, for the purpose of running between that country and the United States, calling at this port on her way, arrived here from Antwerp and took her departure for the first time. Her crew consists of nearly 100 men, and the officers and great number of the men are Englishmen. She had on board a large number of passengers from Belgium, and a number also left in her from this country.

Windsor.—The committee appointed for the purpose of erecting a statue at Eton to the memory of the late Provost, Dr. Goodall, have selected Mr. Weekes as the sculptor to execute the work.

Railways.—The following are the receipts of the principal railways for the last week:—Brighton, 2,497*l.*; Blackwall, 948*l.*; Manchester and Birmingham, 406*l.*; Birmingham, 17,405*l.*; Croydon, 487*l.*; Greenwich, 927*l.*; South Western, 6,041; Northern and Eastern, 1,415; Manchester and Leeds, 4,002*l.*; Great Western, 13,377*l.*; Birmingham and Derby, 1,127*l.*; North Midland, 4,026*l.*; Great North of England, 1,168*l.*; Midland Counties, 2,701*l.*; York and North Midland, 1,475*l.*; Edinburgh and Glasgow, 2,016.—At the Half-yearly Meeting of the Cheltenham and Great Western Union Railway Company, which was held a few days since, the Directors stated that the success of the progress of their Bill in Parliament was indicative of future prosperity; and as soon as it received the Royal assent, which was the only step now required to make it law, it was proposed that a special meeting of the shareholders should be called. In the mean while it was proposed to make a call of 7*l.* 10*s.* per share to meet current liabilities, which was unanimously agreed to, as also the declaration of a dividend of 25*s.* per share out of the profits of working, payable on the 24th June. Under the new Bill the half-yearly meetings will be held in Feb. and Aug. The total expenditure of the Company up to the 25th Dec. was 462,576*l.* 19*s.* 2*d.*, and the subsequent expenditure to the 25th April was 40,397*l.* 1*s.* 9*d.*

IRELAND.

Dublin.—It is announced that his Excellency Earl de Grey will return to this city in the course of the ensuing week, and that the Countess will give a ball at the Castle on the 24th inst., in honour of the Queen's birthday.—A meeting of the Repeal Association was held on Wednesday; Mr. O'Connell was present and spoke at great length. "Murder," he said, "again stalks abroad through the land. The disturbed state of some districts was enough to fill them with alarm, and it was almost with the agony of despair that he feared the crimes of some might be followed with the punishment of all. He looked upon the murdered landlord and the assassinating tenant as part of the misery in the history of Ireland, and he charged the political apathy of the Irish people as being instrumental in the commission of crime; for it was part of Irish history that agrarian crimes diminished in proportion as political excitement prevailed throughout the country. He called upon all patriots to rally round his standard. If they had 3,000,000 of Repealers, they would soon have that Act of Parliament passed which would give fixity of tenure to the tenantry and render murder impossible in Ireland. Mr. O'Connell concluded his speech with some severe animadversions on the character and policy of the present Government. The other proceedings of the meeting were devoid of interest.

Tipperary.—A meeting of magistrates of this county was held on Monday, at Nenagh, at which a requisition to the High Sheriff was adopted, who has, in consequence, convened another meeting of the magistrates of three baronies, to consider the disturbed state of the district. The local papers contain farther accounts of outrages, chiefly arising out of disputes about land.

SCOTLAND.

Inverness.—The local papers observe, on the subject of salmon-fishing, that some of the northern rivers have already been pretty successful; that the Connon, Shin, and Findhorn have fished well; and that one day lately, no less than 400 salmon were taken at one time at the mouth of the Findhorn.

Dumfries.—A few nights since the moor at Innerkip took fire, and extended for a distance of two miles, destroying young plantations, and everything else on the surface of the soil. The breadth of the conflagration varied according to the nature of the ground, and it was a considerable time before the flames were got under. The particulars as to the breaking out of the fire are not stated, but the loss is said to be very considerable, and a large quantity of game has perished.

THEATRICALS.

Covent Garden.—On Thursday the opera of "Die Vestalin," for which its author, Gasparo Spontini, obtained the prize from the Académie Impériale in 1807, was performed by the German corps at this theatre, for the first time in this country. The plot, which is interesting, is as follows:—*Julia*, a young Vestal (Mad. Schodel), is in love with *Licinius* (Herr Eichberger), a Roman General, who obtains the assistance of his friend and brother-soldier *Cinna* to carry her off from the atrium, or dwelling of the vestals; *Licinius* has just returned triumphant from the field of battle, and proceeds in triumph to the atrium to receive the wreath of victory; the presentation of which falls to the lot of *Julia*, she being the youngest of the vestals. During the performance of the ceremony he bids her hold herself ready for flight. The second act opens with a Vesper hymn, after which the *High Priestess* confides the vestal flame to the care of *Julia*; *Licinius* makes his appearance, and is about to fly with *Julia*, when the fire on the altar becomes extinguished; the voices of the populace are heard without; *Licinius* escapes without being detected; but *Pontifex Maximus*, aware that some man has entered the precincts of the atrium, *Julia* is condemned, and sentenced to be buried alive, which sentence is about to be executed, when *Licinius* arrives with a body guard, and confesses himself to have been the guilty one who broke into the temple, and offers his own blood in expiation; *Julia* descends into the grave, declaring that she knows not the Roman; *Licinius* follows her; *Pontifex Maximus* calls upon the Romans to defend the altar; a fight ensues between the lictors and the soldiers, when a flash of lightning burns the vestal veil of *Julia*, which is laid upon the altar, and the flame is rekindled. This is pronounced by *Pontifex* a "heavenly miracle," and he calls upon the people to witness the union of *Julia* and the Defender of Rome. The opera was well got up, and was favourably received, though the house was not numerously attended.

Miscellaneous.

British Mission in North Africa.—At the ordinary meeting of the Royal Geographical Society, held on Monday, some interesting particulars were read of the progress of the British mission in Upper Abyssinia and other parts of Northern Africa, under the direction of Capt. Harris. The communication was brought down by Lieut. Barker, of the Indian navy, who was eighteen days in travelling from Ankaber to the coast. A commercial treaty had been negotiated with the King, who was well pleased by his alliance with the British, and satisfied with all their proposals, and everything was going on well, the officers of the expedition being in good health. Aden in the vicinity would, it was expected, soon become a commercial emporium of great importance; and so great had been its increase, that whilst in 1830 the population was but 300, it had now increased to upwards of 20,000.

Slave Trade.—A letter has been published from an officer of her Majesty's sloop Fantome, Capt. Butterfield, dated the 14th Feb., off Ambriz, from which we learn that that vessel had captured, on the 12th Feb., two slave-vessels, one name unknown, with 505 slaves, and the other the Diligencia, with 413 slaves on board. This makes 19 vessels captured, and 2,261 slaves liberated, by that vessel in the 20 months she has been employed on the coast of Angola.

Law.

Court of Chancery.—*Cockburn* v. *Raphael.*—This was an appeal against an order of the Vice-Chancellor, refusing an account of certain funds left by the late Mr. Raphael, for the education and maintenance of poor Armenian boys at Venice. Mr. Raphael, the son of the donor of the charity, had taken a tour to Venice, and requested an account of the disbursement of the charity, which, as a matter of right, was refused, on the ground that the conductors of the establishment were not accountable. Mr. Raphael also desired an inquiry into the scheme and management of the charity, and also suggested the propriety of removing the establishment to England. He also alleged, that the funds were adequate to the support of a greater number of boys, who were now 14 only. On the other side it was contended that the present scheme worked out the objects of the founder of the charity, and that the charges of extravagance and mismanagement were untenable. If an account were reasonable, it might be obtained in Venice; but the present petition was unsupported by the facts. As to the fewness of the boys, it was the intention of the conductors of the establishment to take more.—The Lord Chancellor said, he had looked over the affidavits and accounts, and he was of opinion that there was no good ground of complaint against the present management of the charity. It appeared that much of the expenditure hitherto was necessarily consequent on the foundation of the school, and that this expenditure must, of course, diminish when the preliminary arrangements were completed. His Lordship had no doubt that the number of boys would be increased when the funds permitted such an increase. The appeal must be dismissed with costs. His Lordship made no observation on the petition, because he considered that the relation of the petitioner to the founder of the charity rendered it undesirable.

SPORTING.

NEWMARKET SECOND SPRING MEETING.

Tuesday.—The weather was fine, but the attendance of visitors was not numerous. The races commenced with

Match, T. Y. C. 50.—Duke of Bedford's King of the Peak (Robinson), beat Lord Exeter's Abydos. Betting, 5 to 4 on Abydos. Won easily by half a length.

Match, 100, *D.M.*—Mr. Pettit's Langolee (Pettit), beat Mr. Treen's Haitoe by a length, easy. Betting 11 to 8 on Langolee.

Match, T. Y. C. 50.—Lord Exeter's Abydos (Darling), 0; Lord Albemarle's Nuncio, 0. Betting, 3 to 1 on Nuncio. A dead heat.

50*l. for three-years-olds, R.M.*—Gen. Yates's Seahorse (Chapple), 1; Mr. Dixon's Ballinkeele, 2.

The following also started, but were not placed:—Duke of Beaufort's ro. c. by Camel, out of Miss Craven's dam; Mr. Pettit's f. Wire; Duke of Bedford's c. by Mundig, out of Misnomer; Lord Orford's c. by Emilius, out of Wild Duck; Mr. Goodman's Rover, Lord Verulam's Robert de Gorham, and Mr. Combe's Rosalind. Betting, 7 to 4 on Ballinkeele, 5 to 1 agst Robert de Gorham and Rosalind. The Duke of Beaufort's colt made the running, followed by Robert de Gorham and Rosalind, the others lying up, and the pace good. They ran in this order to the Ab. M. bottom, where Seahorse and Ballinkeele singled themselves out, and ran a severe race home, Seahorse winning by a head. Rosalind, Rover, and Robert de Gorham were well up.

50*l. for three-years-olds, T. M. M. The winner to be sold for* 200*l.*—Duke of Rutland's Sir Hans, 1; Lord Orford's Young Quo Minus, 2.

The following were not placed:—Mr. Pettit's Michaelmas Day, Duke of Grafton's f. Ohio, Lord Albemarle's Robin, and Mr. Rogers's Prosody. Betting, 2 to 1 agst Sir Hans, 3 to 1 agst young Quo Minus, and 7 to 2 agst Michaelmas Day (taken). Won easy.

Produce Sweepstakes of 200 *sov. each, h. ft., T.Y.C.* (3 *Subs.*)—Col. Peel's c. by Slane, out of Jason's dam, and Mr. Greville's Portumnus, divided the forfeit.

Lord Exeter's Scutari received forfeit from the Duke of Bedford's Oakey, *T.Y.C.* 200, half forfeit.

Wednesday.—The Jockey Club Plate of 50*l.*, *B.C.*—Duke of Rutland's Flambeau (Robinson), 1; Mr. Batson's Barbara, 2; Lord Kilburne's c. by Muley Moloch, d. by Actæon, 3. Betting, 11 to 10 agst Barbara, 6 to 5 agst Flambeau, and 10 to 1 agst the colt. Won very easy by half a length.

Handicap Plate of 50*l.*, *A. F.*—Mr. Newton's Ma Mie (Hall), 1; Lord Kelburne's c. by Retainer, d. by St. Patrick, 2; Mr. Osbaldeston's The Mountain Sylph, 3; Lord Jersey's Joachim, 4; Duke of Rutland's f. by Bizarre out of Flambeau's d., 5. Betting, 5 to 4 agst Bizarre filly, 3 to 1 agst Ma Mie, 9 to 2 agst Joachim, and 5 to 1 agst Lord Kelburne's colt and Mountain Sylph. Won by two lengths.

The Suffolk Stakes of 15 *sovs. each, with* 100 *sovs. added, the second to receive* 30 *sovs. out of the stakes. Last mile and a half of the round course.* 27 *subs.*—Mr. Beresford's Bob Peel (Butler), 1; Lord Albemarle's Ralph, 2; Duke of Richmond's The Currier, 3; Mr. Goodman's Miss Fidget, 4; Mr. Osbaldeston's The Devil among the Tailors, 5; Mr. Treen's Una, 6; Mr. Greville's Rory O'More, 7. Betting, 9 to 4 agst The Devil among the Tailors, 3 to 1 agst Ralph, 5 to 1 agst Rory O'More and The Currier, 8 to 1 agst Bob Peel, and 10 to 1 agst Una. Won by half a length.

Thursday.—*Handicap Sweepstakes of* 20 *sovs. each. T. Y. C.* (5 *subs.*)—Lord Albemarle's Minaret (E. Edwards), 1; Mr. F. Craven's That's-the-Time-of-Day, 2; Mr. Payne's bl. c., by Sheet Anchor, 3; Mr. Thornhill's Menelippe, 4. Betting, 6 to 4 agst That's-the-Time-of-Day; 3 to 1 agst Lady Fulford colt; and 3 to 1 agst Minaret. Minaret made all the running, and won in a canter by three lengths.

Sweepstakes of 10 *sovs. each. T. Y. C. The winner to be sold for* 200*l.*, *&c.* (4 *subs.*)—Mr. F. Craven's That's-the-Time-of-Day (Bartholomew), 1; Lord Orford's Young Quo Minus, 2. The following also started, but were not placed: Col. Peel's Hawkseye, and Lord Albemarle's Minaret. Betting, 5 to 4 agst Young Quo Minus, and 5 to 2 agst Hawkseye. A close race between the first two, and won by a head only. Hawkseye and Minaret were beaten off. The attendance was very thin, and the weather unfavourable, the rain having set in early in the morning.

TATTERSALL'S, (Thursday).—There was a very numerous attendance, and the room was crowded until near seven o'clock, and business was the "order of the day." Coldrenic and Attila were steady at the prices quoted below, the former with occasional backers until near six o'clock, when a noble Lord checked the disposition to invest by an offer of 1,000 to 400. Nothing of any consequence was done on the other under 4 to 1, but at that figure two or three were willing to get on. Canadian and Auckland were stationary; not so two of Scott's non-favourites, Jack and Meteor; the inclination to back the first was general, and its effect on his position was shown in an improvement of six points compared with the latest quotations from Newmarket. Meteor's party, if more select, was strong enough to give him a decided lift. Lasso had a host of supporters at 25 and 20 to 1; the last bet was 2,000 to 100, and the layer would have gone on. Chatham was in force at 22 to 1, and at the finish would have been taken for choice against Lasso. The Lord of Holderness is quoted at 18 to 1, but nothing was done outright about him. Tiptoe was quite out of the market. A few Oaks bets were made at the old prices.

DERBY.

7	to 4 agst	Scot's lot	25	to 1 agst	Meteor (taken)
5	2	Coldrenick (taken and aft. offered)	40	1	Barrier
7	2	Attila (take 4 to 1)	50	1	Agreeable colt (taken)
9	1	Canadian	50	1	Tiptoe
11	1	Jack (taken)	100	1	Cheops (taken)

7	1	Adela filly	20	1	Belle Dame
16	1	Firebrand (taken)	25	1	Ma Mie

MARK LANE, Friday, May 13.—The Wheat trade was very inactive this morning, but the trifling sales made were at Monday's prices; some cargoes have been sold afloat on about the same terms. There is very little disposition evinced to pay duty, and it is expected 1s. lower next week.—We observe no alteration in the value of Barley, Peas, or Beans, and the Oat trade is steady at Monday's quotations.

Blackley, of Peckham, to Priscilla, 3rd daughter of the late U. Price, Esq., of King-street, Snow-hill—On the 12th inst., at Lewisham church, the Hon. and Rev. H. Legge, to Marian, daughter of F. Leman Rogers, Esq., of Blackheath.

DIED.—On the 4th inst., at Mote Park, deeply regretted, Lady Charlotte Crofton, widow of the late Hon. Sir E Crofton, and daughter of John, 7th Earl of Galloway, aged 64—On the 11th inst., in Endsleigh-street, Tavistock-square, S. Seaward, Esq., of the Canal Iron Works, Limehouse—On the 10th inst., in Cadogan-place, T. S. Pemberton, Esq., of the Island of Nevis, aged 42—On the 11th inst., in his 65th year, J. Hicks, Esq, of High-street, Southwark, and Streatham, Surrey—On the 13th inst., at Islington, C. Cousins, Esq., Secretary and Accountant of the Australasian, Colonial, and General Life Assurance-office, after a short illness, aged 31—On the 3rd ult., at Madeira, Sir A. W. Leith, Bart.—On the 8th inst., at Cheltenham, Lieut.-General Sir W. Wilson, K.C.H., in his 80th year.

EVERY LADY HER OWN GARDENER.
Second Edition, with Wood-cuts, fcap. 8vo., 6s.,

PRACTICAL INSTRUCTIONS in GARDENING for LADIES, with DIRECTIONS for EVERY MONTH in the YEAR. By Mrs. LOUDON.

John Murray, Albemarle-street.

In Monthly Nos., 8vo, with Four beautifully coloured Plates.
Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY. The Number for May, 1842, contains highly-finished drawings of *Franciscea latifolia*, *Calceolaria Standishii*, *Zieria laevigata*, and *Rhododendron Smithii aureum*; likewise Papers on Gardening as a science, with illustrative woodcuts; on Improving Indigenous Plants; Baskets for Orchidaceæ, copiously illustrated with engravings; Floricultural Notices of new and beautiful Plants figured in the chief Botanical Periodicals for March and April, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

IMPORTANT WORKS ON BOTANY AND GARDENING, published by Ridgway, Piccadilly; and to be had, by order, of every country Bookseller.

1.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols., beautifully coloured, price 25s. each.

2.

DR. LINDLEY'S BOTANICAL REGISTER. Published monthly, price 3s. 6d. each Number, containing Drawings from Nature of the newest and most beautiful Plants, with Directions for Cultivation, &c. &c. The volume for 1841 is now ready, price 2l. 2s.

"The Botanical Register, from containing most or all the new Plants introduced by the Horticultural Society, from the great care with which its plates are executed, and the judicious remarks on culture and general habit, by Dr. Lindley, is, in consequence, the superior publication."—*Loudon's Magazine of Botany, &c.*

"Too much praise cannot be bestowed upon this work."—*Horticultural Cabinet.*

3.

DR. LINDLEY'S SERTUM ORCHIDACEUM. A Wreath of the most beautiful Orchidaceous Flowers, in Ten Parts, price 25s. each. This splendid work is now complete, the Tenth Part being just published.

4.

DR. LINDLEY'S BOTANICAL HISTORY OF ROSES, with Coloured Plates, price 21s.

5.

DR. LINDLEY'S ACCOUNT OF THE BOTANY OF SWAN RIVER, with Coloured Plates, price 10s. 6d.

6.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS. Illustrated by Drawings on Stone, from the Sketches of Francis Bauer, Esq., F.L.S., &c. Complete in Four Parts, beautifully Coloured, price 30s. each.

7.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS, in 8vo, in Seven Parts, is now complete; and Subscribers are respectfully requested to make up their sets as soon as possible, several of the early Numbers being nearly out of print.

8.

DON'S EDITION OF SWEET'S CATALOGUE OF PLANTS, corrected to the present time, without Supplements. Price 21s. cloth boards, arranged.

"It certainly is the most complete and useful Catalogue that has yet appeared, as, in one line, it gives the systematic and English names, where described, of what country it is a native, the year introduced, the months when in flower, whether hardy or tender, its duration, and reference to the books in which it is figured; and where any names have been lately changed, a synonym is given in Italics, to show what it is changed from. It also contains nearly double the number of Plants contained in any other Catalogue that we have seen; so that, on the whole, we believe it could not have been more complete. In our opinion, the arrangement according to the natural system is far preferable to that of an artificial one, particularly for cultivators; and on this account the present work should be in the hands of all gardeners and cultivators of plants; and the reference to the figures will also render it very useful to the botanist.—*Gentleman's Magazine.*

9.

Sixth Edition, in one large vol. 8vo, price 16s.

SWEET'S BOTANICAL CULTIVATOR; or, Hothouse and Greenhouse Manual: giving full Practical Instructions for the Management of all the Plants cultivated in the Hothouses, Greenhouses, Frames, and Borders, in the Gardens of Great Britain; with Plain Directions for the Management of Bulbs and Plants in Rooms, &c.

"Indeed what Mr. Sweet has said on the Culture of Bulbs and Epiphytes, in the last Edition of his Botanical Cultivator, may be considered as the *ultimatum* on this subject for the British Gardener."—*Gardener's Magazine.*

This Edition corresponds with the New Edition of Sweet's Hortus Britannicus, and contains for the first time, Genus Orchidaceæ.

10.

THE FRUIT-GROWER'S INSTRUCTOR. By GEORGE BLISS, Nurseryman. Containing full Directions for Planting and Cultivating of Fruit trees; with Instructions for Forcing, and Lists of the best kinds of Fruit for every purpose: also Directions for Hothouse Building, and the most Improved Modes of Heating. Second Edition, enlarged, price 6s.

Price Two Shillings in cloth, coloured plates.

FLOWERS: a Hand-book for Cultivators; being a practical Guide for the use of Amateurs and Gardeners. By JAMES MAIN, A.L.S., Author of "Fruit-Trees" and "Kitchen-Garden."

Price Two Shillings in cloth.

FRUIT-TREES: a Hand-book for Cultivators; being a practical exposition of the art of pruning Fruit-Trees; showing the defects and difficulties of modern practice, with proposed remedies; including advice and information, founded on long experience and extensive observation. By JAMES MAIN, A.L.S.

Price Two Shillings in cloth.

THE KITCHEN-GARDEN, a Hand-book for Cultivators. Containing full directions for the profitable culture of all kinds of culinary vegetables. By JAMES MAIN, A.L.S.

Cloth, gilt edges, price 6s.; silk, 7s. 6d.; or morocco elegant, 8s. 6d.

THE SENTIMENT OF FLOWERS: with Twelve Groups of Flowers, tastefully designed and coloured, by the Editor of "Woodland Gleanings."

> "In Eastern lands they talk in flowers,
> And they tell in a garland their loves and cares:
> Each blossom that blooms in their garden bowers
> On its leaves a mystic language bears."

This work teaches the eloquent language referred to in the above beautiful lines. As in the East, so in the fair island of Britain, "flowers are here made the language of sentiment."

"A charming little book. With a dozen of sweet floral coloured plates, it is precisely the thing for a fair lady's boudoir."—*Literary Gazette.*

With coloured Plates, Price 6s.; silk, 7s. 6d.; morocco, 8s. 6d.

THE QUEEN OF FLOWERS; or, MEMOIRS OF THE ROSE; being Botanical, Poetical, and Miscellaneous Recollections of that celebrated Flower.

New Edition in cloth, 6s.; silk, 7s. 6d.; morocco elegant, 8s. 6d.

THE BOOK OF BOTANY; being a popular Introduction to that delightful Science. Comprising a general, descriptive, and physiological account of the Vegetable Kingdom; a synopsis of the Linnæan Classification; and a comprehensive Introduction to the Natural System. With Twelve coloured Plates, and upwards of One Hundred Engravings on Wood.

"An excellent little book for young persons, which we can most strongly recommend."—*Loudon's Gardener's Mag.*

"A clear and concise introduction to the science."—*Spectator.*

In cloth, gilt, Price 2s. 6d.

HINTS ON LETTER-WRITING; containing Introductory Observations—General Maxims—Letters of Business—Letters of Courtesy—Style—Letters of Duty—Letters of Friendship—Notes—Love-Letters—Forms of Address; with illustrative examples from Napoleon, Wellington, Lord Hill, Humphry Davy, Goldsmith, Walter Scott, Horace Walpole, Pope, Mrs. Hemans, Cowper, Byron, Doddridge, &c. &c.

R. TYAS, 8, Paternoster Row.

This day is published, in 8vo, price 21s., a few on large paper (royal 8vo) for colouring, price 2l. 2s.

HERALDRY OF FISH.—Notices of the principal Families bearing Fish in their Arms. By THOMAS MOULE.

Nearly 600 Families are noticed in this work; and besides the several descriptions of Fish, Fishing-nets, and Boats, are included also Mermaids, Tritons, and Shell-fish. Nearly 70 Ancient Seals are described, and upwards of 20 subjects in Stained Glass. The Engravings, 205 in number, are from Stained-Glass, Tombs, Sculpture, and Carving; Medals and Coins; Rolls of Arms, and Pedigrees.—John Van Voorst, 1, Paternoster-row.

A new Edition, considerably improved and enlarged.

LOUDON'S ENCYCLOPÆDIA of GARDENING; the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape Gardening, including all the latest Improvements, a general view of Gardening in all Countries, and a Statistical View of its present State, with Suggestions for its future progress in the British Isles, &c. With nearly 1000 Engravings on Wood, 50s. boards.

II.

A New Edition, with SUPPLEMENT, of

LOUDON'S ENCYCLOPÆDIA of PLANTS; a Description of all the Plants in Great Britain, down to 1840, with nearly 10,000 Figures, by Branston, from Drawings by J. D. C. Sowerby, F.L.S. One thick vol. 8vo, 3l. 13s. 6d. cloth.

⁂ The SUPPLEMENT, edited by J. C. Loudon, prepared by W. H. Baxter, Jun., and revised by Geo. Don, F.L.S., with upwards of 800 additional Figures, separately, price 15s.

III.

LOUDON'S ENCYCLOPÆDIA of AGRICULTURE. Third Edition, with nearly 1300 Wood Engravings, one large vol. 8vo, price 2l. 10s. cloth lettered.

IV.

LOUDON'S HORTUS BRITANNICUS; a Catalogue of all the Plants indigenous to or introduced into Britain. New Edition, with a NEW SUPPLEMENT up to March 1839, prepared, under the direction of J. C. Loudon, by W. H. Baxter, and revised by Geo. Don, F.L.S., 8vo, price 1l. 11s. 6d. cloth lettered. SUPPLEMENT, separately, 8s.

London: Longman, Brown, Green, and Longmans.

IMPORTANT TO GARDENERS, &c.
Recently Published,

THE MEMORY SHEET of GARDEN WORK for Every Day in the Year, in the Kitchen, Fruit, and Flower Garden. By a Working Gardener. Carefully collated with the best Authorities. Price, mounted on cloth, in case, 2s. 6d.

"The Memory Sheet of Garden Work is a calendar in the form of a Sheet Almanac, pasted upon linen, and folded up like a map. It seems carefully prepared, and will be found a useful aid to the gardener."—*Gardeners' Chronicle, April* 17, 1841.

The ART of PROMOTING the GROWTH of the CUCUMBER and MELON, in a Series of Directions for the best means to be adopted in bringing them to a complete state of Perfection. By THOMAS WATKINS, many years foreman to Mr. Grange, of Hackney. New edition, 8vo. 3s. 6d., published at 7s.

"We can safely recommend this work to such amateurs as are their own gardeners: they will find the directions plain, concise, and well adapted to the end proposed; viz. ample crops of Cucumbers and Melons, both at the earliest and latest seasons at which these fruits are grown."—*Loudon's Gardeners' Mag.*, vol. 3. p. 332.

THE UNIVERSAL DIRECTORY for taking Alive and Destroying all kinds of Four-footed and Winged Vermin; comprising the Fox, Otter, Badger, Marten Cat, Pole Cat, Stoat, Weasel, Hedgehog, Rat, Mouse, Mole, Buzzard, Kite, Hawk, Owl, Crow, &c. &c., in a method hitherto unattempted; calculated for the use of Gentlemen, Farmers, and Warreners. By ROBERT SMITH. 12mo., new edition, carefully revised, with 6 plates of Traps, Cages, &c. 3s. 6d.

THE DIFFERENT MODES of CULTIVATING the PINE-APPLE, from its first Introduction into Europe to the late Improvements of T. A. Knight, Esq. By a distinguished Member of the Horticultural Society. With 24 wood-cuts, exhibiting the best plans of Pine Stoves and Pits. 8vo., 5s., originally published at 9s.

THE ORCHARDIST; or a System of Close Pruning and Medication for establishing the Science of Orcharding as patronised by the Society for the Encouragement of Arts and Sciences; containing Directions for Manuring, and the Preservation of Trees from Blight, Caterpillars, Canker, &c. By the late T. S. D. BUCKNALL, Esq., M.P. Second edition, 8vo. 2s. 6d., originally published at 5s.

⁂ For this work the author was rewarded with the Prize Medal of the above Society.

DIRECTIONS for CULTIVATING the CRAMBE MARITIMA, or SEA-KALE, for the USE of the TABLE. By WILLIAM CURTIS. New edition, enlarged, with 3 engravings, 12mo., 1s. 6d.

Henry Wright, Agricultural and Sporting Library, 51, Haymarket.
And all Booksellers.

SEASIDE.

TO be LET or SOLD, a genteel Detached COTTAGE RESIDENCE, Furnished or Unfurnished, with large Garden, on the Hampshire coast; with fine sea-views; and with or without Coach-house and Stable. Early possession may be had.—Apply for further particulars at the Office of Mr. W. Bromley, Gray's Inn-square; or to Mr. Turner, at the Library, Hayling, near Havant.

UPPER CLAPTON.—TO BE LET, a Genteel Cottage Residence, with good Garden, in STAMFORD GROVE. Apply to view at the Lodge, or at the Office of Mr. Wm. Bromley, Solicitor, Gray's Inn-square.

THE following communication (translated from the German) was addressed to Messrs. Rowland's Agent at Cologne:—

13, Straitz Euggasse, Cologne
May 23, 1841.

Mr. Th. S. Ditges,

Sir,—I have much pleasure in informing you of the extraordinary effects of "ROWLAND'S MACASSAR OIL." For about nine years I had not a particle of hair on my head, when I was casually recommended to give this celebrated Oil a trial; I accordingly purchased two bottles at your establishment, and strictly followed the printed directions: in the course of two months my head was covered with fine short hair, which I had cut off, and continued to persevere in the use of the Oil. The result is, that after five months' perseverance, I can now boast of as good a head of hair as any man in this city. In justice to the inventors I make this acknowledgment, and shall feel great pleasure in satisfying any inquiry.—I salute you with respect.

ADAM BAUER, 8th Artillery Brigade.

ROWLAND'S MACASSAR OIL prevents hair from falling off, or turning Grey; changes Grey Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

⁂ Ask for "ROWLAND'S MACASSAR OIL."

The LOWEST PRICE is 3s. 6d.; the next price is 7s.—10s. 6d., and 21s. per bottle.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, May 14, 1842.

Vines, Esq., F.H.S., for Herbaceous Calceolarias; 5, to Mr. Catleugh, of Hans-street, Chelsea, for Herbaceous Calceolarias; 6, to Mr. M'Conach, gr. to E. Vines, Esq., F.H.S., for Shrubby Calceolarias; 7, to Mr. Catleugh, of Hans-street, Chelsea, for Shrubby Calceolarias; 8, to Mr. Redding, gr. to Mrs. Marryat, F.H.S., for a large collection of Stove and Greenhouse Plants; 9, to Mr. Goode, gr. to Mrs. Lawrence, F.H.S., for a small collection of Stove and Greenhouse Plants; 10, to Mr. Clarke, gr. to T. Smith, Esq., of Shirley Park, Croydon, for a small collection of Stove and Greenhouse Plants; 11, to Mr. Barnes, gr. to G. W. Norman, Esq., F.H.S., for a small collection of Stove and Greenhouse Plants; 12, to Mr. Bruce, gr. to B. Miller, Esq., of Mitcham, Surrey, for a collection of six species of Stove and Greenhouse Plants; 13, to Mr. Fraser, of the Lea Bridge Road, for a collection of six species of Stove and Greenhouse Plants; 14, to Mr. Clarke, gr. to M. T. Smith, Esq., of Shirley Park, Croydon, for Stove and Greenhouse Climbers; 15, to Mr. Jackson, of Kingston, Surrey, for a small collection of Stove and Greenhouse Plants; 16, to Mr. Catleugh, of Hans-street, Chelsea, for a small collection of Stove and Greenhouse Plants; 17, to Mr. Paxton, gr. to his Grace the Duke of Devonshire, for a miscellaneous collection of Fruit; 18, to Mr. Judd, gr. to G. Knott, Esq., for Grapes; 19, to Mr. Wilmot, of Isleworth, for Grapes; 20, to Mr. J. Toy, gr. to R. Alston, Esq., F.H.S., for Pine Apples; 21, to Mr. Falconer, gr. to A. Palmer, Esq., of Cheam, Surrey, for Greenhouse Azaleas; 22, to Mr. Jackson, of Kingston, Surrey, for Greenhouse Azaleas; 23, to Mr. Green, gr. to Sir E. Antrobus, Bart., F.H.S., for six species of Cape Heaths; 24, to Mr. Barnes, gr. to G. W. Norman, Esq., F.H.S., for Tall Cacti in flower; 25, to Mr. Barnes, gr. to G. W. Norman, Esq., F.H.S., for six species of Orchidaceous Plants; 26, to G. Barker, Esq., F.H.S., of Birmingham, for Phalænopsis amabilis; 27, to Mr. Jackson, of Kingston, Surrey, for Erica elegans; 28, to Mr. R. May, gr. to E. Goodheart, Esq., of Beckenham, Kent, for Erica aristata major; 29, to Mr. Falconer, gr. to Archdale Palmer, Esq., for Leschenaultia formosa; 30, to Mr. Paxton, gr. to his Grace the Duke of Devonshire, for Rhododendron Gibsoni.

THE SILVER KNIGHTIAN MEDAL.—1, To Mr. Bromley, gr. to Miss Anderdon, of Farlie Park, Reading, Berks, for a large collection of Pelargoniums; 2, to Mr. Slow, gr. to W. Baker, Esq., of Bayfordburgh, Herts, for a large collection of Pelargoniums; 3, to Mr. Kyle, gr. to R. Barclay, Esq., for a collection of six species of Stove and Greenhouse Plants; 4, to Mr. J. Loudon, gr. to S. Gurney, Esq., of West Ham, Essex, for Grapes; 5, to Mr. G. Wortley, gr. to J. F. Maubert, Esq., F.H.S., for Grapes; 6, to Mr. Chapman, of Vauxhall, for Grapes; 7, to Mr. M. Henderson, gr. to Sir G. Beaumont, Bart., for Elruge Nectarines; 8, to Mr. Barnes, gr. to G. W. Norman, Esq., F.H.S., of Bromley Common, for Greenhouse Azaleas; 9, to W. H. Story, Esq., F.H.S., for six species of Cape Heaths; 10, to Mr. Pawley, of the White Hart Inn, Bromley, Kent, for six species of Cape Heaths; 11, to Mr. Paxton, gr. to his Grace the Duke of Devonshire, for six species of Orchidaceous Plants; 12, to Mrs. Wray, F.H.S., for Cattleya Skinneri; 13, to Mr. Paxton, gr. to his Grace the Duke of Devonshire, for Dendrobium Devonianum; 14, to Mr. Green, gr. to Sir E. Antrobus, Bart., F.H.S., for Erica Hartnelli; 15, to Mr. Bruce, gr. to B. Miller, Esq., for Helichrysum humile; 16, to Mr. Clarke, gr. to M. T. Smith, Esq., of Shirley Park, Croydon, for Leschenaultia formosa; 17, to Mr. Green, gr. to Sir E. Antrobus, Bart. F.H.S., for Tropæolum tricolor; 18, to Mr. Donald, of Woking, Surrey, for Hardy Azaleas; 19, to Mr. Willmer, of Sunbury, Midd., for Tulips.

THE SILVER BANKSIAN MEDAL.—1, To Mr. Gaines, of Battersea, for Shrubby Calceolarias; 2, to Mr. Tillery, gr. to his Grace the Duke of Portland, for a miscellaneous collection of Fruit; 3, to Mr. Clarke, gr. to M. T. Smith, Esq., of Shirley Park, Croydon, for a miscellaneous collection of Fruit; 4, to Mr. M. Henderson, gr. to Sir G. Beaumont, Bart., for Grapes; 5, to Mr. J. Dodds, gr. to Sir G. Warrender, Bart., F.H.S., for Pine Apples; 6, to R. Brook, Esq., F.H.S., for Apples and Pears; 7, to Mr. Hardie, gr. to J. Jarrett, Esq., F.H.S., for an early Cantaloup Melon; 8, to Mr. Paxton, gr. to his Grace the Duke of Devonshire, for May Duke Cherries; 9, to Mr. Bruce, gr. to B. Miller, Esq., for Polygala oppositifolia; 10, to Mr. Fraser, of the Lea Bridge Road, Layton, for Epacris grandiflora: 11, to Mr. Green, gr. to Sir E. Antrobus, Bt., F.H.S., for Helichrysum humile; 12, to Mr. Hardie, gr. to J. Jarrett, Esq., F.H.S., for Saccolabium guttatum.

THE CERTIFICATE OF MERIT.—1, To Mr. M'Farlane, gr. to J. R. Mills, Esq., of Stamford Hill, for Cucumbers; 2, to Mr. Chapman, of Brentford, for Potatoes; 3, to Mr. Baldwin, of Turnham Green, for Apples; 4, to Mr. Farnes, of St. John Street, for Chappell's Cream Broccoli; 5, to Mr. Barnes, gr. to G. W. Norman, Esq., F.H.S., for Podolobium trilobum; 6, to Mr. Croucher, gr. to J. Allcard, Esq., of Stratford Green, Essex, for Azalea variegata; 7, to Mr. Green, gr. to Sir E. Antrobus, Bart., F.H.S., for Tropæolum sp.; 8, to Mr. Kyle, gr. to R. Barclay, Esq., for Bossiæa sp.; 9, to Mr. Barnes, gr. to G. W. Norman, Esq., F.H.S., for Columnea Schiediana; 10, to J. Allnutt, Esq., F.H.S., for Zichya coccinea; 11, to Mr. Redding, gr. to Mrs. Marryat, F.H.S., for Clematis azurea; 12, to Mr. Green, gr. to Sir E. Antrobus, Bt., F.H.S., for Azalea Gledstonesii: 13, to Mr. Standish, Nurseryman, of Bagshot, for Calceolaria Standishii; 14, to Mr. Green, gr. to Sir E. Antrobus, Bart., F.H.S., for Ne plus ultra; 15, to Mr. Gaines of Battersea, for Amulet Pelargonium; 16, to the Rev. R. Garth, of Farnham, Surrey, for Symmetry Pelargonium; 17, to Mr. Willmer, of Sunbury, Middlesex, for Prince of Wales's Tulip.

FLORICULTURAL SOCIETY of LONDON.—The Tulip and Heartsease Show of this Society will take place on Tuesday next, the 24th inst., when, in addition to prizes for collections and single blooms, as many first and second-class prizes will be awarded to seedling Tulips and Heartsease as there are flowers produced deserving of them. The flowers to be ready by 12 o'clock, and visitors admitted at 2 o'clock, upon tickets obtained from the members.—T. C. WILDMAN, Hon. Sec.

Grove Place, Southampton-street, Camberwell.

CHRYSANTHEMUMS. — CHANDLER AND SONS, Nurserymen, Vauxhall, London, beg to state that they have good plants, in small pots, of their CHRYSANTHEMUMS now ready to send out, and that they can supply the Jersey varieties at 12s. per dozen, different sorts, and also the French and Spanish varieties at 18s. per dozen.

A list of their collection may be had on application; if by letter, prepaid.

DAHLIAS.—In consequence of the decease of Mr. A. HILLIER, the whole of his STOCK of DAHLIAS, embracing nearly all the best Show Plants now out, with the remainder of the Stock of his Seedling Dahlia SIR FREDERICK JOHNSTONE, is now to be disposed of at a great sacrifice, either together or in small lots.—For particulars apply to Mr. Hobbs, 23, St. Giles's-street, Oxford.

NEW AND SUPERB FUCHSIAS.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the NEW FUCHSIAS sent out by various parties, which they have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they are now ready to be sent out at the rate of 21*s*. per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post-free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, May 19th, 1842.

AMERICAN TREE AND SHRUB SEEDS.

J. AND C. WHALLEY, Seed and Nursery men, St. George's Crescent, Liverpool, beg to intimate to the Trade, that having a small portion of an extensive Consignment of some very Choice Sorts of the above remaining still on hand, and being anxious to close the account, they will dispose of them at a reduced rate. Catalogues and prices may be had on application.

ARAUCARIA IMBRICATA.

MESSRS. W. and F. YOUELL beg respectfully to inform the Nobility and Gentry who are desirous of enriching their Arboretums and Plantations with this truly ornamental and hardy tree, that they are offering fine strong Plants, 2 years old, from seed, in pots, at 63*s*. per dozen, or 25*l*. per 100, which they will warrant perfectly hardy, having had several hundred standing fully exposed to the severity of the late winter, without receiving the slightest detriment, in a situation completely open to the north-easterly gales, and within 500 yards of the wash of the sea.

Those who are unacquainted with the habit and description of the above can obtain an engraving, taken from a plant in the Arboretum of the Earl of Orford, together with a description, by enclosing 4 postage stamps.

CEDRUS DEODORA.

Fine Plants of this elegant and ornamental hardy tree may also be obtained of Messrs. W. and F. Y., at the following prices :

3 years old, from seed, 9 to 11 inches, 84*s*. per dozen.
2 „ „ 5 to 7 „ 63*s*. „

Great Yarmouth Nursery, Norfolk, May 19, 1842.

UNION ROAD NURSERIES, PLYMOUTH.

WILLIAM E. RENDLE respectfully informs the Nobility, Gentry, and the Trade, that he has a few plants left of that favourite Geranium

LYNE'S CIRCASSIAN,

which has gained for itself, by every Florist who has seen it, a first-rate character. Good strong plants, in 60-sized pots, 42*s*. each.

Lyne's Consort, 21*s*. each.
„ Magnificent, 21*s*. „

Lyne's Princess Royal, and Bassett's Glory of the West, (of which W. E. R. possesses the entire stock,) cannot be sent out till about July next, in consequence of the numerous applications for it.

Veitch's Fair Maid of Devon, (just sent out,) 63*s*. each.
Pansy.—Fox's Cornish Gem, 10*s*. 6*d*. each.
Rosa Devoniensis, good strong plants, 7*s*. 6*d*. each.
Auraucaria Imbricata, in 48-sized pots, 6*s*. 6*d*. each.

W. E. R.'s General Spring Catalogue of Geraniums, Dahlias, Calceolarias, Pansies, Herbaceous Plants, &c. (which contains descriptions of the above-named plants,) can be had on prepaid application.

Agents in London: Messrs. Warner, Seedsmen, Cornhill; M.W. Bristow, Knightsbridge; through whom plants of any of the above may be procured.—Plymouth, April 25th, 1842.

GIOVANNI MARSANO has just received from his country, GENOA, now landed, 150 ORANGE, CITRON, and LEMON TREES, and 5 VINES; Nurserymen will be supplied at 5*s*. to 10*s*. each tree. 300 CATALONIAN JASMINE PLANTS, at 40*s*. per 100. These splendid Trees may be seen, and orders will be thankfully received, at G. Marsano's, Oilman, Seedsman, and Florist, No. 2, Beauchamp street, Brook's Market, Leather-lane, Holborn, London.

W. WATSON, Nurseryman, Seedsman, and Florist, St. ALBANS (and Tyttenhanger Nursery, adjoining Colney Heath), Son and Successor to the late Mr. DAVID WATSON, respectfully begs to inform the Nobility, Gentry, and the Trade in general, that he intends carrying on the Business of NURSERYMAN, &c., as above; and earnestly solicits a continuance of the favours so long bestowed on his respected Father.

N. B. All persons having claims on the Estate of the late Mr. David Watson, are requested to send in their Accounts to the Administrator, WM. WATSON.

St. Albans, May 18, 1842.

CHEAP SHOWY PLANTS FOR FLOWER-BEDS.

WILLIAM BARRATT begs to offer to Floriculturists, as below, CALCEOLARIAS, GERANIUMS, VERBENAS, FUCHSIAS, PANSIES, DAHLIAS, and other free-blooming Garden Flowers, at 4*s*. to 6*s*. per dozen; strong Plants ready for planting out. A fine collection of the above plants in named sorts, as well as other Greenhouse and Herbaceous plants for Rooms and Greenhouses.

About 10,000 GREENHOUSE HEATHS and EPACRISES, in fine health; worthy the attention of the Amateur and Nurseryman.

*** NATURAL GRASSES for permanent pasture, in selected sorts. Persons ordering these should give the quantity of ground, the situation and quality of the soil, and for what purpose wanted; doing this they may rely on having the proper kinds, and at not above one-third more expense than the old mixtures of Hay-seeds, which are very uncertain in producing good Herbage. Also, DWARF LAWN GRASSES; as much seed as will sow 100 square yards for from 3*s*. to 4*s*.

Wakefield Nursery, May 1842.

CHAPMAN'S NEW SPRING POTATOES.—This excellent new variety, possessing all the qualities of the best Ash-leafed Kidney, but capable of being produced in perfection for table from November till June, is now ready for delivery at One Guinea per bushel, with directions for their culture in the open ground without protection.

"We never yet tasted any forced or retarded Potatoes anything like so good."—Dr. Lindley, in *Gardeners' Chronicle*.

"We can only repeat, that, be they what they may, they are of excellent quality."—Dr. Lindley, in *Gardeners' Chronicle*, Apr. 2.

*** Orders for sample baskets, enclosing 1*s*., will be attended to; but orders for sets must be prompt—addressed to T. H. Chapman, Brentford-end.

FLOWER PROPS, of Wrought Iron, made upon an approved principle, in lengths of 2 ft. to 8 ft. Also, Garden Engines, Greenhouse Syringes, improved Watering Pots, Fumigating Bellows, Grass and Border Shears, Pruning Knives and Shears, and all other Horticultural Implements, upon the most advantageous terms, at Tendell and Edwards's, Wholesale and Retail Ironmongers, 46, Leadenhall-street, London.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to PUBLIC AUCTION, at the Mart, Bartholomew-lane, on TUESDAY, May 24th, THURSDAY 26th, and following day, at 12 o'clock, about 2,000 of the most approved DAHLIAS, Splendid GERANIUMS, New FUCHSIAS, VERBENAS, &c. &c.

May be viewed the Morning of Sale.

Catalogues may be had at the Mart, and at the Auctioneers', Leytonstone.

THE BOTANICAL MUSEUM of the late A. B. LAMBERT, Esq.

MR. S. LEIGH SOTHEBY, AUCTIONEER OF LITERARY PROPERTY, of Wellington-street, Strand, has received instructions from the Executor to announce, that on Monday, June 27, and two following days, he will SELL BY AUCTION, THE HIGHLY VALUABLE BONANICAL MUSEUM of the late A. B. LAMBERT, Esq., of Boyton-House. Wiltshire, &c. These most extensive and interesting Collections have been accumulating for more than half a century, regardless of expense, and comprise :—

1st. DRIED PLANTS, in separate collections, to the extent of above One Hundred, described and distinct Herbaria.

2d. FRUITS, dry or preserved in spirits and acids. These are very numerous, and form together by far the largest Carpological Collection ever made by a private botanist.

3d. WOODS, in entire or partial stems, with sections of barks, &c.

To give a few particulars of the various Collections of Dried Plants, in anticipation of the descriptive Catalogue now preparing, it is sufficient to state they include those, or portions of them, which have been brought home by the various circumnavigators and travellers :—

Afzelius
Brown
Clark
Cripps
Forster
Hamilton
Labillardière
Menzies
Russell
Salt
Sir G. Staunton
Lord Valentia

The more recent Collections were made by

Bridges
Caley
Claussen
Cuming
Cunningham
Douglas
Fischer.
Gillies
Hartweg
Kotschy
Macrae
Matthews
Nuttall
Pursh
Schimper
Schiede
Sello
Sieber

And among the larger and more important Collections will be found those of

The Earl of Bute
Cavanilles
Hudson
Martin
Moçino & Sesse
Pallas
Roxburgh
Wallich
&c. &c.

And above all that most extensive and valuable one of Ruiz and Pavon; together with the fine series of Fruit and Seed Vessels which accompany them; also the Cabinets which contained them, which are of the best manufacture in Mahogany and Cedar Wood.

The Sale will take place at 26, LOWER GROSVENOR STREET, the Residence of the late Mr. Lambert, and Catalogues will be ready on the 1st of June, and may be obtained at the place of Sale, and at the Offices of Mr. S. Leigh Sotheby, Wellington-street, Strand; also at Paris of Fortin, Masson, and Co.; Hamburgh, Perthes, Besser, and Mauke; Berlin, Aug. Krantz & Cie.; Vienna, F. Rauch, Schönbrunn; Rotterdam, Dr. Miguel.

MAGNIFICENT COLLECTION OF ORCHIDACEOUS PLANTS.

WE are authorised to announce the intention of Mr. HARRISON of Liverpool to dispose of his entire collection of ORCHIDACEOUS PLANTS, in consequence of his being about to leave his present residence. This affords an opportunity, which seldom occurs, for the immediate acquisition of a very large number of the finest species of these brilliant plants, in excellent condition. Mr. Harrison was one of the first to cultivate such plants; his intercourse with South America has enabled him to acquire many species of great rarity, and, from the length of time that they have been in his possession, many of the specimens are, it is believed, unrivalled for size. Any one desirous of treating for the purchase of the entire collection must apply by letter to Richard Harrison, Esq., Aighburgh, Liverpool.

TO FLORISTS, AND OTHERS.

TO BE LET, a COTTAGE and a very desirable PLOT of GROUND, containing about one Acre, enclosed by a brick wall all round, having three large Greenhouses, (one a double one,) Nine Ranges of Brick Pits, Stable, and Cart-house, &c. thereon, held on Lease,—and nothing of the kind in the neighbourhood. The Greenhouses, Pits, &c. to be taken at a valuation. For further particulars apply on the premises, Chester Gardens, near Chester-street, Kennington Cross.

BRITANNIA LIFE ASSURANCE COMPANY,

1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l.* for whole term of Life.

Age.	Annual Premium payable during 1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.

PETER MORRISON, Resident Director.

A liberal commission allowed to Solicitors and Agents.

NEW ZEALAND COMPANY.—NOTICE IS HEREBY GIVEN, that the ANNUAL GENERAL COURT OF PROPRIETORS OF THE NEW ZEALAND COMPANY will be holden on TUESDAY the 31st day of MAY inst., at One o'clock precisely, at this House, for the election of Directors and other Officers of the said Company, and for the transaction of other business. At the said Meeting, the following Directors will go out of office, viz.—

Viscount INGESTRE, M.P.
Sir WILLIAM MOLESWORTH, Bart.
ARTHUR WILLIS, Esq.
JOHN ELLERKER BOULCOTT, Esq.
JOHN WILLIAM BUCKLE, Esq.
HENRY AGLIONBY AGLIONBY, Esq., M.P.

But being eligible for re-election, hereby offer themselves to be re-elected accordingly. By order of the Court,

JOHN WARD, Secretary.

New Zealand House, Broad-street Buildings, 13th May, 1842.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronised their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l.* 5*s.* and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s.* 3*d.*, 3*s.* 3*d.*, and 4*s.* 3*d.* per yard.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

W. DAVIS, 34, Wych-street, Strand, London, begs to inform the Nobility, Gentry, and Horticulturists, that he has adopted A SYSTEM FOR HEATING FORCING-HOUSES and other Buildings by HOT WATER, upon the most Simple, Efficient, and Economical principle. As a proof, he will refer them to his work completed for the Most Noble the Marquis of Salisbury; Sir Simon Clarke, Bart., Oak Hill, Barnet; Abel Smith, Esq. M. P., Woodhale, Herts, &c.

All orders conferred upon him will be punctually attended to.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing, upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass, supplied in any number or quantity, at wholesale prices.

This day is published, in 8vo, price 5s.,

ON the GROWTH of PLANTS in CLOSELY-GLAZED CASES. By N. B. WARD, F.L.S.

John Van Voorst, 1, Paternoster Row.

COMIC NURSERY TALES.

Just ready, in a rich ornamental cover, gilt edged, small 4to, price 2s. 6d.,

BLUE BEARD; being the first of a series of Comic Nursery Tales. By F. W. N. BAYLEY, Author of "The New Tale of a Tub." Illustrated with Engravings Humorous and Numerous.

W. S. Orr and Co., Amen Corner, Paternoster Row,
In the Press,
LITTLE RED RIDING-HOOD; and the SLEEPING BEAUTY,

This day is published, price 6*s.* 6*d.*,

SEVEN LITHOGRAPHED DESIGNS for the IMPROVEMENT of FARM COTTAGES and STEADINGS, with Description, Specifications, and Estimates; Remarks on the Accommodation required under the Modern System of Husbandry, and the Defects of existing Farm Buildings. Accompanied by an Appendix of Practical Information on a variety of subjects connected with such Erections; the Use of Home and Foreign Timber; the Moving Powers applicable to Thrashing Machines, &c. By JAMES CUNNINGHAM, Surveyor, Greenlaw.

William Blackwood and Sons, 45, George-street, Edinburgh, and 22, Pall Mall, London; and sold by all Booksellers.

BOTANY, GEOLOGY, AND ORNITHOLOGY.

In small 8vo. with Woodcuts and Plates, price 4*s.* 6*d.* each.

MANUALS OF NATURAL HISTORY:

By PROFESSOR MACGILLIVRAY, Marischal College, Aberdeen.

A MANUAL of BOTANY; comprising Vegetable Anatomy and Physiology; or, an account of the Structure and Functions of Plants; with an outline of the Linnæan and Natural Systems, and a Glossary of Terms and Index. Woodcuts and 214 engraved Figures.

2.—A MANUAL of GEOLOGY, with Woodcuts and coloured Geological Map of England.

3.—A MANUAL of BRITISH ORNITHOLOGY: being a short description of the Birds of Great Britain and Ireland, including the essential characters of the species, genera, families, and orders. Part I. containing the Land Birds, with an Introduction explanatory of the particulars requisite to compare the objects with their descriptive characters; and 31 Woodcuts.

4.—A MANUAL of BRITISH ORNITHOLOGY: Part II., containing the Waders and Water Birds. *Just published.*

"The author has executed his undertaking with great care. His style is clear and full; there is nothing omitted which can be considered essential to the subject; and the whole series may be commended as admirable text-books for students."—*Atlas.*

London: Scott, Webster, and Geary, Charterhouse Square.

BOTANY.

With four beautifully-coloured steel-plate figures, and sixteen wood-cut Miniatures of the most interesting plants for Garden culture.

Publishing monthly, large, 1s. 6d.; small, 1s.,

THE BOTANIC GARDEN; or Magazine of hardy Flowering Plants; by B. MAUND, F.L.S. Each number contains four finely-coloured figures of Ornamental Plants selected for their beauty and utility in the decoration of the open Flower Garden and the Shrubbery; with a popular Historical Description of them, account of their Habits, and Instructions for their Culture. Each number contains also the FLORAL REGISTER, with sixteen miniature Cuts of the rarest Plants, and a detailed account of each; and the AUCTARIUM, being a register of interesting information on Gardening, &c.

No 210 of the Botanic Garden will be published on the 1st of June, and will contain Indices to the first Parts of the Floral Register and Auctarium, which now form a handsome volume; and a continuation of them is still given in each successive No.

The first 8 volumes of the Botanic Garden may now be had complete in boards, at 37*s.* per vol. large, and 25*s.* small, without extra charge for the 9th vol., comprising the Floral Register and Auctarium, and which contains nearly 1200 finely executed Woodcuts of Plants.

London: Simpkin and Marshall, and Sherwood and Co.

NURSERY FOREMAN.

WANTED in an old-established Nursery near London a GROUND FOREMAN, who would be competent to undertake the management of a general Nursery Stock. He must be well acquainted with the propagation of Trees and Shrubs, Fruit Trees, &c. be able to write a good hand, and give the most satisfactory reference as to character and abilities; where last employed, &c. No person need apply whose abilities and good conduct will not bear the strictest investigation. A middle-aged married man would be preferred. Address, prepaid, Z. Y., at the office of the *Gardeners' Chronicle*, Charles-st., Covent-garden.

A GENTLEMAN who is about to leave the Country wishes to procure a situation for his Gardener. Any gentleman who is in want of a steady, industrious, and experienced Gardener, will find him an acquisition. Address A. Z., Mr. Dawson, Nurseryman, Brixton Hill, or Messrs. T. and C. Lockhart, 156, Cheapside.

HOUSE AND LAND STEWARD, or EITHER.—The Advertiser having recently retired from a Public Situation, is desirous of Engaging with a Nobleman or Gentleman in the above capacity, for which he is well qualified, and can be strongly recommended.

Letters to be addressed to Mr. Green, 6, Richmond Buildings, Soho.

WANTS a SITUATION as GARDENER, an Industrious Single Man, between 30 and 40 years of age, who has lived for some years with a distinguished Horticulturist, where every branch of the business has been carried to the highest state of cultivation. Would not object to the superintendence of a respectable nursery, being thoroughly acquainted with the propagation and cultivation of Exotics, Florist-flowers, &c. Address, H. B., No. 1, Melbourn-place, St. John's-wood-road, Maida Hill.

WANTS a SITUATION as GARDENER, a Married Man, 32 years of age, who has lived in some of the first Noblemen's establishments in England, has been very successful in Forcing Pines, Grapes, Peaches, &c., as also in the cultivation of Stove and Greenhouse plants. Can be highly recommended by some of the first Horticulturists of the day, whom he has formerly lived under, as well as the gentleman he has just left, who will be very happy to answer satisfactorily the fullest inquiries of any nobleman or gentleman. Address W. H. R., Mr. Forrest's Nursery, Kensington.

WANTS a SITUATION as GARDENER, a Single Man, aged 28. Can have an undeniable character from a Gentleman he lived with four years. Personal reference can be obtained from a gentleman in town if requisite. No single-handed place will be taken. Direct to A.B., Post-Office, Stoke Newington, Middlesex.

WANTS a SITUATION as GARDENER, a person who from long experience is capable of conducting all the different departments of his Profession, such as Forcing, Pleasure, and Kitchen Gardening; the management of Hot and Greenhouse Plants and Flower-Garden. Can have a good character from his last place, where he lived five years. A line addressed, pre-paid, to Y. Z., at the Gardeners' Society, Mr. Lidgard's, Hammersmith, will meet with attention.

TO NOBLEMEN AND GENTLEMEN.

WANTS A SITUATION as GARDENER.—A Married Man, aged 37, of first-rate abilities, is desirous of obtaining a situation in the above capacity. He perfectly understands the management of Pines, Vines, Peaches, and Apricots; also the Forcing of Raspberries, Figs, Lettuces, French Beans, and Cauliflowers, during all the winter months, together with every kind of Early Forcing; also the Kitchen, Flower-garden, and Wood Plantations. Can have the highest testimonials for sobriety, &c. from the situation he last lived in, also from the most eminent authority in the kingdom.—Address G. H. N., care of Mr. Cole, 21, Liquorpond-street, London,—which will meet with immediate attention.

Twenty-first Edition, edited by a Lady of Rank. Handsomely printed in fcp. 8vo, 2s. 6d. cloth gilt,

HINTS on ETIQUETTE and the Usages of Society; with a Glance at Bad Habits. By Αγωγός.

21st edition, thoroughly revised, with Alterations and Additions, by a LADY OF RANK.

London: Longman, Brown, Green, and Longmans.

In 12mo, cloth boards, price 4s., 2d edition, enlarged, with additional Illustrations,

THE BEE-KEEPER'S MANUAL; or Practical Hints on the Management and complete Preservation of the Honey Bee. By HENRY TAYLOR.

London: Richard Groombridge, 6, Panyer-alley, Paternoster-row.

BRITISH BOTANY.

Fifth Edition, with 155 Figures, 12mo, price 10*s.* 6*d.*

WITHERING'S BRITISH PLANTS: corrected and condensed; preceded by Instructions adapted for Persons commencing the Study of Botany. By W. MACGILLIVRAY, A.M., Professor of Natural History in the Marischal College and University of Aberdeen.

This work contains familiar descriptions of all the indigenous Flowering Plants of Great Britain, Ireland, and the Channel Islands, so full as to enable the young botanist to determine every species he may meet with, without the assistance of others.

London: Scott, Webster and Geary, Charterhouse-square.

SIDNEY HALL'S COLOMBIER ATLAS,

corrected to 1841.

Half-bound in russia, 9*l.* 9*s.* folded in half; full size, 10*l.*,

A NEW GENERAL ATLAS of Fifty-three Maps, on Colombier Paper. Constructed entirely from New Drawings, and engraved by SIDNEY HALL. New Edition.

This is a new Edition of Sidney Hall's *original large Atlas*, very carefully corrected throughout: all the New Roads on the Continent are introduced, and several of the Maps have been entirely re-engraved.

London: Longman, Brown, Green, and Longmans.

This day, Post Octavo, 5*s.*

PRACTICAL CHEMISTRY for FARMERS and LANDOWNERS. By JOSHUA TRIMMER, F.G.S.

By the same Author, Octavo, with 200 Illustrations, 12s.,

PRACTICAL GEOLOGY and MINERALOGY, and the CHEMISTRY of METALS, with an Introductory Discourse on the Nature, Tendency, and Advantages of Geological Pursuits.

London: John W. Parker, West Strand.

Sixth Edition, 8vo, with 10 Plates, 15s. cloth,

SIR HUMPHRY DAVY'S AGRICULTURAL CHEMISTRY. With Notes by Dr. JOHN DAVY.

CONTENTS.

Introduction—The General Powers of Matter which influence Vegetation—The Organisation of Plants—Soils—Nature and Constitution of the Atmosphere, and its Influence on Vegetables—Manures of Vegetable and Animal Origin—Manures of Mineral Origin or Fossil Manures—Improvement of Lands by Burning—Experiments on the Nutritive Qualities of Different Grasses, &c.

London: Longman, Brown, Green, and Longmans.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.

The Second Exhibition will take place on Saturday, the 11th of June. Subjects for Exhibition must be at this Office on Friday, the 10th of June, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition. The Gates will be opened at One, P.M.—Tickets are issued to Fellows at this Office, price 5*s*. each; or at the Garden in the afternoon of the days of Exhibition at 10*s*. each; but none will be issued without an order from a Fellow of the Society.—21, Regent-street.

AT the suggestion and request of many Country Gentlemen, Mr. PAXTON'S COTTAGERS' GARDEN CALENDAR has been reprinted in the form of a small volume, for general distribution. The price is 3*d*. each copy; and it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s*. for every 25 copies required.

COUNTRY SHOWS.—May 24, Royal Berkshire. 25, Norwich. 26, Ipswich Cucumber. 27, Roxburghshire.

WE refer our readers to a full report in another part of our Paper for information concerning the first of the great exhibitions by the Horticultural Society on Saturday last. Shortly after 12 o'clock, the Queen and Prince Albert honoured the garden by a visit. His Grace the Duke of Devonshire, President, and Sir Charles Lemon, one of the Vice-Presidents, received the Royal party, and conducted them through the tents; after which, Her Majesty was graciously pleased to express her great admiration of the beautiful flowers, and her satisfaction at the general arrangements on the occasion. It is about seventeen years since the Queen was in the garden before.

With regard to the exhibition itself, we doubt whether on any former occasion there have been so many instances of high cultivation, or, upon the whole, so rich and varied a display of brilliant flowers. This is in our eyes a far more important fact than the gathering together of varieties and novelties, because it shows that the legitimate purpose of the Society—that of promoting good gardening—is really attained by the kind of encouragement held out to the public on these days.

A critical eye might, indeed, have discovered the absence of some of the Orchidaceous flowers produced on former occasions; but who could have regretted that plants, to be cultivated only by the most wealthy in the land, should have been replaced by magnificent Azaleas, and other greenhouse shrubs, which everybody who has a greenhouse has the means of growing in similar perfection?

WE have so often occupied the attention of our readers with the subject of Asparagus, that it would seem as if little more remained to be said. It is, however, too excellent a vegetable, and its good qualities are so much impaired by the ordinary modes of growing it, that—for ourselves, at least—every new fact connected with it is interesting. We therefore make no scruple about mentioning the following method of growing Asparagus at Nice, of which we have just heard a high account, but of which we have no personal knowledge. Now is the season for trying the experiment, and we trust that some of our correspondents will put it in practice.

Take a quart wine bottle, such as French wine is sold in; invert it over the head of an Asparagus just rising above the ground, and secure it by three sticks, so that it cannot be knocked over. If left in this state, the Asparagus will grow up into the interior of the bottle, and being stimulated by the unusual heat and moisture it is there exposed to, will speedily fill it. As soon as this has taken place, the bottle must be broken, and the Asparagus removed, when it will be found to have formed a thick head of tender delicate shoots, all eatable, and as compact as a Cauliflower.

A LATE number of "Paxton's Magazine of Botany" contains some very judicious observations upon the formation of a "conservative" wall, that is to say, a wall on which greenhouse plants, and those which are not sufficiently hardy to bear the open air without artificial warmth, may be successfully cultivated without the cost of erecting and maintaining a greenhouse. We have long entertained the opinion that the ugly glazed sheds called greenhouses, with which gardens are now so profusely disfigured, will one day be unknown where ornament is regarded, and that some better mode of enabling the plants of temperate countries to endure our winters will be devised. A conservative wall, in part, fulfils our expectations, for it offers a sure safeguard to many tender species, and at the same time adds a delightful feature to the flower-garden, exhibiting delicate exotics flourishing in the open air all the summer long. We are sorry, however, that we have not room for all Mr. Paxton's observations upon this subject; but the following will convey an idea of his views.

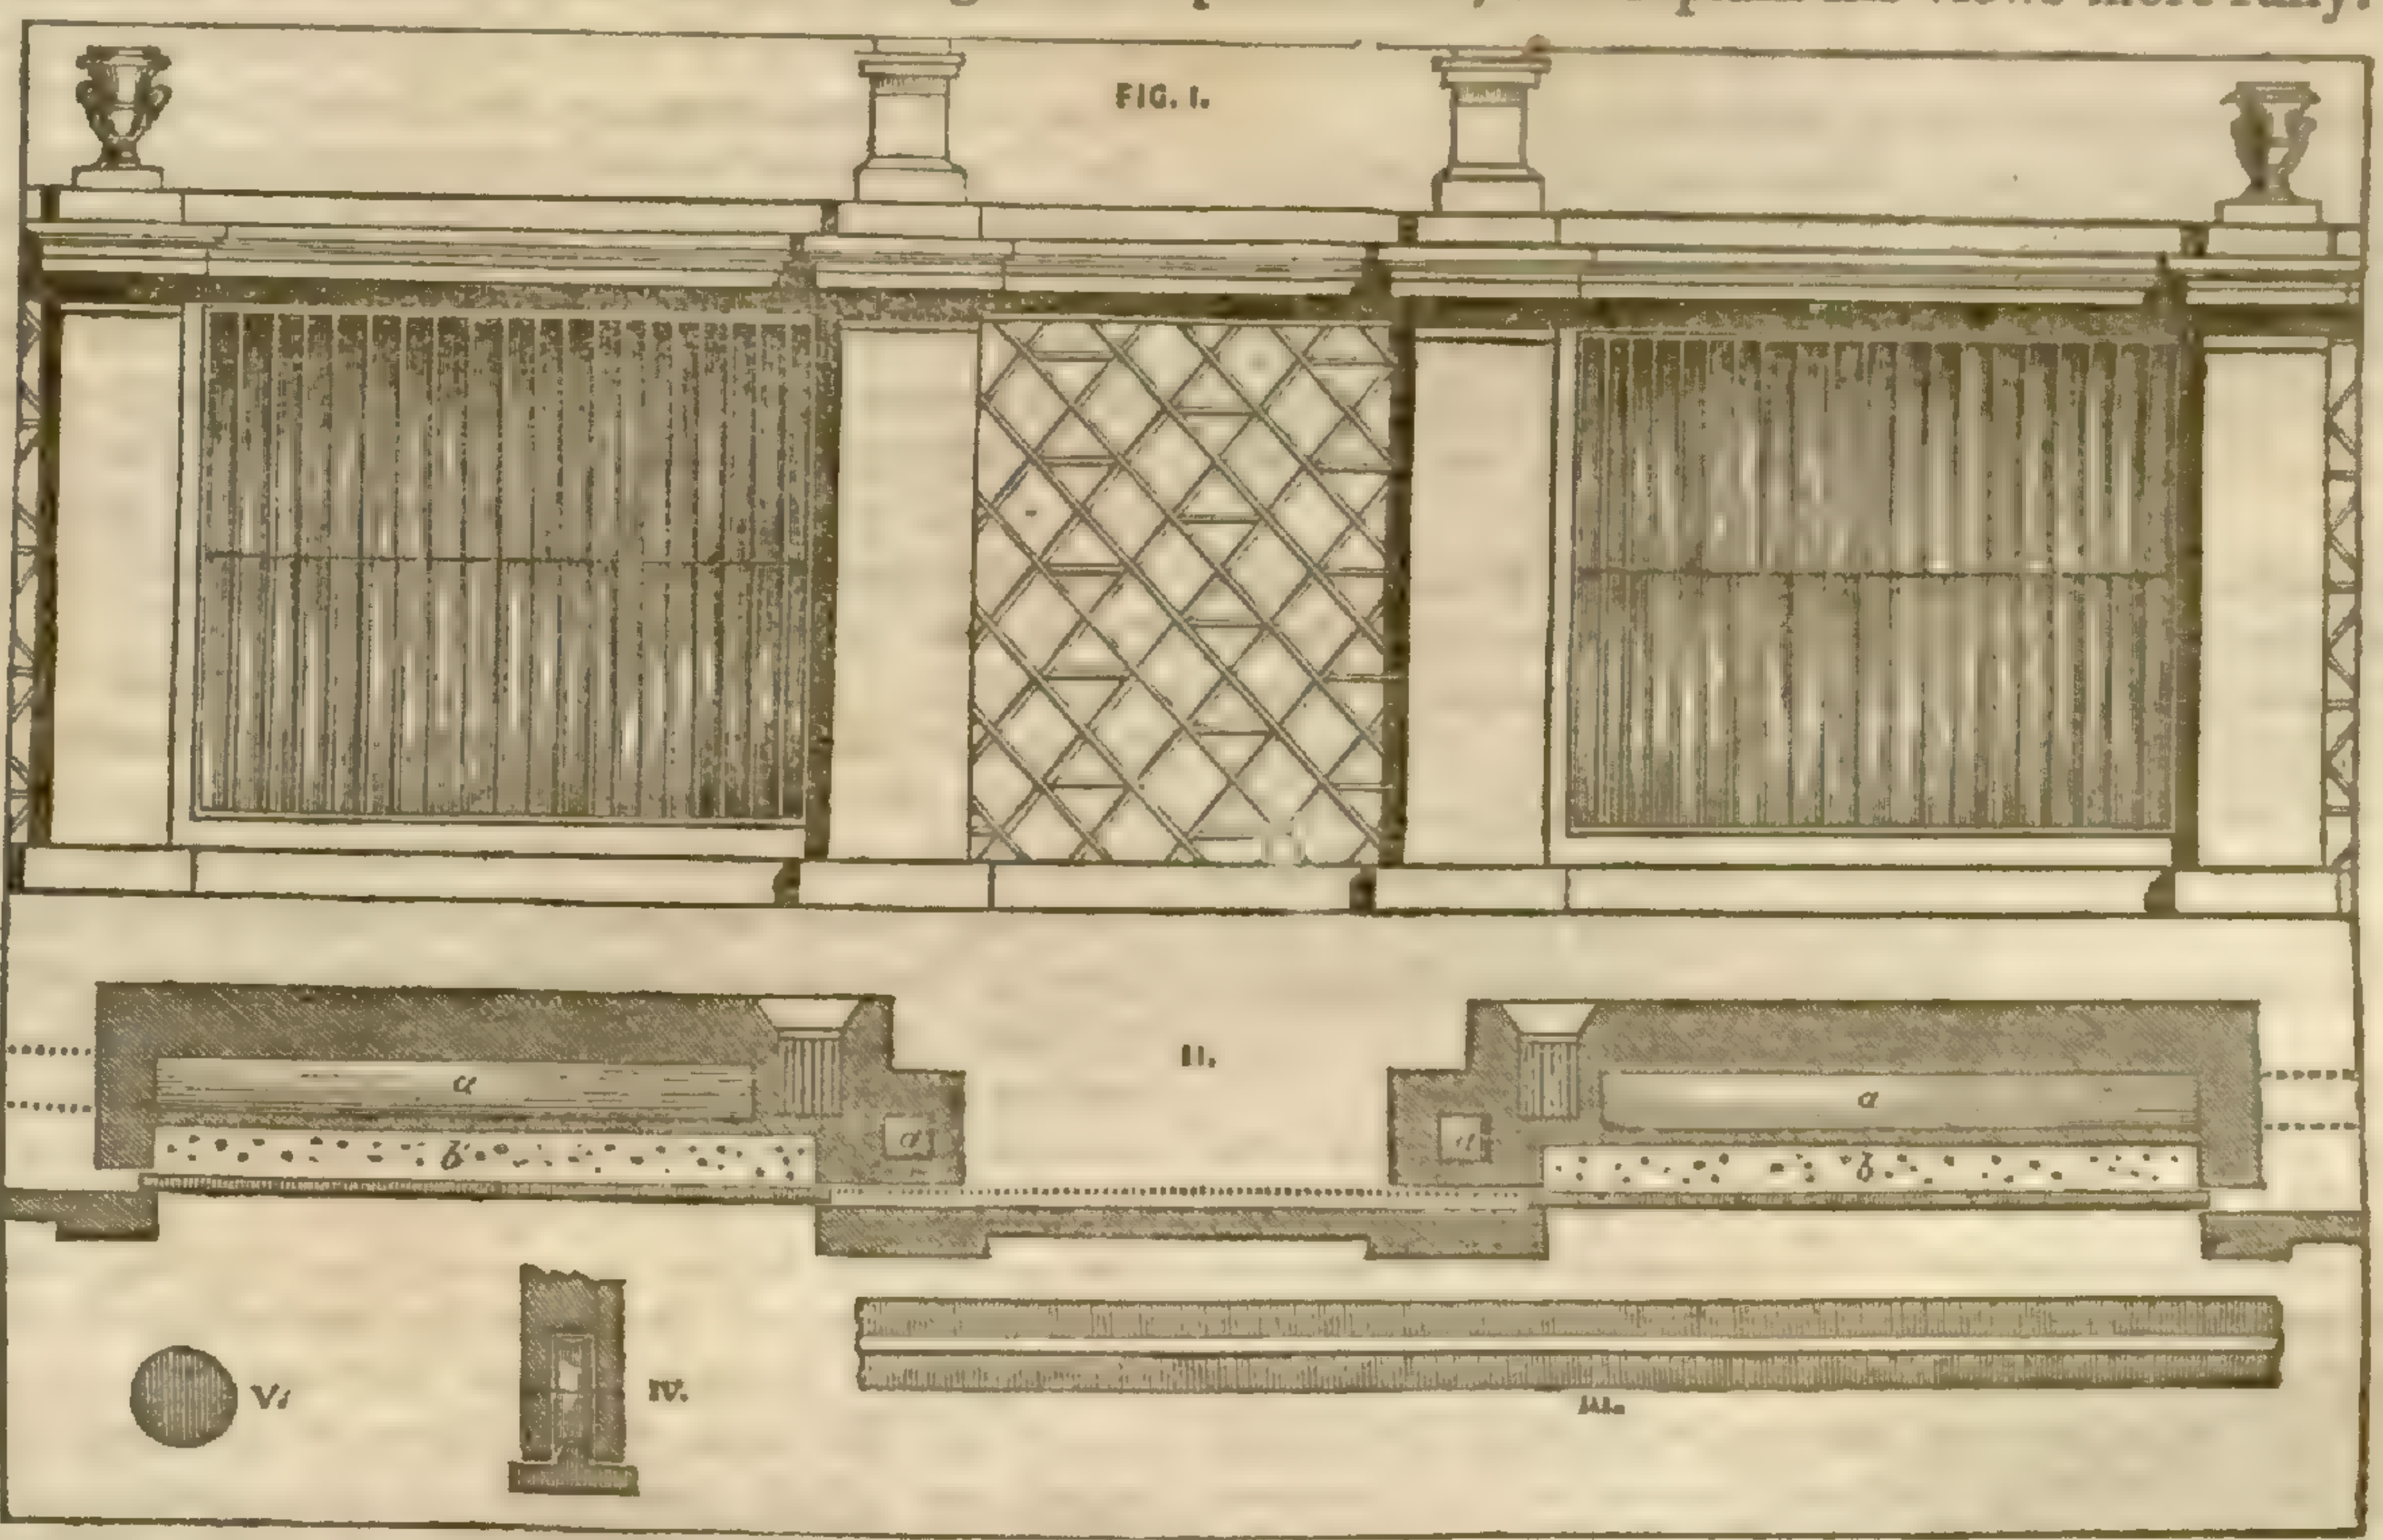
"In forming a conservative wall, it is necessary that it should have a south or south-western aspect. It is also desirable, in order to give it an ornamental appearance, that there should be prominent parts at certain intervals, or that the whole should be divided into recesses and projections. The latter, by being of limited dimensions, would serve for the display of the more hardy plants, and also afford additional shelter to the remaining portions. If, moreover, the whole be surmounted by an appropriate coping, its beauty will be greatly enhanced.

"Much has been said of the conservative wall at Chatsworth, the leading characteristics of which are a practical illustration of the opinions now advanced,—large retiring compartments, covered with a neat trellis, and relieved by occasional small stone projections or piers; and as the wall stands on a steep slope, each of the piers is raised considerably higher than the one below it, thus constituting, as it were, a series of very broad ascending steps on the top.

"The advantage of having a slight wooden trellis against the wall, instead of fastening the plants to it in the usual way, need scarcely be pointed out. Independently of its superior appearance, which is a point too frequently neglected in such matters, the greater ease with which the branches can be attached to it, and removed or altered at any time, is quite sufficient to give it the preference; while the destruction and defacement of the wall consequent on the use of nails, and the injury they often occasion to the shoots of the plants, give a value to any system by which they can be discarded. The extra expense of the trellis is too trifling to be regarded."

It has been found, in attempting to grow exotics against open walls, that whatever tends to preserve the border in which they are planted comparatively dry, during the winter, does more towards sheltering them from the frost than extensive protection of any other kind. As the fluids of plants are for the most part imbibed through the roots, and as the heat of vegetable bodies escapes mainly in proportion to the fluids they contain, protection to the medium in which they grow is, perhaps, even more necessary than to the stems and branches. It will therefore be seen that the portion of the border where the roots lie must be covered, and that if the canvas or other protection actually given to the wall does not extend over the border, a coating of dry litter should be spread over it as soon as severe weather cemmences, and be retained on it until the spring.

The following wood-cut, which we have borrowed from the "Magazine of Botany," with Mr. Paxton's permission, will explain his views more fully.



"Fig. 1 is an elevation of a highly ornamental conservative wall, which may be extended either way to any required length. The scale is one-twelfth of an inch to a foot. By referring to fig. 2, the ground plan of the same part will be seen, on a parallel scale. This shows the furnaces at the back, in the form of gratings; the flues, *a a*, which are carried under ground, from one division to another; and the space for plants, *b b*. The elevation in fig. 1 will be perceived to consist of plain pillars, crowned by the chimneys connected with the flue, and by simple vases. The space between the pillars supporting the chimneys stands much forwarder than the rest, and is faced by a trellis. The receding parts can be covered at pleasure, with a glazed light or lights, which, when not wanted, can be made to slide on rails behind the projecting portions. The rail at the back of the screen wall is shown on a larger scale, in fig. 3; and the bottom of the sliding light, with its revolving roller, is exhibited at fig. 4. A side view of the roller inserted at the base of the sash frame is given in fig. 5.

"A review of the chief features of the plan will leave the following general ideas. The wall is composed of alternate prominent and retiring compartments. Each of the former includes two stone pillars, which stand out a little beyond all the remainder, and are to be left uncovered; while between these is a division, over which is extended a trellis for supporting the hardiest sorts of climbers, and those that demand no protection. The recesses are capable of being covered in cold weather with glazed sashes, which can be placed out of sight in a moment, whenever it is safe to remove them, by sliding them behind the other divisions. In these recesses the tenderest greenhouse plants may be cultivated, and trained against a trellis, which could not be shown in the engraving. Thus are combined a handsome architectural elevation, and the means of having some of the finest exotic plants exposed in summer, without danger, and in a condition incomparably more healthy and attractive than they ever attain in the greenhouse."

If glazed sashes are too expensive, canvas or other screens can be readily substituted; but in that case the plants will suffer from being kept in darkness during the winter.

Where it is thought preferable, another set of rails, on the outside of those for the sashes, can be prepared to carry some kind of covering in rigorous weather. Where this is done, the necessity for fire-heat will be trifling; in fact, it might be entirely dispensed with. In covering such a wall, Mr. Paxton recommends that young plants should be always chosen—

"Because, however desirable immediate effect may be, it must never be obtained at the cost of subsequent and permanent beauty; and unless the specimens are young and small, they can rarely be trained in the required position, and will still less frequently produce branches from the base, so as to cover the lower part of the wall. To relieve the bareness which this system will occasion, a few fast-growing species may be inserted temporarily, taking care that they do not interfere with the others, and removing them when they are no longer needed."

In conclusion, Mr. Paxton recommends that

"The plants be pruned and trained into the form they are wished to assume, from the time of their transplantation; and after they have filled the space assigned them, they may be permitted to grow more wildly. For the first two or three years, likewise, healthy and vigorous growth should be more sought after than flowers, since these last can be supplied from the sources before alluded to. As soon as the more shrubby kinds, such as Mahonias, Camellias, Fuchsias, &c., have covered a moderate amount of surface, their lateral branches may be allowed to stand out from the wall, that they may make some approximation to their true character of shrubs, while they perform their original purpose of covering the wall. They will thus bloom more abundantly, and have a more natural appearance; the space above them being occupied by the more rambling and purely climbing species. Close training, indeed, ought to be abandoned with all the sorts after they have reached their prescribed limits, and they should be pruned on the spur-system, or so as to induce them to protrude from the general surface a great quantity of short blooming branches."

These observations will, we trust, convince our readers that a *conservative* wall, constructed on *liberal* principles, would introduce a great *reform*, not to say a *radical* improvement into the appearance of a flower-garden.

FLORAL ANALOGIES.

(Continued from p. 268.)

21. Mimetes hirta. Hairy Mimetes.—A plant named from μιμητης, a mime or mimic, because it resembles various other genera. It analogises with the mocking-

bird, and corresponds with pantomime in theatrical exhibitions.

22. Galium Aparine. Catch-weed.—A plant termed by the Greeks φιλανθροπον (Man-lover); its fruit are set with a species of hirsute bristles, which adhere to everything they come in contact with. It analogises negatively to a troublesome fellow; but affirmatively, to an officious but true friend. It corresponds also with the phrenological organ, philo-progenitiveness, in an affirmative sphere.

23. Mitchella repens. Creeping Mitchella.—A plant which may be termed social, from its growing together in large quantities. It analogises with a lover of society, and with that instinct which has led man to congregation, joint-stock companies, and associative and communicative ideas.

24. Heliotropium europæum. European Heliotrope.—The name of this genus has its derivation from ἥλιος, the sun, and τρεπω, I turn. It represents the faithful lover, as its flowers are always turned to the sun, and droop as if with sorrow at his departure. Among religionists it analogises with the Magian, or sun-worshipper.

25.—Campanula Speculum. Venus's Looking-glass.—The blooms of this flower are like an old-fashioned looking-glass, and analogise in form with ♀ the astronomical sign of Venus. It also corresponds with the woman vain of her beauty, who may always be said to carry a looking-glass about with her.

26. Campanula liliifolia. Lily-leaved Bell-flower.—This plant analogises with the precocious child. Before the panicle is produced, its leaves expand in a species of cluster upon the top of its stem, but are afterwards through its prolongation dispersed, as the precocious child after a few years generally loses its anomalous abilities, and becomes a being of a usual enough kind.

27. Scævola suaveolens. Sweet-scented Scævola.—A plant named in honour of Mutius Scævola, a hero of ancient Roman romance, who burnt off his right hand in the fire to attest his power of endurance. It analogises with left-handed people, as its flower seems to be defective of one side of its corolla. The Latin Scæva is the word for the left hand.

28.—Elæodendrum Argan. Spiny Olive Wood.—This tree resembles the Olive, the emblem of peace, and therefore analogises with a truce of war or comparative peace.

29. Itea virginica. Virginian Itea.—This plant in its leaves and place of growth resembles the Willow-tree, the emblem of sorrow, and therefore analogises with false or affected grief. Among the Amphibia, the crocodile, with its deceitful tears, corresponds with it.—*Goodwyn Barmby.*

AMATEUR'S GARDEN.—No. XXI.

THE art of root pruning, about which so much was written during the past winter and spring, will very probably have been practised by a considerable number of those who have fruit trees to manage, and in some instances perhaps carried too far. It will therefore be proper for me to put the Amateur on his guard against the effects which will be produced in the earlier part of the summer by two or three weeks of very dry weather, and to point out the way in which he may get over a difficulty of this kind. To water such trees may seem a very simple operation; yet more harm than good is frequently done by the manner in which the operation is performed. Many persons in watering out-door plants give them little more than others in the Greenhouse or Conservatory. This might be very well, if they watered the former with the same regularity, that is, as often as the soil gets dry. But as this is not often done, the small quantity of water given only tends to excite the roots and leaves, which, as soon as the water has evaporated, suffer more from their being so excited, than if they had never been watered at all. The amateur, therefore, when he finds his trees or shrubs suffering from the continuance of dry weather, should soak the ground well all round the plant, as far as he thinks the roots extend; then make a bason, and pour into it as much water as it will receive. Ten or twelve large garden watering-pots will not be too much for an ordinary sized shrub; and for a large tree three or four times that quantity will be requisite. If the operation is done in the afternoon or evening, the bason may be levelled down next day; and unless the weather continues dry for a very long time, no more watering will be required for the season. It will be found an excellent plan to cover the ground over with some substance, such as rotten leaves or dung, to stop evaporation from going on so rapidly.

Finish the planting out of tender flowering plants, in the beds or borders, as there is not much danger of their being injured by frost now. The greenhouse may be thinned, and many of the plants set out of doors, in order to make room for Balsams, and other summer flowers; besides, where Vines are grown on the rafters, they will now shade the plants too much. The Neapolitan Violet may now be propagated for winter flowering; some very good directions upon this subject will be found in the back numbers of this and the former volume. Heartsease, Pelargoniums, and almost all kinds of plants which strike from cuttings, may now be propagated by every one.

Many strong-growing plants will be benefited by being frequently watered with dung water. This is very simply made, by putting a barrowful of cowdung into a cask, and then pouring water over it. Stir and mix it well, and allow it to stand a little time before being used. Or, if the weather is wet, a cart-load of dung may be laid in the compost-yard, and a hole dug by the side of it, into which the liquid manure will run, and can be taken out and used at pleasure.—[illegible] F.

HOME CORRESPONDENCE.

Preventive System of Pruning Forest Trees.—I thank "Quercus" for his continued doubts and misunderstanding of my system, hitherto termed, "pruning forest trees," and which term I shall now alter. I still maintain this to be "the true system," and it will at no distant day be found so, when the present mania for agricultural pursuits is a little abated; and I certainly think that this country will, ere long, have to deplore the neglect of not attending to the means of making every timber tree, even in hedge-rows, available for some useful purpose. There is a very homely proverb, "always taking out of the meal-tub and putting none in, will soon come to the bottom." So a constant draining of timber from Canada, without raising any fresh, will, perhaps, in a shorter period than is anticipated, make it scarce and dear even there. Whether the supply from the Baltic is inexhaustible and sure, from fresh plantations springing up or made, I cannot ascertain; but it behoves the legislature of this country, or rather all landed proprietors, to consider it well before the evil day arrives, when gentlemen will have to regret what a serious loss they have sustained by not having adopted this method earlier. They will then say, "how valuable the timber on my estate would be, if this system had been adopted when first pointed out! whereas, it is now worth little in comparison." To be convinced, only let him look at the present state of the plantations, woods, and hedge-row timber in general; but particularly the latter, which is in a great measure useless for any valuable purpose. I am, however, obliged to "Quercus" for his further confirmation of what I have previously stated, about the misconception of my system by most people who have heard of it, as it gives me an opportunity of altering the term "pruning forest trees;" having been long convinced it leads many persons wrong, from their confused notions about it. But as it is to supersede the necessity of mutilating, lopping, snagging, &c., I shall term it for the future the "preventive system of pruning forest trees." I wish I could think of a better term; perhaps some friend will suggest one. It seems strange that "Quercus" should condemn a system he has not seen, nor the proofs I have given of it; but it is the case with him, as with many others, which more fully confirms me in the opinion that it will make but little progress until experimental plantations are formed as schools for practice to point out its utility, as hinted at in page 205, Number 13 of the *Gardeners' Chronicle*. To be brief with "Quercus." I entirely agree with him, that the increase of timber is from the quantity of branches and leaves of a tree, and that this system (he may call it foreshortening if he pleases) is to increase, when necessary, the number of branches and leaves, instead of reducing them, as he supposes, and to take none off until they have fulfilled the office nature has assigned them, and until others are produced to replace them in those important functions; so that he will see that we agree in principle, if he but understood the practice, which is simply to regulate the number, size, and form of the branches, according to their health and vigour. In fact, by this method, I can cause the increase of the stem to be greater or less, either as to height or girth, according to the quantity of branches left or taken off. Still I cannot help feeling a regret, that there is not more attention paid to the tables of experiments and proofs I have given in my book by those who have read it, and of the good effect of numerous healthy branches and leaves on a tree in accelerating the increase of the stems of timber trees, also of the contrary effects produced by the paucity or unhealthiness of the branches and leaves. I have only to observe, that to accomplish this desirable end, it must be commenced at an early period of their growth and followed up for a number of years. Therefore I repeat, without presumption, that it is the true system, and will eventually come into general practice, although, from the seeming indifference shown to the subject by those most interested in it, viz., the lords of the soil and woods, it may not be for some time to come; which brings to my mind the motto prefixed to a pamphlet I published some time ago relating to the above subject—"Truth is great, and will prevail."—*Wm. Billington.*

Disease in Ash Trees.—In the third column, p. 269, of the *Gardeners' Chronicle*, is a paragraph on "Disease in Ash Trees." I am encouraged by your notice of the subject to apply to you for satisfaction upon the nature of a complaint, I should suppose somewhat similar to that which you allude to, prevailing amongst the Ash-trees in my plantation, except that the decayed portion appears like an excrescence or warty protuberance. Ash-trees having this defect are said by the common people in this neighbourhood to be "pie-pecked." I observe the disease to prevail most strikingly in young trees of thirty years and upwards, say to fifty; occasionally under that age; it does not seem to be confined to such as are planted in any particular soil. Old trees (and I have some very fine ones) of 130 years' growth are free from it. It attacks those which have been apparently growing vigorously; shows itself upon the stem of the tree, but by far most extensively upon the branches, and invariably causes them to send out long unhealthy side shoots in all directions, which do not survive more than a season or two. As both pruned and unpruned trees show the same complaint, I cannot attribute it to such treatment. Those which grow forked in their main branches seem to be principally, but not exclusively, the subjects of this disorder. Any information that can be obtained regarding the treatment which may preserve young trees thus suffering will be very acceptable to—*Lancastriensis.* [We trust this will engage the attention of some of our foresting friends.]

Beech Trees.—It is, I think, probable that the soil in the neighbourhood of your correspondent "T. T." disagrees with his shrubs, more than their growing under Beech-trees. In our part of the country, we have enormous and luxuriant bushes (some almost trees) of Box, and Laurel, and Holly, flourishing under a Beech-grove, where there are no others. This is on a limestone soil, where we have not succeeded in growing Rhododendrons at all.—*Potentilla.*

Action of Wasps on Ash Trees.—May not the disease of the Ash, mentioned by a correspondent in your Paper of the 16th April, arise from the attacks of wasps or hornets? Some fifteen or sixteen years ago, in Somersetshire, I detected hornets barking an Ash, with as much assiduity and as great an effect as any two-legged urchin, armed with a knife, could have evinced. They had completely stripped branches as thick as my arm for the space of a foot or eighteen inches in length, working nearly in rows like mowers, and carrying off pieces of bark half as big as themselves, besides inflicting many injuries in other parts of the tree. Since that time I have never witnessed such an operation, but have often seen wasps upon the bark of the Ash and Elm, apparently engaged in the like work, on a smaller scale. About four or five years ago, some Elms in my own neighbourhood were much infested by wasps, and have ever since presented the appearance described by your correspondent in his Ash; but whether the wasps were the original aggressors, or only came to avail themselves of the labours of some other insect, either by feeding on extravasated sap or on the eggs or larvæ of that insect, I could not ascertain. As the trees affected were all contiguous, I was inclined to suspect some of the coleopterous tribe to be the real enemy, but failed to detect any extended injury below the damaged bark. Having observed the dead blotches in the bark of young Ash which had never felt the knife, I cannot ascribe it to bad pruning.—*J. R.*

Insects Injurious to Apples and Roses.—There is another insect peculiar to such districts, a species of locust commonly called Chovies; they rise out of the ground about this time, or a little later, in such numbers, that in two or three days every Apple-tree in fruit or Rose-bush in flower is covered with them, and do not cease their havoc until they have nearly consumed everything they alight on; but fortunately they do not exist long in that state. I should like to know if there is any way to stop their ravages, as I have sometimes tried of an evening to squirt them to the ground, where they will lie powerless until the sun shines next day, when they rise up and resume their destruction. Would lime-water drive them away in the same manner as it does ants? I had a colony of ants which regularly used to visit a pinery (it was a vinery till lately, so that scale was no inducement); they perambulated the whole house, but luckily before I had any Strawberries ripe they took themselves off another route. I had caught a good many in a jar with a little honey in the bottom, and I suppose they thought I had a design upon them, and that it was better to escape. A plum tree which was covered with scale near the said pinery used to divert them a little, but I washed it with hot soap-suds, and they have relinquished it also; so that I hope they will give me no further annoyance.—*J. M.* [It is very probable that lime-water would drive them away.]

Cockroaches.—I fear that your valued correspondent "P. P." has not quite forgiven my story of the "Lord Mayor's Cat." Nevertheless I will not dispute the superiority of his mode of catching cockroaches, but state merely that it did not succeed with me. For years we had been used to employ basins of sugared beer, sometimes embanked in sand, sometimes surrounded with ladders of lath most invitingly placed to induce the creatures to walk up, but they came in such small numbers as to leave the nuisance practically unabated. No sooner, however, was the basin sunk level with the hearth, than the clearance took place as if by magic; and the only reason for not applying a bait was that none seemed necessary. We saved, therefore, the expense of providing the "butt of malmsey," and the trouble of straining it for re-use. Water was added simply to detain the captives more securely, as otherwise a very vigorous specimen would manage occasionally to scale the dry walls. I believe that the action was not that of a trap, but simply that of a pitfall, into which the victims ran heedlessly as it lay in their path.

Nets as a Protection for Fruit.—I have frequently read of nets being a protection against gnats and mosquitoes, under the supposition that they take them for spider's webs. It is very probable, as they are long legged insects, that the least obstruction stops them; but I can assure "Ruricola" that nets are no impediment to wasps or flies, either on walls or bushes. They will either fly directly through them, or alight on them, and creep through the meshes if there is anything enticing under them. They generally reduce all my White Currants (Red they do not care much about) and Morello Cherries to mere husks by the beginning of September; although I sometimes cover them with a triple case of nets pegged out a foot from the wall. I do not know whether there is any peculiarity in the nature of soils to encourage the production of wasps, but on stiff wet soils in seasons such as last, there were none to be seen; whereas on light sandy ones like this they were as numerous as ever.—*J. M.*——I was surprised at reading, in No. 19 of the *Chronicle*, an assertion by "Ruricola," that a net spread over a wall will preserve the fruit from the attacks of insects. I have seen many trees on walls, especially Cherries, covered with nets, but never witnessed that either flies or wasps were deterred from passing through the meshes and devouring the fruit. The destructive powers of those pests are too often felt, and any method by which they may be prevented from preying upon his fruit would be of very great service to the gardener. Should any of your correspondents have experienced the truth of "Ruricola's" assertion, I shall be very glad to hear of it, and to learn the particulars as to the sort of net used, &c.—*W. E.* .

Curling of the leaves of Peach-trees.—Mr. Hayward having, in his book, stated his belief that the exposure of a tree to the weather is not the cause of the curling or blistering of the leaves of Peach-trees, begs to explain on what he grounds it. First, he has frequently observed that of two trees growing alongside, one was curled and blighted, and the other not. He therefore concluded, that, as the weather would affect the one as well as the other, this could not be the cause; and Secondly, he not only has often observed that whenever trees have appeared with blistered and curled leaves, the soil has been recently over-saturated with putrescent manure; but he has repeatedly proved by experiment, that whenever the soil in which the roots of the Peach-tree are embedded, is overcharged with manure, particularly during the months of November, December, and January, the trees are uniformly infected with curled or blistered leaves. The cause, therefore, he considers, is rank and unwholesome food.—*Lyme.*

Cause of Mildew in Peas.—It is no uncommon thing to observe the leaves of Garden Peas covered with mildew in autumn; various reasons are given for its appearance, some persons being of opinion that it proceeds from want of moisture, others saying that too much wet is the cause of it. In a garden, considered well drained when it was made, the mildew was very common on the stem and leaves, and sometimes attacked the pods. The ground received another extra draining about three years ago, since which time the fungus has not troubled the crops of Peas; from which circumstance one would be ready to infer that an over-supply of moisture was the true cause of the mildew. Your well-timed remarks about draining, in a leading article lately (p. 267), ought not to stop with Vine borders, but should be practised in every department of gardening.—*Peter Mackenzie.*

Œnothera serótina.—I know not of any flower that makes a better autumnal show than this when planted out in a bed by itself, which it will literally cover with flowers every evening and sunless day, until quite late in the season. If the flower-garden where it is grown is under high keeping, the bed should be looked over every morning, and the flowers of the previous day carried off; this will very considerably add to its beauty. Where a quantity of it is wanted for bedding, this is the fit time to attend to its propagation by preparing cuttings (as soon as the young wood has advanced to the length of one and a half or two inches), pricking them out in sand in the open ground and covering them with a hand-glass. If treated in this manner, the whole of the cuttings now put in may be expected to root, and be ready for planting out in a month; whereas, if deferred until the autumn, when the increase of flower-garden stock is considered *en masse*, the probability is that not one will succeed. This I have found to be the case with me, although others may know of many exceptions to it.—*J. H., Elmham Hall.*

Oxalis acetosella.—Some time ago I recommended the Oxalis acetosella as an edging for shady walks; the plant was objected to by your correspondent "J. D.," who says, "It is pretty well known to gardeners that the leaves of the Oxalis acetosella disappear about the end of November, and are not seen again till the month of April." I have no desire to contradict the statement of any man rashly, but justice ought to be done to the character of a plant, however lowly its situation may be. I have often observed the Woodsorrel in shady places from November until the present time, and its leaves are still fresh and unchanged, apparently giving the young ones in their light green livery a hearty welcome; and instead of remaining eight months, as stated by "J. D.," I find that the leaves continue green at least thirteen months; so that I think the Woodsorrel may be looked upon as an herbaceous evergreen, as well as the evergreen Alkanet, Anchusa sempervirens, and the intermediate winter-green Pyrola média.—*Peter Mackenzie.*

Indigenous Plants.—Is there any rule or law whereby collectors of plants may know when a plant may be called indigenous, and be added to the flora of the country? I find the red Valerian (Valeriana rubra), Barren Wort (Epimédium alpinum), yellow Balsam (Impátiens noli-metángere), and many others, placed among the native plants of this country. The common Parsley (Apium Petroselinum) is also ranked among the indigenous plants of England and Scotland; I have found it growing among the rocks of Stirling Castle, but it probably found its way there among the rubbish from the garden; this is said to be a native of Sardinia. I have read in old histories that the Furze or Whin (Ulex europæus) was introduced into Scotland, as a plant for fodder, by one of the kings, and it is now set down as indigenous. If such plants as these are to be admitted as natives, then there are many others that have as good a claim. The Rumex alpinus, or Monk's Rhubarb, is found growing in waste places far removed from gardens, and is said to grow naturally upon the Alps. The yellow Monkey-flower (Mímulus luteus) is also found on the banks of rivers, apparently in a wild state; yet I am not aware if any of these plants are admitted into the British flora, although they have as good a right to be as many others.—*Peter Mackenzie.*—[It would be easy to give what are called rules in judging upon such subjects; but they are of little value. The best rule is to investigate carefully, and to help out the investigation with a *modicum* of common sense.]

Imposition Practised upon Gardeners.—We understand that a great deal of imposition has been lately practised by women representing themselves to be the widows of gardeners, in various parts, and particularly in the West of England; we therefore take the opportunity of exposing them, and putting our readers upon their guard. One of these, a tall, stout, red-faced Scotchwoman, a good deal pitted with the small-pox, represents herself as the widow of a gardener who is lately dead, having left her with five children, one of which had also recently died; that her husband had worked for the two years previous to his death at Mr. Pontey's Nursery, Plymouth, and also at Messrs. Veitch's of Exeter, and that she is travelling to her husband's parish at Dorchester. She is remarkable for a great flow of water trickling down her cheeks, apparently produced from a phial which she has artfully concealed in a handkerchief, and which she is constantly applying to her eyes, as if to wipe away her tears. Another is said to be a short, thin, pale-faced woman, who pretends to have been left a widow with four children, and to be travelling to her husband's parish in Cornwall. There is also a short, sturdy fellow, dressed in a fustian jacket and trousers, swansdown waistcoat, and half-boots, who represents himself to be a broken-down gardener, and to have been out of work five months. This man is well known to have been travelling through Essex and Kent five years ago, with the same story.

To stop Bleeding of Vines.—A correspondent informs us that he has found the following plan to answer perfectly in stopping the bleeding of Vines. It is simply to cut a hole in a Potato sufficiently large to receive the end of the bleeding shoot, upon which it is to be firmly pressed. This remedy, although it appeared ten or twelve years since in Loudon's Gard. Mag., may not be known by the generality of our readers.

Bleeding of the Vine.—Major Moor begs leave to inform the Editor of the *Gardeners' Chronicle* that the communication on the "bleeding of Vines," p. 317, on which so many as "six correspondents" have seen fit to "complain," was not sent to the learned Editor by him. There may, it is true, be more than one Simon Pure; but as no other is known to the writer of this note, he confesses the soft impeachment, but is compelled to reject all that is imputed to him upon the subject. Of the juice of the grape he may, peradventure, be able to say something practically; but beyond that, as concerning the Vine, he is altogether ignorant and innocent. [We have been unfortunate in mistaking one correspondent for another.]

Yellow Banksian Rose.—Your correspondent "F. X.," in No. 19, may now see a Yellow Banksian Rose in full bloom, covering the front of a small house in the village of Datchet, near Windsor, which does not appear to have been treated in any particular manner. The aspect is a little to the south of west.—*M. D. P.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Exhibition at the Gardens, May 14th.—Neither the most zealous devotee of horticulture, nor the most ardent patriot could have desired a more striking proof that their pursuit or their country were not in an inactive or declining state than was furnished at the Exhibition of last Saturday. It is difficult to decide whether the natural beauty of the flowers, their tasteful arrangement, the tokens of skill in cultivation they afforded, or the interest which the company evinced in their inspection was the more gratifying or remarkable. The previous rains had brought everything in the gardens to the highest perfection. The day was fine, with a genial, but not oppressive warmth, the lawns and walks neither damp nor dusty; vegetation just clothed in that lovely green which is peculiar to the present season. The noble Wistária sinensis, that finest of hardy climbers, was completely laden with its newly-opened and delicately-perfumed blossoms: the plants in the great conservatory yet more luxuriant than those in the open air, and some of them splendidly in flower; the collection of exotics in the exhibition, varied and rich in the extreme; their disposition as to the diversity, contrast, and yet harmony of their colours, was the subject of admiration; and the visitors were numerous, but select, and by no means crowded. The three military bands performed in their usual style; and, as if to finish the whole, and give an additional zest to all the other attractions, a friendly nightingale

> "All day long her amorous descant sung"

within 50 yards of the principal tent.

Cultivators will be pleased to learn that their productions were gazed upon with approbation by her Majesty and Prince Albert, who, with the Duke of Devonshire, the Duchess of Sutherland, Lady Carlisle, Lady Newburgh and suite, honoured the exhibition with their attendance. The other visitors, including many illustrious names, amounted to 5,500. The subjects of exhibition were so abundant, and generally so fine, that nothing but a mere outline can be attempted. The tribe which of all others attracted and deserved most notice was the Azáleas; the specimens sent far surpassed those brought in former years. They were treated in four different ways: First and rarest, there were plants exceedingly dwarf and bushy, with the branches actually depending over the edges of the pots. These were peculiarly interesting, and confined mostly to A. laterítia and variegata. Next, there were some almost equally low, but very spreading, and with their branches also inclining downwards. While the former were not more than a foot or 18 inches in diameter, these were from three to five feet across, and included the White Indian and a few of the crimson-flowered kinds. Again, there was a group which had been left to grow naturally, with perhaps the principal stem fastened to a stake to keep it upright, and two or three of the branches tied in a little to draw the flowers more into a mass. Lastly, there were many, both with and without a bare stem, of 1 or 2 ft. in height, that had the points of their branches brought into a flat, or nearly flat, surface—thus throwing all the flowers to the front, and, of course, rendering that front far more thickly studded with them than an ordinary bush could be. The specimens of the first class had been procured from cuttings, or by grafting very low on the stocks, and pruned freely, as well while growing as during winter. The branches had also most likely been tied down at the points. Those of the second tribe had been raised similarly, and perhaps treated in the same manner, but were commoner and stronger-growing sorts, and had been kept in a very light house, near the glass. The third group, which was the least ornamental, exhibited a want of culture, or, at least, showed by their defects what the aid of art had accomplished in other instances. Their shoots, having been tied up for the occasion, evinced, too, the injudiciousness of attempting to train a plant after it has perfected its growth. Several of the flowers were unavoidably turned inwards, or on one side, instead of towards the spectator. In the fourth class, however, a good effect was produced by training all the shoots so as to present only one front. A specimen of A. laterítia so arranged was brought by Mr. Green, gr. to Sir E. Antrobus, Bart., and was certainly an admirable specimen of culture. The blossoms were so close that it seemed almost impossible for them to exist in such a crowded state. It was 4 ft. high, on a stem about a foot long. The same variety was exhibited from the same collection only 1 ft. in height, extremely dense and beautiful. Mr. Green also had A. indica variegata as large as the first-mentioned A. laterítia, and scarcely less prolific of flowers. To those desirous of improving the race of greenhouse Azáleas, these two kinds may be pointed out as models in respect of the form of their flowers. From Mr. Green there were, further, an A. splendens, seven feet high, with immense deep crimson flowers, and in a magnificent condition; phenicia and Smíthii, equally good; two very remarkable plants of the splendid double red variety, one being quite 6 ft. high, and full of blossoms; and a gorgeous specimen of a new kind called A. Gréenii, which has rich and well-formed crimson flowers. All Mr. Green's Azáleas appeared to be trained with the view of bringing their flowers to the front; and hence their peculiar splendour. The dwarf specimen we have spoken of is obviously excepted from this remark. Mr. Croucher, gr. to J. Allcard, Esq., of Stratford, exhibited a very beautiful dwarf plant of A. indica variegata, and a superior specimen of the same variety, together with a splendid plant of a deep crimson sert. A very pretty white kind, fully 6 ft. high, and profusely covered with bloom, came from Mr. Falconer, gr. to — Palmer, Esq., of Cheam. From Mr. Barnes, gr. to G. W. Norman, Esq., there were a double red Azálea in a nice dwarf state; A. laterítia, also dwarf, but with small flowers; the variegated variety, exceedingly good, 2 ft. high; and a crimson Azálea, with semi-double flowers, 4 ft. in height, and particularly fine. An extremely handsome specimen of the white Indian Azálea was sent by Mr. Flogan, gr. to H. Pownall, Esq. Spring Grove. It was 3 ft. high, and at least 4 ft. broad. In another collection by Mr. Barnes there was a plant of A. Smíthii, 3 ft. in height, which presented a superb mass of blossom; a bright red-flowered variety, 1 ft. high, very full of bloom; one called Semidouble Scarlet, with particularly large and brilliant flowers, which have a slight tendency to become double; A. sinensis, finely-grown, and with its rich yellow inflorescence creating a delightful variety among the rest; a double crimson-flowered variety, beautifully in flower; and A. Gledstanésii, 18 in. in height, and well covered with blossom. The last kind was exhibited, too, by Mr. Green as a detached specimen, and drooped over the sides of the pot in an elegant manner. Its flowers are formed like those of A. indica variegata, and are mostly white, with here and there a stripe, more or less distinct and broad, of deep pink. Mr. Hunt, gr. to Miss Traill, besides good specimens of A. phœnícea, and a very luxuriant one of the white sort, had an admirable plant of A. Danielsiana, 4 ft. in height, and blooming mest abundantly. The flowers were rather pale red, from having been forced, and the plant is easily known by its small, neat, and compact foliage. Mr. Goode, gr. to Mrs. Lawrence, Ealing Park, contributed several specimens, which were conspicuous for their health, as well as for the numbers and size of their blossoms; of A. splendens phœnícea, one much resembling the first-named; a particularly good white variety, which was like a hillock of snow, and the double pink sort, dwarf, but more than 4 ft. in breadth, and extremely delicate. A quantity of new varieties were furnished by Mr. Smith, nurseryman, of Norbiton, Surrey, and amongst them were several with striking flowers. One, which had very pale and transparent red or salmon-coloured blossoms of a large size, and tolerably good form, appeared to divide its claims to superiority with another of a most intense crimson hue, having numerous dark spots. A semi-double crimson one was also good; and there was a fine white kind, named A. phœnícea alba. A selection of hardy Azáleas, in baskets, from Mr. Donald, of the Woking Nursery, had an interesting appearance. After the Azáleas, Cacti and Heaths commonly occupy the foremost rank. On this occasion, however, we think precedence is due to the climbing plants. It is with delight that we note, having called attention to the subject in our report of last year, that there were a great many species of these charming objects present, aud that many of them were superlatively fine. The possibility of growing even rambling and luxuriant climbers in pots to trellises not more than 4 or 5 ft. high has now been fully demonstrated; and it is alike palpable that plants so managed constitute some of the most beautiful objects which can engage the cultivator's notice. The trellises most common were those with flat surfaces, exhibiting an oval or irregular contour, some expanding at the bottom, so as to cover the pot, and such as resemble a barrel, or are simply cylindrical in figure. Two or three were completely globular, except on the lower side, and some were of a common cylindrical form, but low, and covered at the top, with the plants trained over them so closely, and branching out from their surface so naturally, as to give them the aspect rather of dwarf bushes than of trellis-supported climbers. The most noticeable feature in their culture was the training of the shoots so closely together as almost to hide the trellis, and to display as continuous a sheet as possible of foliage and flowers on the exterior. It was observable that where this had been most carefully effected, by far the most splendid results were realised, and certainly nothing could be more demonstrative of the good effects of any treatment than were some of the climbers of that we have just referred to. Probably the best plan, where immediate display is not wished for, is to train the plants thinly to the top of a suitable trellis, take the principal shoots again to the bottom, and re-direct them upwards, between the older portions. The first wood is thus better matured, and though two or three years will elapse without any striking result being obtained, the ultimate effect will be all that could be desired. In all cases, however, a high trellis must be guarded against, as it is not a tall specimen, with the flowers principally at the top, that is most beautiful—but one over which the leaves and blossoms are pretty regularly and generally distributed. These hints were suggested, and will be borne out, by the climbers exhibited. The specimen which struck us as being most astenishing was one of Zichya glabrata, from Mr. Clarke, gr. to G. Smith, Esq., of Shirley Park. It was about 3 ft. high, the same breadth, on a flat trellis, and had a cluster of flowers to almost every square inch of surface. The bunches of blossom, from standing out on long flower-stalks, had their beauty greatly increased. A plant of Kennédya monophylla, 4 ft. in height, proportionately broad, on a similar trellis to the last, and so densely covering it that it could not be seen through, was sent by the same person, and by the profusion of its large deep green leaves and blue flowers, made a very admirable display. Mr. Clarke further exhibited Philibértia grandiflora, in a good flowering condition; Tweedia cœrúlea, affixed to the front of a flat trellis, and producing a lively effect; a species of Maurándya, probably pulchella, with light lilac flowers, and forming an interesting and close pyramid 4 ft. high; Kennédya nígricans, on a round trellis, with its noble foliage, and curious blackish and yellow flowers; Kennédya longiracemosa, 4 ft. high, on a circular flat trellis, remarkably good; and Sóllya heterophylla, with its pretty drooping blue blossoms. A Zíchya coccínea, 4 ft. high, from J. Allnut, Esq., of Clapham, was a magnificent specimen; and Mr. Wilson, gr. to J. Labouchere, of Bedford Hill, Streatham, produced the same species, 6 ft. high, with a prodigious quantity of flowers; it was supported on a fancy trellis, the figure being contracted towards the top. Mr. Redding, gr. fo Mrs. Marryatt, of Wimbledon, brought a plant of Clematis cœrúlea, which, though hardy, flowers most perfectly under protection; and Clematis Sieboldi came from Mr. Hogan, gr. to H. Pownall, Esq., Spring Grove: the latter being on too large a trellis, and its branches, leaves, and blossoms too much diffused, did not look so well as it does when these are more concentrated. Mr. Barnes, gr. to G. W. Norman, Esq., contributed a handsome Kennédya monophylla, and a superb plant of Zíchya coccínea, on a trellis 5 ft. in height. From Mr. Hunt, gr. to Miss Traill, of Hayes Common, there was an excellent Gompholóbium polymorphum, which had many blooms expanded, and a greater quantity in the bud state; it requires to be trained very closely, being of such a slender habitude. Tropæolum tricolorum, or a variety of it, was likewise in Mr. Hunt's large collection; it was fastened to a trellis 4 ft. high, which came down over the pot, and the plant was in more vigorous health, and the flowers larger and richer, than we have ever before seen them. Mr. Redding, gr. to Mrs Marryatt, and Mr. Davis, gr. to Lord Boston, had also plants of Tropæolum tricolorum, in both a healthy and a free-flowering state. A plant of Zíchya pannosa, from Mr. Green, gr. to Sir E. Antrobus, Bart., was 5 ft. high, and approached, in point of merit, the Z. glabrata before named: it was a brilliant object, and the species has more handsome leaves than many of its allies. Mr. Bruce, gr. to B. Miller, Esq., of Mitcham, showed an attractive specimen of Kennédya monophylla, not more than a foot high, completely hiding a trellis by which it was sustained, and throwing out its branches like a small shrub; although so dwarf, it had a singularly healthy look, and was blossoming most liberally. But the greatest variety of climbers was derived from the gardens of Mrs. Lawrence, Ealing Park; among these was a tall plant of Aristolóchia trilobata, trained on a funnel-shaped trellis, and bearing a prodigality of its grotesque-looking blossoms; Thunbérgia Hawtayneana, the flowers of which were not very perfect; Ipomœa Hardíngii, which is allied to I. scabra, but is much larger in all its parts—a good instance of how the strongest plants may be grown on a low trellis; a new species of Ipomœa, with attenuated fig-shaped leaves, and large deep purple flowers, which have a tube that contracts greatly towards the base; Manéttia cordifólia, on a spherical trellis, and in the finest health; Gompholóbium polymorphum, spread over a flat trellis, 3 ft. high, and beautifully in flower; Stephanotis floribundus, an immense plant, singularly robust, but only just beginning to flower; Zichya pannosa, or a species very near it, 5 ft. high, in capital condition; Zichya coccinea, trained to the height of 6 ft., peculiarly splendid; Kennédya monophylla and longiracemosa, each from 3 ft. to 4 ft. high, cultivated to an amazing degree of perfection; and Poírrea coccínea, twined round a barrel-shaped trellis, and flowering in the greatest freedom. Two novel species of Tropæ'olum were in the exhibition: one named T. polyphyllum, being sent by Mr. Green, gr. to Sir E. Antrobus, Bart., and having leaves with numerous narrow segments, and bright yellow flowers, the shape of those of T. tuberosum; the other, T. édule, with somewhat similar leaves, and dark orange blossoms, like the others in figure: the last was from F. Coventry, Esq. Of Cacti there was the usual assemblage of sorts. Few flowers, however, of Céreus speciosíssimus were expanded, though there was a very richly-grown specimen of it from Mr. Kyle, gr. to D. Barclay, Esq., of Leyton; and two equally well-cultivated plants of the same species, from Mr. Barnes, gr. to G. W. Norman, Esq.; C. speciosus, 5 ft. high, from Mr. Barnes, was very well-flowered; and a dwarfer specimen, 3 ft. in diameter, was still more finely in blossom. Two plants of Epiphyllum Ackermánni were produced by the same cultivator, and were really superb. Céreus Jenkinsónii was sent from Mr. Goode, in excellent order, and a singularly spreading plant of C. speciósus, astonishingly prolific of flowers. The most noticeable Cactaceous plant, however, was a Céreus flagelliformis, grown by Mr. Green, market gardener, of Turnham Green: its shoots hung down for a great length, around the pot or box in which it was planted, and bore several large tufts of lovely crimson flowers. The main groups of Heaths did not appear to us so fine as we have before seen them; nor were there such enormous specimens as we have previously witnessed. In the health and beauty, nevertheless, of some of the smaller plants, we discovered much to excite surprise and admiration. The Erica Hartnelli exhibited by Mr. Green, gr. to Sir E. Antrobus, Bart.; the E. aristata major of Mr. May, gr. to E. Goodhart, Esq., Langley Park; the E. élegans of Mr. Jackson, Kingston; E. sulphúrea, by W. H. Storey, Esq., Isleworth; E. linnæoides, by Mr. Barnes, gr. to G. W. Norman, Esq., were, respectively, worthy of the highest encomiums. They were all dwarf, bushy, and healthy, possessing the last qualities to an extent rarely paralleled. Larger yet scarcely less highly cultivated plants of E. Boweiana were shown by Mr. Goode, the spikes of flowers being unusually dense; with E. Willmoreana, or a species very much like it, 5 ft. in height, with between 30 and 40 spikes of flowers; E. Hartnelli and suaveolens, the former one of the richest of the tribe, and the latter a pretty lilac-flowered, sweet-scented species, by Mr. Hunt, gr. to Miss Traill; E. conspicua nana, 4 feet high, very closely branched, with delicate pink blossoms, and E. princeps, a large plant, having showy pale red flowers, by Mr. Jackson, of Kingston; E. echiiflora purpúrea, dwarf and covered with bloom, and E. persoluta alba, thickly clothed with small white blossoms, by Mr. Redding, gr. to Mrs. Marryatt; E. Barclayana, 5 ft. high, with neat pink pendulous flowers, by Mr. Kyle, gr. to R. Barclay, Esq.; E. odorata alba, a lovely variety, exceedingly well grown; E. campanulata, studded with elegant yellow blossoms, and E. hýbrida, 3 ft. high, growing finely in one of Mr. Beck's slate tubs, by W. H. Storey, Esq., of Isleworth. The show was somewhat deficient in Orchidáceæ; comprising, however, some rare species. Aérides odoratum, with 4 racemes of its fascinating blossoms, and Saccolábium guttatum, bearing 2 long racemes of charming pink, and white flowers, were from Mr. Goode, gr. to Miss Lawrence, Ealing Park; Mr. Hunt, gr. to Miss Traill, brought the white-lipped variety of Epidendrum macrochilum, cultivated in a very superior manner; a pretty little Oncídium, apparently sanguíneum, with cream-coloured flowers, mottled with a purplish hue, from Honduras; Dendróbium pulchellum, a small but pretty specimen; and Oncídium sphacelatum, which has very long and large flattish pseudo-bulbs, and fine yellow and brown blossoms, arranged on short alternate branches, issuing with great regularity from opposite sides of the flower-stem. From some person whose name we have unfortunately lost, there was the rarely-bloomed Epidendrum bicornutum, whose flowers are hardly less beautiful than those of the much-praised Phalænopsis; Oncídium ampliatum, very strong and well flowered; Acanthophíppium bicolor, with a profusion of its ornamental blossoms; a good specimen of Oncídium flexuosum, and one of the pretty varieties of O. lúridum. From Mr. Paxton, gr. to his Grace the Duke of Devonshire, there was a fine plant of Myanthus cérnuus, with its singular nodding racemes of extraordinary flowers; Oncídium sphacelatum, before mentioned; Brássia maculata, a large plant, with its roots enveloped in moss; Oncídium pulchellum, one of the most graceful of Orchidáceæ, supporting its transparent pinkish white blossoms on an airy, wire-like stalk; Maxillária tenuifólia, peculiar for its narrow leaves, and having flowers which are mottled, with unusual richness, with a reddish brown on a yellow ground; Cattleya Mossiæ, bearing two flower-scapes, with three blossoms on each, a noble plant, but the flowers injured by travelling; and the very scarce and exquisite Dendróbium Devonianum, which seems to be too fragile and beautiful for a flower of earth. Saccolabium guttatum, producing from 12 to 14 racemes of flowers, was from Mr. Jarratt. G. Barker, Esq., of Birmingham, sent a small plant, rather imperfectly flowered, of the Phalænopsis amábilis, the blossoms of which were borne on branches that had issued from the old flower-stems. It is a delightful plant, and seldom without bloom. Oncídium lúridum guttatum was supplied as a single specimen, by Mr. Barnes, gr. to S. W. Norman, Esq., and is a truly splendid variety. Finally, Mr. Brewster, gr. to Mrs. Wray, of Oakfield, near Cheltenham, produced Cattleya Skinneri, which eclipses nearly all the other species in the brilliant crimson tint of its sepals and petals. The lip is a little darker at the summit, but very light towards the base. The flowers are rather larger than those of C. Harrisóniæ, to which they approximate in colour; being, however, altogether superior. We pass now to the grand feature of the exhibition, which was the fineness of the plants grown for specimens, whether shown singly as such, or appearing in the larger groups. Of store species, not yet referred to, there were Pleroma heteromalla from Mr. Goode, 4 ft. high, and cultivated to the highest possible perfection; Clerodendron squamatum, 5 ft. high, very luxuriant, and heavily laden with its peculiar blossoms; Ixora Bandhúca, glowing in its ordinary richness, from two or three persons; and the new Colúmnea Schiediana, brought by Mr. Barnes, having an unusual number of its odd-looking, though prettily-painted flowers. The greenhouse species, not already spoken of, were far more abundant. The dwarf shrubs comprise the well-known Leschenáultia formosa, which was as fine as in former years, from several cultivators; Helichrysum púmilum, handsomely grown by Mr. Green, of Cheam, and Mr. Bruce, gr. to B. Miller, Esq., yet not sufficiently developed to show the golden tints in the centre of its flowers; Leschenáultia biloba, beautifully cultivated and flowered, by Mr. Green, and exhibiting its blue flowers to advantage near L. formosa; Eriostemon buxifólium, a most symmetrical and elegant specimen, from Mr. Mountjoy, of Ealing: Corræa speciosa, not more than 2 ft. high, and so thick as to be impenetrable to the gaze, from Mr. Barnes; Chorozema Henchmánii, 3 ft. high, of equal breadth, copiously bedecked with flowers, and what is an uncommon circumstance—really healthy, by Mr. Green; Platylóbium trilobatum, splendidly flowered, also by Mr. Green; Borónia serrulata, by Mr. Bruce and Mr. Barnes, from a foot to 18 inches high, exceedingly compact, with partially drooping branches, and flowering finely; a larger plant of the same species, 3 ft. high, and 3 ft. across, by Mr. Hunt, gr. to Miss Traill; Borónia denticulata, the shoots of which had been so frequently stopped, as to render the bush impervious to the hand, by Mr. Clarke, gr. to T. Smith, Esq., and by other growers; Borónia crenulata, 3 ft. high, well cultivated and bloomed by Mr. Hunt, gr. to Miss Traill; Selago Gilliesi, spreading and pretty, by Mr. Clarke; Pimelea decussata, finely grown by many individuals; Pimelea spectábilis, with about 30 heads of its attractive blossoms, by Mr. Hunt, gr. to Miss Traill; Epacris ceræflora, 18 inches in height, and covered with snowy bloom, from Mr. Goode; a Dillwýnia, most like D. speciosa, trained to an oval-shaped trellis, by which half of its numberless flowers were turned away from the beholder, by Mr Hunt, gr. to Miss Traill; Chorozema Dicksonii, 1 ft. high, stunted, yet flowering freely, by Mr. Green; Platylóbium parviflorum, constituting a mass of yellow flowers, 4 ft. in height, by Mr. Chalmers, gr. to A. Johnston, Esq.; and Rhododendron Gibsoni, an Indian species, with the habit of an Azálea, and large pinkish white fragrant blossoms, from Mr. Paxton, gr. to his Grace the Duke of Devonshire. Shrubs of taller growth include Cytisus racemosus, quite a tree, from Mr. Goode; Eriostemon cuspidatum, 6 feet high, and healthy in the extreme; Erythryna Crista-galli, highly vigorous, and with flower-spikes 3 ft. in length; Anthrocercis viscosa, 6 ft. in height, and in perfect health, Telópea speciosíssima, equally high, and alike healthy; a crimson variety of Rhododendron arbóreum, magnificently in bloom, all from Mr. Goode, gr. to Mrs. Lawrence: Chorozema cordata, gracefully spreading to 6 feet in diameter, and all its branches terminated with flowers, from Mr. Clarke, gr. to T. Smith, Esq., Shirley Park; and a small but elegant plant of the same, from Mr. Hunt, gr. to Miss Traill; Eutáxia myrtifólia, forming a small tree, 5 ft. in height, and all its branches completely surrounded with blossoms, by Mr. Flogan, gr. to H. Pownall, Esq., Spring Grove, and Mr. Green; Epacris grandiflora, from 4 to 6 ft. high, and literally a thicket, by many cultivators; Hóvea Celsi, 5 feet high, by Mr. Jackson, of Kingston, and Mr. Green, most magnificent plants; Chorozema várium, very fine, from Mr. Barnes; Polýgala oppositifólia, by Mr. Bruce, gr. to B. Miller, Esq., 5 ft. in height, and indescribably handsome; and Telópea speciosíssima, in a robust state, though not finely in flower, from Lady Cockburn. Among Fúchsias there was a noble plant, by Mr. Green, of a variety of Standíshii: it was 6 ft. high, and exceedingly graceful. A new hybrid, of a very similar character, was brought by Mr. Davis, gr. to Lord Boston: it was dwarfer, with denser and shorter and redder flowers than F. Standíshii. Mr. Conway, of Brompton, exhibited F. Monypénnii, which has exceedingly fine, long, and rich red flowers, and is altogether a splendid hybrid. From Mr. Frost, gr. to Lady Grenville, at Dropmore, was furnished a brilliant new seedling Verbena. The flowers are large, and of a dazzling hue, between deep scarlet and crimson; its habit is dwarf, and it appears to be a most desirable variety. A new Podolóbium, allied to staurophyllum, and procured from the Swan River colony, was shown by Mr. Barnes: it is very ornamental. The Pelargoniums were splendid: Mr. Cock in this department still maintained his ascendency; he exhibited 12 magnificent specimens (not for competition): it is impossible to convey a just idea of the appearance of these plants; their large size, regular form, and abundant bloom, were such, that surely the cultivation of this beautiful flower cannot be carried further. Orange Boven, Garth's Victory, Bridesmaid, and Coronation were perfect and covered with bloom, and though the others presented no deficiency of flowers, it was suggested by some growers that two or three days more would have improved the remainder. Mr. Catleugh, in the nurserymen's class, gained the gold medal for 12 finely-bloomed and neatly-trained plants; they were well selected as regards colour and the beauty of their flowers. The collection consisted of the following sorts:—Erectum, Coronation, Garth's Victory, Una, Comte de Paris, Sylph, Orange Boven, Climax, Magna Charta, Lady Mayoress, Ovid, and Eliza superb. These plants were grown short, and trained rather flat on the crown, and as the Pelargoniums were exhibited under the eye, these had the advantage of being seen in perfection. Erectum and Orange Boven were perfect, fine in colour, and covered with bloom. Those who doubted the possibility of producing the Sylph with a fine head of bloom, had an opportunity here of being convinced of their error, as this plant was in splendid condition; so also were the Lady Mayoress, Comte de Paris, Victory, and Coronation. Mr. Gaines, among his 12, exhibited some very fine specimens, but how could a grower of his experience allow such a flower as Diadematum rubescens to make its appearance in his collection? nothing but dire necessity, we should imagine, could have sanctioned its being there. Foster's Matilda was shown in this collection, in a very fine state, no want of bloom, and with the spot in fine colour and well developed. The Emperor, a flower of extraordinary colour, was very attractive from its brilliancy. The collection contained the following sorts: Matilda, Emperor, Climax, Alicia, Juba Mabel, Grace Darling, Grand Duke, Seedling Eliza superb, Diadematum rubescens, and Raffaelle. In the collection of six varieties, Mr. Catleugh exhibited Coronation, a magnificent specimen of Discount, Garth's Victory, Jewess, Climax, and Eliza superb. Mr. Gaines had Lady Bulteel, Grand Duke, Louis Quatorze, Climax, and two others we did not ascertain the names of. Each of these collections received the same award—the highest prize offered by the Society. They were very attractive from their being so finely grown, and shown in such perfection. Mr. Beck was the most successful exhibitor in the Amateurs' Class; his plants were well grown, but not sufficiently in bloom; the selection of the sorts was unexceptionable, as the following list will show: Nymph, Sultan, Matilda, Erectum, Vivid, Vulcan, Rienzi, Deborah, Gipsy, Sylph, James, Hebe. There is no doubt, had Mr. Bromley exercised the same judgment in the choice of his plants, Mr. Beck would not have been so successful, as the plants in Mr. Bromley's collection were generally well-grown and well-bloomed; the state in which Lady Denbigh, Victory, Jewess, Discount, and Dennis' Perfection were exhibited, will bear us out in our opinion; but, in the present state of this beautiful class of flowers, to see such sorts as Lady Murray, Diadematum rubescens, and Garth's Perfection, with but a few blossoms expanded, was a circumstance sufficient to condemn any collection; and to this cause we attribute the decision that was given. Mr. Stowe's collection was not well managed; they appeared to have been tied up so short a time before the exhibition, that the flowers and leaves had not had sufficient time to recover from their altered position. There was no deficiency of bloom on the plants. At the end of the tent a single specimen (Florence) was exhibited by Mr. Cock: a magnificent plant, covered with flowers. Those who were in search of novelties, flocked to the small tent appropriated to the exhibition of seedlings; this tent was much crowded—a proof of the interest taken in Floricultural productions. Several seedling Pelargoniums were shown, but two only selected for prizes—Symmetry, raised by the Rev. R. Garth, a beautiful flower; the under petals have a broad band of very delicate pink, which is changed to white in the centre; the upper petals have a blotch of deep maroon, a little softened at the edge, with a broad band of pink round them. The plant was exhibited (which is the best mode of showing seedlings), as evidence is at once obtained of its being a free bloomer, with good-sized trusses. Gaines's Amulet was the other seedling selected; a very finely-form [illegible] wer—the under petals particularly fine; the flower is novel in appearance; the ground colour is rather a deep rose, carried round the spot in the upper petals by a broad band. There were other seedlings meriting attention, but not shown in their greatest perfection; we think this was the case with Gaines's Orange Perfection, a beautifully-coloured flower. Mr. Pontey's seedlings were seen under great disadvantages; the distance they had had to travel had no doubt caused the petals to flag and to reflex; one called the Duke of Cornwall—a flower of extraordinary brilliancy of colour—we trust to see again under more favourable circumstances. The June show will prove the great contest for seedling Pelargoniums; and we hope to see as many as possible exhibited on the plants. A seedling Calceolaria, raised by Mr. Standish, named Standishii, was much admired, and selected for a prize: the ground colour is yellow, and the flower is covered with large brown spots; it blooms very freely. Mr. Green had a considerable number of new varieties. Pállida is a very pale yellow flower, spotted in the centre, and rather fine; Ne plus ultra has very large blooms, deep yellow round the edge, pale and spotted towards the middle; Eliza has a whitish border, with a dark crimson centre, and is a large and good flower; Sulphúrea grandiflora is an immense sulphur-coloured flower, with just a few minute spots; Georgina has blossoms with a whitish edge, and a dark brownish crimson centre, a little streaky: it is a particularly fine flower; Regina has a light border, with a dark crimson middle, which is slightly streaked round the outside; its dimensions are very great. Mr. Kinghorn, gr. to A. Murray, Esq., Twickenham, produced one called Maculata: it has a yellow ground, and is profusely spotted with brown; although neither large nor well formed, it is pretty. Another, named the Queen of Sheba, with a pale edge, light crimson centre, and dark spots in it, is large and good; it was brought by Mr. Barnes, gr. to G. W. Norman, Esq. A stand of fine Tulips, from Mr. Willmer, of Sunbury, attracted its fair share of notice: the mixture of delicate and richly-marked varieties had a fine effect; many of the blooms were in great perfection. Among the Bybloemens we particularly noticed the Princess Charlotte's Cenotaph, Ely's Queen Victoria, Holmes's King, and David; and in the Roses, Triumph Royal, Aglaia, and Catalani, were very fine. Captain White, Polyphemus, Platoff, Lawrence's Bolivar, and the Sultan (a most beautifully-formed flower), were conspicuous among the Bizarres. Mr. Willmer also exhibited a Rose, recently broke into colour, called the Prince of Wales, a beautiful flower, of a bright vermilion rose. Several excellent stands of Pansies were brought forward, and two seedlings were sent by Mr. Brown of Slough: one, the Unique, has a whitish ground, with purple edges, and a dark eye, surrounded with a yellowish tint; the other, Attila, is a very large purplish puce-coloured flower, with a yellow streaked centre. Cut Roses were various, and in good condition, from Messrs. Lane, of Berkhampstead; and a plant of Rosa Devoniensis, in a pot, was exhibited by Mr. Redding, gardener to Mrs. Marryatt. The Fruit tent was not filled so well as could have been wished; still, considering the season, some of the fruit was highly creditable to the producers. Mr. Paxton sent from Chatsworth, the seat of his Grace the Duke of Devonshire, some fine Grapes, Fairchild's Nectarine, particularly good Cherries, Strawberries, and Elruge Nectarines, a May Duke Cherry tree laden with ripe fruit, and a gigantic cluster of the fruit of Musa Cavendíshii. Half-a-dozen splendid Providence Pines were exhibited by Mr. Davis, gr. to Lord Boston: and there were some good Queen Pine Apples present. Of Grapes, there were fine Sweetwaters, by Mr. Henderson, gr. to Sir G. Beaumont, and tolerably good Muscat of Alexandria; Black Portugal and others were well ripened by Mr. Paterson, gr. to Lord Chesterfield; Sweetwater and Black Hamburgh were in an excellent state from Mr. Wortley, gr. to F. Maubert, Esq., Norwood, Surrey; Black Hamburgh, of a superior character, were brought by Mr. Judd, gr. to G. Knott, Esq., and Mr. Loudon, gr. to S. Gurney, Esq., Upton, West Ham, Essex; and the New Black Hamburgh, as well as the Sweetwater, were supplied in a superb style by Mr. Wilmot, of Isleworth. Admirable Peaches and Nectarines were furnished from Mr. Henderson, gr. to Sir G. Beaumont; and there were pretty good ones from Mr. Tillery, gr. to his Grace the Duke of Portland, at Welbeck; from whom also, as well as from Mr. Clarke, gr. to T. Smith, Esq., there were excellent Strawberries. Lord Beerhaven and Mr. Tillery likewise supplied some very large Shaddocks. Mr. Hardie, gr. to J. Jarratt, Esq., exhibited two handsome early Cantaloupe Melons; Mr. Baldwin, of Turnham Green, 18 sorts of Apples, in an excellent state of preservation; and there were some well-kept Apples and Pears from R. Brake, Esq. The Cucumbers embraced six Heroes of Sussex, from Mr. M'Farlane, gr. to J. R. Mills, Esq., of Stamford Hill; Allen's Victory of Suffolk, from Mr. Allen, of Whitton, Suffolk; and two good brace from Mr. Pollington, gr. to W. Harvey, Esq. There was a dish of new Potatoes, from Mr. Chapman, and some remarkably large Broccoli, called Chappell's Cream, from Mr. Farnes, seedsman, 128, St. John-street, London. In one respect, the fruit-tent was more satisfactory than the rest. Nearly all the productions were labelled with their names; whereas the flowers were very generally destitute of labels. A few exhibitors had furnished them, it is true; but it is much to be regretted that the practice is not universal. We must now beg those who had valuable plants at the exhibition, which have not been alluded to in this report, to attribute our silence concerning them to a want of additional space; and if, amid the confusion almost inevitable in the making of so many memoranda, mistakes in the names of plants or parties should have arisen, any corrections, coming from a proper quarter, will readily be inserted hereafter.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

May 11.—H. Handley, Esq., President, in the chair. The Right Hon. Lord Bateman, and Sir J. Walsh, Bart., M. P., were elected governors, and 40 gentlemen members. The council having resumed the consideration of the place of the annual country meeting in the north-eastern district in 1843, determined that it should be Derby. Mr. Gabell addressed a letter to the council, requesting them to ascertain whether the excessive use of the large white Belgian carrot as food for horses had a tendency to induce blindness. This was referred to Professor Sewell. Mr. Taylor having presented a coloured drawing of the Melilotus creticum, transmitted the following account of the plant:—"A few seeds were sent me from the island of Crete, under the name of the Melilotus creticum, as a plant that would be found highly useful for feeding cattle. The seed was sown the 25th March; the plants produced flowers in June, and by the middle of July were covered with highly fragrant yellow blossoms, and ripened seed in Aug.: height of the plant 20 inches. The Melilotus creticum seems to be a valuable plant, and well calculated for growing in this country. It possesses all the properties sufficient to recommend it to the notice of agriculturists, particularly as its stalks are succulent and its foliage abundant; and when sown in autumn, it may be cut and cleared from the ground in the beginning of June following, and the land fallowed for Wheat or spring corn. It forms a valuable green food for cattle at an early period of the season; and if cut when in full flower, it yields a most abundant crop. It seems to be relished by all sorts of cattle, particularly milch cows, in consequence of its sweet herbaceous flavour, whether cut in a green state for food, or made into hay, and is a plant well adapted for the latter purpose, on account of its foliage when dried being found to impart to the whole crop an agreeable sweet scent, similar to that of the vernal grass, or Anthoxanthum odoratum. From its beautiful yellow spikes of flowers, it will form an elegant ornamental plant in every garden.—Sir F. A. Mackenzie, Bart., said that he had at length succeeded in obtaining a breeding stock of Swiss bulls, which for the last 23 years he had been most desirous to secure for this country, and that four of the finest that Switzerland could produce were on their way to England, and would arrive in the course of a few days. The Marquis of Downshire presented a specimen of a cheap draining tile, 12 inches long, and sold at 25s. per thousand. The chief recommendation is its cheapness and its peculiarity, the form into which its lower edges are turned outwards into a foot, its transverse section (or cross cut) resembling the outline of the letter U inverted, thus ∩; this shape allowing the tiles to be piled together more compactly in the kiln, and when used, to be capable of having their course kept more clear for the passage of the water.

FLORICULTURAL SOCIETY.

May 17.—Mr. Wildman in the chair. Messrs. Schroder, Neville, Seldon, O'Grady, and Alexander, were elected members.—Mr. Wildman alluded shortly to the insinuations of partiality which had been made against the Society, with regard to his White Seedling Dahlia "Bianca," by parties who, seeing that there was no chance of making the Society subservient to private purposes, had recourse, as a last expedient, to unfounded imputations, in order to destroy the unwelcome check that had been imposed upon the system of deception too often practised. He at the same time stated, that having wholly disposed of the flower, he had no other interest in it than that which was dictated by a becoming feeling for its success; that, looking to the source from whence these attacks had emanated, the more judicious course might have been to pass them by unheeded, but as he was desirous to bring the matter to an issue, in an open and public manner, without entering into personal collision with parties whose society he would wish to shun, an opportunity would be afforded, in consequence of the purchasers of the flower having declined to dispose of it during the present season, to carry his intentions into effect; he would therefore offer a prize of Five Guineas for the best White Seedling Dahlia of the year 1841, upon the following terms: That 6 Blooms should be shown before the Floricultural Society, at their ordinary meeting on Tuesday, 6th Sept.; 6 Blooms at the Salt Hill Show, on the 16th Sept.; and 6 Blooms at this Society's Show, on 20th Sept.: the prize to be awarded to the flower which should be adjudged the best on two out of the three occasions. In order, however, that their actual as well as comparative merits should be decided, the whole prize of 5gs. will not be awarded unless the successful flower should be pronounced to be first-rate; but should it be only of the second class, the prizes would be reduced to half the amount. And further, with the view of bringing all the old as well as new flowers into competition at the same time, an entrance of 3s. 6d. would be imposed upon each exhibitor for the prize of 5gs., and the amount of the entrance money added to the usual prizes offered by the Society on the 20th Sept., for the best White Dahlia of any age in Class showing.

SOUTH LONDON FLORICULTURAL SOCIETY.

May 18.—This meeting was held at the Horns Tavern, Kennington. The attendance was very numerous, and the subjects of exhibition, particularly the Tulips, Pelargoniums, and Ericas were of the highest order. The following is a list of the prizes:—TULIPS: *Amateurs*, for the best 12, large silver medal, Claudiana, Transparente noire, Roi de Navarre, Imperatrice de Romaine, Sir Sidney Smith, Triomphe Royal, Julia Romana, Ali Pacha, Catalani, Holmes' King, Reine de Sheba, Polyphemus, Mr. Venables. 2nd best do., middle silver; Sangia, Alcon, Comte de Vergennes, Page's George IV., Baggut, Preciosa, Roscius, Prince Leopold, Lord Russell, Daphne, Ophir, Triomphe Royal, Mr. Reeves. *Nurserymen*, for the best 12 do., large silver; Polyphemus, L'admirable, Triomphe Royal, Brulante éclatante, Princess Charlotte's Cenotaph, Marcellus, Mellona, Catalani, Bijou des Amateurs, Rose Quarto, Alcon, Platoff, Mr. Willmer. 2nd best do., middle silver; Marcellus, Byzantium, Bijou des Amateurs, Catalani, Surpasse Pompe Funébrè, Brulante éclatante, Rose Aglaia, Sheet Anchor, Duchess of Clarence, and three others whose names we could not obtain, Mr. Lawrence. PELARGONIUMS: *Nurserymen*, for the best collection of 12, large silver; Viscount, Magna Charta, Sylph, Life Guardsman, Ovid, Climax, Orange Boven, Jewess, Victory, Coronation, Lady Mayoress, Comte de Paris, Mr. Catleugh; 2nd best do., middle silver, Hodges' Emperor, Louis Quatorze, Raphael, Diadematum rubescens, Delicatum, Grand Duke, Sylph, Exquisite, Climax, Lady E. Bulteel, Lady Palmer, Matilda, Mr. Gaines. Best 6 Ericas, large silver; E. suaveolens, odorata, translucens, hýbrida, Hartnelli, vestita alba, Mr. Curtis, gardener to J. Alnutt, Esq. Best 9 do., middle silver; E. Hartnelli, élegans, vestita coccínea, grandinosa, ventricosa coccínea minor, perspícua nana, depressa, physoides, princeps, var., Mr. Jackson. Best 24 Heartsease, *Amateurs*, middle silver, Mr. Edwards; 2nd best do., small silver, Mr. Bridges. Best 36 do., *Gentlemen's Gardeners*, middle silver, Mr. Hancock. Best 50 do., *Nurserymen*, middle silver, Mr. Thompson; 2nd best do., small silver, Mr. King. Best Collection of 24 Miscellaneous Plants, large silver; Mr. Atlee, gr. to J. Beaufoy, Esq. Best 4 Specimen Plants, large silver; Ixora coccínea, Helichrysum húmile, Coleonema tenuifólia, Fúchsia corymbiflora, Mr. Bruce. Best single Specimen, middle silver; Borónia pinnata, Mr. Atlee. 2nd best, small silver, Helichrysum húmile, Mr. Bruce. Best seedling Heartsease, small silver, Mr. King. Best Collection of 4 sorts of Fruit, middle silver; Grapes, Strawberries, Pears, and Gooseberries, Mr. R. Chapman. Best dish of Grapes, middle silver; Black Hamburg, Mr. Chapman. Best Collection of Vegetables, middle silver, Mr. Martin; 2nd best do., small silver, M. Gaines. There were also collections of Tulips from Mr. Townley, Mr. C. Clarke, Mr. Sanders, Mr. Stockwell, Mr. T. May, and a stand of 100 from Mr. Willmer, containing excellent flowers of Polyphemus, David, Duke of Clarence, Optimus, Holmes' King, Triomphe Royal, Albion, Platoff, and Sangia; of Heartsease, from Mr. Walton, Mr. E. Fyffe, Mr. W. Foster, Mr. Gaines, Mr. Henchmann, Mr. Henbrey, Mr. Lake, and Mr Butcher; of Heaths, from Mr. Atlee, Mr. Wilson, gr. to W. H. Gilliard, Esq., and Mr. Storey; of Pelargóniums and Canceolárias, from Mr. Beck of Isleworth; Seedling Calceolárias from Mr. Massey; Greenhouse Plants from Mr. Atlee; Seedling Geraniums from Mr. Gaines, amongst which were Lady Sale, Prince of Wales, Amulet, Rising Sun, Emperor Superb, and a lovely one called the Princess Royal, of an excellent form, and a delicate pink colour, with a rich dark spot in the upper petals; a fine plant of Azálea Gledstanésii, from Mr. Bruce; Zichya coccínea, from Mr. Atlee; Amaryllis Sweetii, from Mr. Cook; and some of the Black Spine Cucumber, from Mr. Cuthill.

COUNTRY SHOWS.

Felton Florists' Society, May 3d.—The first exhibition of Polyanthuses, Auriculas, and Hyacinths, for this season, was held at the Red Lion Inn, when the following prizes were awarded:—Polyanthuses: the 1st and 2nd prizes to Mr. W. Thompson, for Mitchell's Lord Nelson, and Wilson's Bucephalus; 3rd, Mr. W. Harrison, for Clegg's Lord Crewe; 4th, Mr. W. Thompson for Mitchell's Lord Collingwood; 5th, Mr. Riddell, gr. to J. H. Hinde, Esq., M.P., for Fletcher's Defiance; 6th, Mr. W. Harrison, for Pearson's Alexander. Auriculas: 1st prize, Mr. A. Gowens, for Dormand's Don Pedro; 2nd, Mr. W. Harrison, Dormand's William IV.; 3rd and 4th, Mr. A. Gowens, for Lord Bridport and Lancashire Hero; 5th and 6th, the Rev. Jos. O. Orrell, for Grimes' Privateer, and Thompson's Bang-up. Hyacinths: 1st and 2nd prizes, Mr. Forsyth, gr. to A. J. B. Cresswell, Esq., M.P., for Lord Wellington, and Groot Voorst; 3rd, Mr. Riddell, gr. to Mrs. Mitford, for Waterloo. Prize for the best Seedling Polyanthus, Mr. Forsyth, for Forsyth's Cresswell Heroine. A number of Seedling Pansies were also exhibited by Mr. Forsyth, but not for competition, and were much admired. The flowers exceeded those of any former Spring show, and the Polyanthuses were particularly fine, and chiefly new varieties. The Auriculas, although good, were many of them not quite fully expanded. The exhibition of Tulips was appointed to take place at the Widdrington Arms Inn, on Monday, the 30th inst.

Hull and East Riding of Yorkshire Floral and Horticultural Society, May 3.—This society held their first exhibition for the present year in the new rooms of the Mechanics' Institute. The articles were numerous and splendid, and reflected the highest credit on the cultivators. The judges were Messrs. Deighton, Eggleston and Keld, and the prizes were as follows:—Auriculas: Premium by Sir W. C. James, Bart., M.P., to W. Heslewood, Esq., for Oliver's Lovely Ann; do. by H. Broadley, Esq., M.P., to Mr. H. S. Norman, for Oliver's Lovely Ann; do. by R. Bethell, Esq., to J. Hodgson, for Leigh's Bright Venus. Green-edged: 1, W. Heslewood, Esq., Oliver's Lovely Ann; 2, do.; 3, Mr. T. P. Smithson, Lancashire Hero; 4, Mr. H. S. Norman, Howard's Lord Nelson; 5, W. Heslewood, Esq., Leigh's Col. Taylor; 6, Mr. H. S. Norman, Stretche's Alexander. Grey-edged: 1, Mr. H. S. Norman, Oliver's Lovely Ann; 2, do., Kenyon's Ringleader; 3, W. Heslewood, Esq., Waterhouse's Conqueror of Europe; 4, do.; 5, do.; 6, do., Oliver's Lovely Ann. White-edged: 1, Mr. J. Hodgson, Leigh's Bright Venus; 2, W. Heslewood, Esq., Taylor's Glory; 3, do.; 4, Mr. J. Hodgson, do.; 5, Mr. H. S. Norman, do.; 6, do., unknown. Self: 1, Mr. H. S. Norman, Whitaker's Flora's Flag; 2, do., seedling; 3, W. Heslewood, Esq., Netherwood's Othello; 4, Mr. T. P. Smithson, do.; 5, W. Heslewood, Esq., Whitaker's Flora's Flag; 6, do. Alpine: 1, Mr. H. S. Norman, Miller's Conspicua; 2, W. Heslewood, Esq., Captain Frazer; 3, do.; 4, Mr. H. S. Norman, Miller's Conspicua; 5, W. Heslewood, Esq., do.; 6, Mr. Bell, Brown's seedling. Polyanthuses: Premium by the Right Hon. Lord Wenlock, to W. Appleton, gr. to Dr. Horner, for Clegg's Lord Crewe. Scarlet: 1, Mr. H. S. Norman, Buck's George IV.; 2, do.; 3, Mr. T. P. Smithson, do.; 4, Mr. T. Jones, do.; 5, Mr. Burman; 6, do. Dark: 1, Mr. W. Appleton, Clegg's Lord Crewe; 2, do., Pearson's Alexander; 3, Mr. H. S. Norman, do.; 4, Mr. W. Appleton, Lord Wharncliffe; 5, Mr. T. Jones, Pearson's Alexander; 6, do., Crownshaw's Invincible. Hyacinths: Premium by Sir W. Lowthorp, to Mr. H. S. Norman, for Groot Voorst; do. by W. Heslewood, Esq., to Mr. T. D. Dobson, for Groot Voorst. Double White or Yellow: 1, Mr. H. S. Norman; 2, W. Heslewood, Esq.; 3, Mr. H. S. Norman; 4, Mr. S. Appleton, gr. to A. Terry, Esq.; 5, Mr. T. D. Dobson; 6, Mr. W. Burman. Double Red or Pink: 1, Mr. T. D. Dobson; 2, do.; 3, do.; 4, Mr. W. Burman; 5, do.; 6, Mr. S. Jackson. Double Blue or Purple: 1, Mr. T. D. Dobson; 2, W. Heslewood, Esq.; 4, Mr. H. S. Norman; 5, do.; 6, do. Single White or Yellow: 1, Mr. W. Burman; 2, Mr. Bell; 3, Mr. S. Jackson; 4, Mr. S. Appleton; 5, do.; 6, Mr. Burman. Single Red or Pink: 1, Mr. H. S Norman; 2, Mr. Bell; 3, Mr. Burman; 4, Mr. T. D. Dobson; 5, Mr. Burman; 6, Mr. T. D. Dobson. Single Blue or Purple: 1, Mr. T. D. Dobson; 2, Mr. H. S. Norman; 3, Mr. Burman; 4, Mr. H. S. Norman; 5, Mr. S. Jackson; 6, Mr. T. D. Dobson. Narcissuses: 1, Mr. S. Jackson; 2, Mr. T. P. Smithson; 3, do.; 4, do. Solitary-flowered: 1, 2, 3, Mr. T. P. Smithson. Greenhouse Plants: Premium by C. S. Parker, Esq., for the first collection of not less than six varieties, to W. Heslewood, Esq. Premium by J. England, Esq., for the second collection of not less than six varieties, to Mr. S. Appleton; for the third collection, to Mr. T. Jones. Single Greenhouse Plants: Mr. S. Appleton, Tropæolum tricolorum; 2, W. Heslewood, Esq., Erica rubra calyx; 3, Mr. S. Appleton, Kennedya nigricans; 4, do., Acacia armata; 5, Mr. H. S. Norman; 6, W. Heslewood, Esq. Hardy or Half-hardy Plants: 1, W. Heslewood, Esq., Rhododendron ponticum; 2, Mr. H. S. Norman, Rose, German yellow; 3, Mr. S. Appleton, Fuschia globosa; 4, Mr. Jones, Rhododendron ponticum; 5, Mr. S. Appleton, Calceolaria; 6, Mr. Burman, Ely's Magnificent Carnation. Cucumbers: Premium by Richard Sykes, Esq., to Mr. S. Jackson, Manchester Hero; 1, Mr. S. Appleton, do. Apples: 1, 2, 3, 4, Mr. T. P. Smithson; 5, Mr. S. Jackson; 6, Mr. Taylor, gr. to J. Hewetson, Esq. Judges' Prizes: To Mr. S. Appleton, for a Dish of Pears. To do., for a Tray of Pansies. To Mr. Eversden, for Victoria Rhubarb.

Kent and Canterbury Floral and Horticultural Society, May 5.—The second exhibition took place at the Corn Exchange, on which occasion there were a numerous attendance of visitors, and a good display of plants. The following were the successful competitors: FRUIT; Best Strawberries: Keen's Seedling, Rev. W. Brockman; 2nd, ditto. Best 8 dessert Apples: Nonpareil, R. Francis, Esq.; 2nd best ditto, Courtpendu plat, ditto. Best 6 kitchen Apples: Norfolk Beaufin, Rev. G. P. Marsh; 2nd ditto, London Pippin, R. Francis, Esq. Best 6 Pears: Beurré Rance, ditto; 2nd ditto, Longueville, ditto. VEGETABLES: Best Kidney Beans, Rev. W. Brockman. Best Rhubarb, Victoria, F. Sankey, Esq.; 2nd ditto, Rev. W. Brockman. Best Lettuce: Mr. R. Filmer. Best Endive: T. Dorman, Esq. Best Broccoli: Mrs. Webb. Best Sea-kale: Rev. W. Brockman. Best new Potatoes, 1842: Mr. R. Filmer. Best basket of Salading, without cucumbers: Mrs. Webb. Best Asparagus: F. Sankey, Esq.; 2nd ditto, J. Kates, Esq. FLOWERS: Best 4 Calceolarias: Seedlings, T. Dorman, Esq.; 2nd ditto, Victoria, Garth's No. 2, and two others, F. Sankey, Esq.; best 3 ditto, two of them Seedlings, T. Dorman, Esq. Best 6 Pelargoniums: Gem, Sidónia, Hill's Cupid, Melpómene, Miller's Adonis, Prima Donna, Mrs. Webb; 2nd ditto, Hector, Sidónia, Beauty of Ware, Lowndes' Perfection, Atkins' White, Miller's Splendidissima, ditto; best 4, King, Jewess, Alicia, Joan of Arc, W. Hyder, Esq.; best 2, King, Alicia, ditto; best stove plant, Aloe plicatile, T. Dorman, Esq. Best Fuchsias: F. racemiflora, Youelli, Rev. W. Brockman; 2nd, Virgata, Globosa major, Mrs. Webb; best single, F. fulgens, Rev. W. Brockman. Best 3 Roses: Swiss, two Provins, Mrs. Webb; best Rose, F. Sankey, Esq. Best 6 greenhouse Plants: Brugmánsia sanguínea, Helichrysum album, Caméllia pleno alba, Helichrysum rupestre, Acácia armata, Sempervivum arbóreum, G. Buckley, Esq.; best 4 ditto, Acácia armata, A. pulchella, A. verticillata, A. mollíssima, Denne Denne, Esq.; best 2 ditto, Epacris grandiflora, Asclépias curassávica, W. Hyder, Esq. Best 3 Cacti, in flower: speciosus, Ackermanni, speciosissimus, J. Cates, Esq.; best 2, Ackermanni, speciosissimus, ditto. Best 2 Indian Azáleas in flower: A. grandiflora, A. indica alba, Denne Denne, Esq. Best 2 Cape Heaths, Erica intermédia, E. Hartnelli, Rev. W. Brockman. Best 6 Annuals: T. Dorman, Esq.; best 4 ditto, ditto. Best 2 green-edged Auriculas, Oliver's Lovely Ann, Howard's Lord Nelson, T. King, Esq.; 2nd ditto, Oliver's Lovely Ann, Wood's Lord Lascelles, ditto; best 2 grey ditto, Chilcott's Brilliant, Burch's Violet, ditto; 2nd ditto, Grimes' Privateer, Burch's Violet, ditto; best 2 white, Highland Queen, Taylor's Incomparable, ditto. Best Polyanthus: ditto. Best 3 Cinerarias, Grandesse, Harrisoni, Green's Seedling, Rev. W. Brockman; best 3 Bulbs, Ixia viridiflora, Amaryllis aúlica, A. formosa, Mrs. Webb. Best 3 greenhouse Creepers: Tecoma Pandora, Kennedya monophylla, Brachysema latifolia, G. Buckley, Esq. CUT FLOWERS: Best basket of hardy Flowers: Rev. G. P. Marsh; 2nd, J. Cates, Esq. Best nosegay of greenhouse plants: Rev. G. P. Marsh; 2nd, G. Buckley, Esq. Best 12 Pansies: Diogenes, Victory, Sylvia, Ward's Amulet, Lane's Wellington, Thompson's Duchess of Richmond, May's Imogene, May's Tam O'Shanter, Henchman's Aurora, Beauty of Hitchin, Queen of the Isles, Silverlock's Prince Albert, Rev. J. Hodgson; 2nd ditto, Mr. R. Filmer. Best collection of indigenous plants in flower: Lady Grey de Ruthvyn. EXTRA: Collection of indigenous plants: T. Addis.

Lancaster Horticultural Society, May 13.—The first Show of this season took place in the National School-room, Green Area. The following is a list of the prizes:—Tulips: the best Pan, one in each class, Charles Tenth, Bizarre le non, Black Baqueta, Duchess of Lancaster, Walworth, Unique, Mr. Richardson; 2nd best Pan, Duke of Wellington, Albion, Black Baqueta, Premier Noble, Duc de Bronte, Walworth, Capt. Wilkinson; 3rd best Pan, Duke of Lancaster, Surpasse la Cantique, Black Baqueta, Premier Noble, Lady Crewe, Seedling Rose, Mr. Walmsley. Feathered Bizarres: Duke of Lancaster, Catafalque, Ambassadeur d'Hollande, Mr. Walmsey; George the Fourth, Duke of Wellington, Goud Beurs, Rector, Black Baqueta, Maître Partout, Gastilla, Mr. Richardson; Trafalgar, Washington, Mr. Hargraves; Duc de Savoy, Golden Hero, Incomparable Bien-fait, Thompson's Violet, Grande Imperiale, Neat and Clean, Messrs. Hargreaves. Feathered Roses; Dolittle, Walworth, Duc de Bronte, Comte de Vergennes, Lady Crewe, Hero of the Nile, Mr. Richardson; Holden's Rose, Capt. Wilkinson; Heroine, J. Stout, Esq.; Naverin's Lady Crewe, Messrs. Richardson. Flamed Bizards: Lustre, Defiance, Capt. Wikinson; Albion, Surpasse la Cantique, Bell's King, Messrs. Hargreaves; Duchess of Lancaster, Black Prince, Madame de France, J. Stout, Esq. Flamed Byblœmens: Pompey's Pillar, Violet Wallers, Imperatrice de Maroque, Unknown, Mr. Walmsey; Roi de Siam, Princess of Wirtemberg, Mr. Richardson: Imperatrice de Romaine, Transparente Noire, Capt. Wilkinson. Flamed Roses: Roi de Cerise, Rose Domingo, Capt. Wilkinson; Van Dicken, Unique, Messrs. Hargreaves; Rose Imperiale, J. Stout, Esq.; Rose Vesta, Mr. Hargraves; Fox Globe, Mr. Walmsey; Unknown, Lord Hill, Mr. Richardson. Seedlings: 1st, Capt. Wilkinson; 2nd, Mr. Walmsey; 3rd, Mr. Richardson. There were various other collections of Flowers, the property of ladies, principally Geraniums, Azáleas, Heaths, Clematises, and Roses. The most successful exhibitors were Mrs. Ford, Mrs. E. G. Hornby, and Mrs. Godson. The Vegetables were not numerous, consisting chiefly of Rhubarb, new Potatoes, French Beans, and Cauliflowers.

Sheffield Auricula Show, May 10.—This was held at the Bazaar Hotel, where the following prizes were awarded:—Green edged: Premier, Leigh's Colonel Taylor, Mr. J. Archer; 1st, Waterhouse's Conqueror of Europe, Mr. W. Bradshaw; 2nd, Taylor's Plough Boy, Mr. B. Morton; 3rd, Howard's Lord Nelson, Mr. J. Wood; 4th, Lightbody's No. 51, Mr. W. Bradshaw; 5th, Seedling, do.; 6th, Seedling, do. Grey-edged: Premier, Waterhouse's Conqueror of Europe, Mr. W. Bradshaw; 1st, do., do.; 2nd, Fletcher's Ne plus ultra, Mr. B. Morton; 3rd, Lightbody's No. 84, Mr. W. Bradshaw; 4th, Ryder's Waterloo, Mr. J. Wood; 5th, Ringleader, do.; 6th, Seedling, Mr. W. Bradshaw. White-edged: Premier, Lightbody's Fair Maid, Mr. W. Bradshaw; 1st, do., do.; 2nd, Leigh's Venus, Mr. J. Archer; 3rd, Lightbody's Fair Flora, Mr. Bradshaw; 4th, Poppelwell's Conqueror, Mr. J. Wood; 5th, Lord of Hallamshire, Mr. J. Archer; 6th, Seedling, Mr. W. Bradshaw. Selfs: Premier, Flora's Flag, Mr. B. Morton; 1st, Martin's Eclipse, Mr. W. Bradshaw; 2nd, Flag, Mr. J. Archer; 3rd, Blue Bonnet, Mr. W. Bradshaw; 4th, Miss Martin, do.; 5th, Martin's Mayfield, do.; 6th, Seedling, do.—POLYANTHUSES. Dark ground: Premier, Crownshaw's Eclipse, Mr. B. Morton; 1st, Alexander, Mr. J. Archer; 2nd, Crownshaw's Invincible, Mr. B. Morton; 3rd, Seedling, Mr. T. Jeffrys; 4th, Coxe's Prince Regent, Mr. W. Bradshaw; 5th, Seedling, Mr. W. Bradshaw; 6th, do., do. Red ground: 1st, Bullock's Lancer, Mr. W. Bradshaw; 2nd, Prince Regent, Mr. J. Archer; 3rd, Jolly Dragoon, Mr. W. Bradshaw; 4th, Buck's George the Fourth, Mr. B. Morton.—Best stand of 18 PANSIES, Mr. J. Bell; 2nd, Mr. W. Green.

MISCELLANEOUS.

On Green-manuring.—The following trial of manuring with green crops was made by Herr Zahlbruckner in the year 1839-40, and was communicated to the Agricultural Society of Vienna at the meeting in April last year. Three pieces of ground were selected for trial: No. 1 was treated as a clean fallow, and afterwards thickly manured; No. 2 was sown twice with Vetch seed, and when the plants had grown were ploughed in; No. 3 was sown with Lupine seed, and treated in the same manner. The first piece of ground contained about 800 square yards, the two latter about 400 square yards each. The Vetches and Lupines were both strong in their vegetation, and the first crop of the former were ploughed in at the end of June, and the second crop with the Lupines in the middle of August. In the middle of September all three portions were sown with winter Rye, in the proportion of three pecks of seed to the acre; in all three pieces the plants appeared about the same time, the green-manured a day or two sooner. No difference was observable in the character of the young plants, and each crop passed through the winter of 1839-40 without any injury; and in March 1840, when the snow and ice had melted away, little or no difference was perceivable in the crops. At the time of flowering, the fallow and Lupine plots were more vigorous than that of the Vetch; and at the time of the ripening of the new seed, the Lupine plot had attained the highest and strongest growth. In thrashing the corn, the following was the result of these experiments: No. 1 delivered $32\frac{3}{4}$ pecks to the Austrian acre; No. 2, the Vetch-manured, yielded $26\frac{2}{8}$ pecks per acre; No. 3, the Lupine-manured, yielded $34\frac{1}{2}$ pecks per acre. In some previous experiments made in the year 1833, the green-manuring with the Lupine yielded a larger produce than the thickly-manured fallow. That the Vetch-manured did not produce so large a quantity of seed as the Lupine, may be ascribed to the heat to which it was exposed during the latter part of the season; but still, the result proves the value of this kind of manuring. This mode of providing manure for Corn crops may be of great importance in those cases which sometimes occur, in which the farmer cannot obtain the requisite quantity of animal manure. Although these experiments in some measure contradict the recent doctrine, that all manures are derived from the inorganic kingdom, yet the *practical* farmer will not fail to avail himself of this ready way of obtaining manure. This mode of manuring may be conducted with other plants, especially those with large or abundant leaves. The families of Cruciferæ and Chenopodiaceæ offer an abundance of species fit for this process; and there are numerous common weeds which might also be employed for the same purpose, without any expense. The *Madia sativa* would also be a good plant for green-manuring.—Abstracted from *Verhandlungen der K. Landwirthschafts-Gesellschaft in Wien.*

Fossil Plants.—We abridge the following amusing account of Professor Goeppert's discoveries from "The London Journal of Botany:"—"Fossil wood, fossil leaves, fossil bones, and fossil *infusoria;* all these things we have long heard about; but M. Goeppert, who, being a botanist, naturally seeks for flowers, has had the rare good fortune to detect the blossoms of the world before the Flood! This is true to the very letter; he has gathered him a bouquet of these more than patriarchal flowers, he has seen their buds, their corollas, their propagation, nay, he has gone near to perceive their perfumes! And much more than all this, M. Goeppert has set himself to detect the mode in which nature has so wrought as to turn these most delicate of all substances into stone: thus perpetuating that which a breath of wind is sufficient to destroy, and moulding into a geological specimen what a finger's touch will fade! So patient, so sagacious is he, that he has caught the secret of this mechanism, and thus enables us to discern the transformation of the temporal to the eternal, and the metamorphosis of what is fragile into what is durable: he has actually *made fossil plants!* This is the man who might be expected to enter a drawing-room, wearing a fossil rose, like a badge, in his button-hole: and if ever such an *Order of Savans* be instituted, M. Goeppert is the person to be made its president.—Let us cast a glance on the apartment where our Breslau Professor passes many hours in meditation. There are 236 fragments of transition rocks, such as we tread upon in the Ardennes and on the banks of the Meuse; 1548 pieces of coal, similar to what you would burn any day and perceive nothing remarkable in it; 35 blocks of variegated freestone, of the same kind as served to build the cathedral of Strasbourg, and those churches in Mayence where M. Victor Hugo could see nothing but plaster-of-Paris monuments; 122 specimens of lias from the coasts of Britain, in which English ladies have detected real antediluvian monsters; 242 heaps of green sandstone and of chalk; 742 portions of lignite and of turf; and 259 of those small flat slabs, which, on the banks of the Rhine, are employed for the purpose, when put into the hogsheads, of giving fresh spirit to wine which is a century old. Such is M. Goeppert's museum. In the coal of Silesia and of other countries, M. Goeppert has discovered and obtained several plants still flexible, and which admitted of his dissecting their epidermis and organs of evaporation; and he has thus been enabled to ascertain how subterranean combustion has destroyed the tissue in other plants found in the same formation. He detected, in the Keuper formation, the branches of a tree analogous to the Birch, on which the flowers and pollen were still perfectly preserved; and some fir-trees presented him with a similar phenomenon. It is well known, that in the north of Europe, there occasionally falls from the skies an enormous quantity of a yellow powder, which was once supposed to be sulphur, but which savans have pronounced to be the pollen of the Fir-blossom. Now, in Westerwald, Finland, Bohemia, and even in New York, this floral substance has been discovered in such great quantities deposited between layers of earth, and mingled with fossil Infusoria, that M. Goeppert is enabled to pronounce that the antediluvian world must have also possessed its enormous forests of gigantic Pines, whose yellow dust could not but obscure in its fall the light of day, since the masses of it are so thick and close-pressed as even to raise the soil many feet. We have already said that M. Goeppert MAKES fossil plants, and to prove how fossilisation has actually taken place, this ingenious man so works with clay, fire, and water, on a given plant (and chiefly with the Ferns, those vegetables of which the geological productions of our globe present the most perfect specimens), that he produces, in the course of one year, by this moist process, such samples, and so admirably imitated, that even a connoisseur, if not forewarned of the deception, might mistake them for genuine fossils. Antiquaries, we know, will sometimes manufacture fictitious medals; at Baiæ, the poorest blacksmith sells his yesterday's productions for Roman antiquities; art may imitate art; but imitation must have reached its utmost perfection when it can simulate antediluvian nature. In the cabinets of the curious we often see flies and other insects enclosed in amber. M. Goeppert has examined the amber of various lands, and has detected not only animals, but Mosses, Fungi, Hepaticæ, Ferns, Flowers, and Fruit, embedded in it; and on these Flowers the minutest organ is preserved, as in a mummy balm; nay, he has actually discerned those microscopic hairs which adorn the velvetty substance of flowers similar to those of our Heartsease."

GARDEN MEMORANDA.

H. Bevan's, Esq., Twickenham.—This villa is delightfully situated on the banks of the Thames; and the gardens, although not extensive, are remarkable for neatness and good cultivation. Amongst the fruiting Pines we observed Buck's Seedling, which, we were informed, never swells to any great size or weight, although it attains to an enormous length. The fruit in the present instance was nearly a foot long, while its diameter did not exceed 3 inches. In the Peach-houses and Vineries, which are heated by hot-water pipes, there is an excellent contrivance for preserving a moist atmosphere. It is the invention of Mr. Lumsden, the gardener, and consists of troughs formed of burnt clay, about a foot long, and two or three inches deep, made circular beneath, so as to fit closely to the pipes. These are much preferable to the iron ones now in use, since they can be filled with water, which may remain for any length of time without becoming impure or oxidised, and is always fit for mixing with cold for watering plants. The abundant crop and healthy foliage of the trees bear sufficient testimony to the beneficial results derived from this method. A good plan of obtaining fruit from yearling Vines raised from eyes is also practised here. Being struck early in the spring, and allowed plenty of pot-room, those plants which show the most fruit the second season are selected, and the pots being broken from them, are planted without disturbing the balls, in a small pit within one of the Vineries. Some which we saw treated in this manner were each of them showing six or eight well-formed bunches. One house is devoted to the forcing of Figs; among the sorts pointed out to us as being well adapted for this purpose was a small kind, called the Egremont. The Greenhouse contains some handsome seedling Calceolarias and well-grown Pelargóniums; amongst the latter was a fine seedling, called Lumsden's Madeleine. The form is good; the colour, a beautiful deep rose, with the upper petals darkly clouded. Mr. Lumsden has also raised a great number of seedlings from Gloxínia rubra, crossed with the white and other varieties. These are invariably of a dark blue colour, and bear a great resemblance to G. caulescens. In the Orangery were some fine specimens of Ericas, and in bloom were E'chium grandiflorum, presenting a dense mass of blue and purple flowers, Saxifraga ciliata, and a noble plant of Cýtisus racemosus. A Mushroom-house has lately been erected upon a novel principle. The exterior walls and ceiling are hollow; the latter is arched over with brick-work, allowing a space of at least two feet between it and the roof. In the winter, this cavity can be filled with straw or hay to keep out the cold; while, in the summer, it can remain empty, and will then serve as a refrigerator to preserve the house cool. By applying litter or any other non-conducting material to the exterior walls, it is expected that this plan will answer without artificial heat.—*R. A., May 16.*

Reviews.

The Nature and Property of Soils; their Connexion with the Geological Formation on which they rest; the best Means of permanently Increasing their Productiveness, and on the Rents and Profits of Agriculture, &c. &c. By John Morton. 3rd Edition enlarged. 8vo. Ridgway. 1842.

No farmer who wishes to improve the productiveness of his land can dispense with this work, the nature of which is truly expressed by its title-page. The various rocks, as geologists call them, are successively examined, the properties of the soil produced by them is explained, and practical directions are given for improving them. Then, after thus separately considering them, their general nature is pointed out, and the general principles of improving them are discussed. The merits of different systems of culture are ably examined, and suggestions are offered for introducing agricultural improvements. Finally, there is an excellent letter, full of practical wisdom, on the absolute necessity of adopting the best and most efficient means of managing a farm, which, although addressed to the tenants of Mr. Pusey, M.P. for Berkshire, is applicable to the circumstances of light-land farmers generally. Those who neglect the precepts of Mr. Morton are throwing away the best chances of improving their circumstances.

The following extract will give our readers an idea of the manner in which Mr. Morton treats his subject:—"The productiveness of any soil, we think, depends entirely on its natural or artificial capability of retaining or transmitting its moisture, the vehicle at least by which nourishment is conveyed to plants. This productive power may therefore not only be continued in its greatest vigour, but greatly increased by proper management. When we by any means give to the soil a permanently-increased vegetative power, we also increase the yearly produce which it yields. Some soils produce large crops often repeated without manure; five crops of corn and a fallow are the conditions entered in some leases in the neighbourhood of Wisbeach in Lincolnshire, while other land will produce nothing without great expense of culture and manure, nor will an excess of manure make such land permanently productive; but if we change its constituent parts by the addition of those earthy materials of which it is deficient, so as to bring it nearer to the nature of those soils which we know to be fertile, then we shall permanently increase its productive powers. Water being the vehicle by which nourishment is conveyed to plants, the soil whose constituent parts are best adapted for retaining a sufficient supply and transmitting a proper portion in very dry weather to the plants growing in it, without holding it in injurious quantities in the time of very wet weather, is possessed of the principle of vegetation, and will be found to be of the most productive nature. Such a soil will give not only firmness to support the plants, but will facilitate the growth of their roots in search of moisture and nourishment to the greatest depth. There is not an individual who cultivates a garden, and who exercises his judgment in its culture, but knows that the addition of clay gives cohesion to sandy or gravelly soils, and that sand and gravel when mixed with a clayey soil diminish its tenacious property; and that these changes, thus effected, permanently increase the productive powers of both. In our endeavour to improve barren soils, we should examine them in connexion with fertile soils in their neighbourhood, on the same geological formation; and the difference of their constituent parts may lead us to the means of their improvement. If the cause of sterility be owing to some defects in their composition, these defects should be supplied. An excess of silicious sand is improved by the application of clay, peat earth, or calcareous matter, cold well-rotten manure, and rolling or trampling with sheep or other stock, to consolidate its texture. When clay is in excess, it is remedied by the application of sand, chalk, marl, or burned clay, light unfermented manures, and perfect pulverisation, to make the soil friable. An excess of vegetable matter in a dormant state, as in peaty soils, is corrected by burning, by the application of clay, sand, calcareous matter, gravel, rubble, or anything heavy, to give firmness to the soil. Lime not only destroys the injurious effects produced by sulphate of iron, which abounds in some soils, particularly in those of a peaty and silicious gravelly nature, but is said to convert the sulphate of iron into a manure. None of these applications, however, will have the desired effect, unless there be first a perfect subsoil drainage of all superfluous moisture, conjoined with a perfect tillage. Stagnant water, in any soil, melts down the particles of matter which compose it, and joins them together in close contact; it prevents the air and water from circulating amongst the roots of the plants, and they therefore die. When a clayey soil has been thus closed together by stagnant water, it requires to be perfectly drained, and it can only be recovered by repeated ploughings and harrowings, together with the pulverising influence of frost to bring it into a fit state for vegetation, and if it has been long under water, it acquires a pernicious quality, which can only be got quit of with great difficulty;—fallowing, and the application of lime, has a great effect in reviving it. The first principles of agriculture, which are shown by the best practice, are few; they may be stated to be these:—make and keep the land perfectly dry, and clean, or free from weeds; make and keep the soil, which is too adhesive or too loose, of such a friable nature, as will make it receive, retain, and transmit moisture, and thus fit it to produce the most luxuriant state of vegetation; restore to the soil, as a manure, in a state of decay, the greater part, if not the whole, of the produce after it has been consumed by sheep or other stock. Never manure any land till every weed is exterminated, for weeds grow most luxuriantly in the soil to which they are natural: if any of them are left, they will outgrow the plant you intend to cultivate, and take up the greatest quantity of the manure laid on the land."

CALENDAR OF OPERATIONS *for the ensuing week.*

As dry weather seems to have set in again, it may not be amiss once more to remind our readers of the great importance in such a season of frequently stirring the surface of the ground among growing crops of every kind. The advantage derived from the destruction of weeds before they perfect and shed myriads of seeds, and thus supply materials for numberless future hoeings, much more than counterbalances the trifling extra labour which for a short time is required; but besides this, the loosening of the surface is conducive to the vigorous growth of the plants, probably by retaining a more equable degree of temperature and moisture in the soil about their roots. In addition to these and other benefits, there is the gratification of seeing a neat and well-kept garden, instead of a slovenly wilderness of weeds.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Where young plants were shifted betimes, and the roots not unnecessarily mutilated, some of them will have filled their pots, and will consequently require repotting. This can easily be ascertained by taking a few plants by the neck and lifting them up, when they will readily leave the pots if well rooted. If such is found to be the case, take out all the plants, repot those which require it, and top-dress those which do not, affixing some mark to the latter by which they may be known when watering, as these will require a larger quantity than the newly-potted plants. If the heat of the bed has gone off, renew it by turning and watering, adding a little fresh bark if necessary, especially if the bed has sunk below the curb-stone of the pit. To obtain stocky plants, which always produce the best swelled fruit, they should be placed as near the glass as practicable during their season of growth.

Vinery.—Continue to thin advancing fruit as necessary; that is, when the berries are fairly formed. Stop laterals as they appear, and do not suffer the strength of the Vines to run to waste in any way. Plants in pots, particularly those intended for fruiting next year, must be encouraged to grow vigorously by plenty of food, and to form perfect wood by free exposure to light. Use rich soil in repotting, and train the shoots so that the leaves may be within a few inches of the glass. If not otherwise occupied, the front of the early Cherry-house may be devoted to this purpose.

Peach-house.—Trees which root inside the house will require occasional waterings in addition to that supplied by the engine. Always use pond or rain water, when procurable. If it is wished to forward the ripening of fruit that is swelling off, gentle fires may be continued at night, otherwise artificial heat is no longer necessary.

Cherry-house.—See that the foliage of the trees in the succession-house is perfectly clean before the fruit begins to ripen, as it cannot be cleaned afterwards without injuring the fruit.

Fig-house.—If the directions heretofore given have been followed, some of the Figs will now be nearly or quite ripe, in which case the plants should have less water; yet the supply must not be so greatly or so suddenly diminished as to risk the failure of the second crop, which is now showing itself, if the shoots have been stopped early, as recommended.

Mushroom-house.—Follow the directions formerly given to keep the atmosphere of the house humid rather than water the beds; but if the latter operation becomes necessary use chilled water, and give a sufficient quantity at once to moisten the soil quite through.

Cucumbers and Melons.—When Melons are full grown, and before they begin to ripen, give the soil a good watering if it appears at all dry; this, if the surface of the soil is covered, will suffice till the most forward fruit has been cut. Earth advancing crops, as required, and cover every addition of soil with sand or tiles, to check evaporation and preserve a regular state of moisture. Plant out Gourds and Vegetable Marrows in rich soil, sheltering them for a time with hand-glasses; or if these are all occupied, large flower-pots might be put over the plants every night.

Out-door Department.

Cabbages.—Earth-up all that are large enough, while the ground is moist.

Cardoons.—Make the last sowing. If the two previous sowings run to seed, this will not.

Celery.—Put out a few rows of the largest plants, removing them with all the roots that can be preserved, and afterwards well watering them.

Endive.—A little might be sown, which will be less likely to run than that put in three weeks since.

Garlic, Shallots, and autumn-sown Onions should be hoed between, and the flower-stalks, if any appear, broken off.

Kidney-Beans.—Plant out in a warm place those sown in boxes and forwarded in heat. If put close to the front of some of the hothouses these plants will produce Beans before those sown in the open ground.

Potatoes.—Earth-up the early sorts, much or little, according to the habit of the variety to form tubers, more or less, near the surface of the ground.

Rhubarb.—Unless seed is wanted, this ought not to be permitted to flower; neither should too many of the leaves be taken off for use.

Spinach.—Thin-out the young plants. If the winter crop is no longer wanted, the ground it occupies might be bastard-trenched, or deeply dug, and the Spinach will form manure for the plants which succeed it.

Turnips.—Thin the young plants sparingly at first, on account of their liability to be taken off by the flea-beetle. The earliest crops must be watered in dry weather, or they will soon run to blossom.

Orchard.—When the fruit of Cherries and Plums are all set, the trees should be well washed, by means of an engine, with soap-suds from the laundry, which will kill any of the black aphides that may have made their appearance, and likewise assist in relieving the fruit from the dead remains of the flowers. Keep all wall-trees, and more especially young ones, free from insects. As the principal young shoots are destined to form future branches, every assistance ought to be afforded to their perfect development. The health and longevity of the full-grown tree depend very materially upon this important point. If Gooseberries are wanted to grow very fine, thin-out all the smallest berries, and mulch the trees with good manure.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—The plants may now be thinned, and part of them removed to the greenhouse; this will allow the whole more room to grow. Attend to the training of Creepers; put in cuttings, and pot off others which are rooted. Look carefully after snails and slugs, which now abound in almost every Orchidaceous-house.

Greenhouse and Conservatory.—Set your house in order as soon as the plants intended to summer in cooler quarters, or in the open air, are all removed. The places of these should be occupied by Globe Amaranthuses, Balsams, Browállias, Ipomopsis, Cockscombs, and other showy tender annuals which have been brought into bloom in the pits and frames. Many plants usually kept in the stove, such as Gloxínias, Cacti, Gesneras, Amaryllises, Thunbérgias, &c., may also now be taken to the greenhouse, where they will remain longer in beauty.

Pits and Frames.—Some of these being now empty, the plants which occupied them having been transferred to the flower-garden beds and to the greenhouse, more space can be allowed to plants for blooming in pots late in summer and in autumn. Where there is a large conservatory to decorate, a succession of tender annuals should be kept up for that purpose. To grow these fine, give them rich soil, plenty of pot-room, a high temperature, and all the light possible by placing them near the glass.

Out door Department.

Continue the filling of all vacant beds in the flower-garden. Plant out all Dahlias that are sufficiently strong; likewise tender climbing annuals, such as Convolvulus major and Tropæ'olum peregrinum. In case any vacancies occur in the mixed flower-borders after the early annuals and pot plants are put out, they may be filled up with seeds of the most showy annuals, many of which will bloom at a season when flowers are scarce. Tie up the stems of Carnations and Pinks, previously reducing them to a proper number, according to the strength of the plants. Hoe and rough-rake shrubbery and other dug borders; for this and similar jobs take advantage of a hot and dry day.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Follow the directions given last week.

Forest and Coppice Woods.—Whenever bark is dry enough let it be housed immediately in an airy barn, or other fitting shelter. The timber and all its appendages should likewise be got off the ground as soon as practicable.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending May 19, 1842, as observed at the Horticultural Garden, Chiswick.

May		Barometer.		Thermometer.			Wind.	Rain.

The highest temperature during the above period occurred on the 25th, 1833, and 27th, 1841—thermometer 82°; and the lowest on the 25th, 1839—thermometer 29°.

REPORT ON COVENT GARDEN MARKET,

For the week ending May 20, 1842.

Owing to the continued cold weather the supply of some kinds of Vegetables has been rather limited. Fruit is more plentiful, and trade, during the week, has been much brisker *Fruit.*—Pines are exceedingly fine, and higher in price than they have been for many weeks past, being from 10*s.* to 16s. per lb. Grapes are also of superior quality, and are selling from 6*s.* to 10*s.* per lb. Peaches and Nectarines are rather more plentiful, but still maintain a high price; from 20*s.* to 30*s.* per dozen. Cherries are somewhat dearer, but much improved in quality, at 25*s.* per lb. Green Apricots have fallen from 1*s.* to 6*d.* per pottle. The supply of Apples has been tolerably good; the dessert kinds are from 6*s.* 6*d.* to 14*s.* per bushel, and the kitchen kinds from 5*s.* to 11*s.* per bushel. Plenty of good Strawberries may be obtained from 4*d.* to 1*s.* per oz. Green Gooseberries continue much the same as last week; and there are also some Currants, selling at 6*s.* per half sieve. The price of Cucumbers is the same as in our last report. *Vegetables.*—Cauliflowers are becoming more plentiful, but still keep a high price, ranging between 4*s.* and 18*s.* per dozen. We observed some immense Broccoli from Cornwall, which sold from 6*s.* to 8*s.* per doz. The supply of Asparagus has not been very good, and the best still fetches from 4*s.* 6*d.* to 5*s.* 6*d.* per bunch. Some Peas have appeared during the week, and are selling from 30*s.* to 40*s.* per half-sieve. New Potatoes are becoming more abundant, the Kidneys fetch from 9*d* to 1*s.* per lb., those from Cornwall from 3*d.* to 6*d.* per lb. Young Carrots and Turnips have improved during the week; so also have Lettuces, which are selling about 1*s.* per score. Rhubarb is abundant, and Myatt's Victoria is fetching from 10*s.* to 12*s.* per doz. bundles. *Flowers.*—These have been well supplied, and amongst them we noticed many rare kinds; consisting of cut blooms of Cacti, Combretum purpureum, Clematis azurea, Ixias, Gardenias, and Ericas.

PRICES Saturday, May 21, 1842.—*FRUITS*:—

Apples, Kitchen, per bush. 3*s* 6*d* to 7*s*
— Dessert, per bushel, 5*s* to 14*s*
Strawberries, forced, per oz., 4*d* to 1*s*
Peaches, per doz. 20*s* to 30*s*
Nectarines, per doz., 20*s* to 30*s*
Apricots, green, per pottle, 6*d*
Pine Apple, per lb. 10*s* to 16*s*
Grapes, hothouse, per pound, 6*s* to 10*s*
Oranges, per doz., 9*d* to 2*s* 6*d*
— per 100, 5*s* to 20*s*
— Bitter, per 100, 7*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 16*s*
Cucumbers, per brace, 1*s* to 3*s*
Cherries, per lb. 25*s*
Gooseberries, Green, per half sieve, 6*s*
Currants, Green, per half sieve, 6*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Walnuts, per bushel, 16*s* to 24*s*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, White, per doz. 6*d* to 1*s* 6*d*
Cabbage, Red, for pickling, 2*s* 6*d* to 3*s*
Cabbage Plants, per doz., 2*s* to 4*s*
Broccoli, White, p. bnch., 2*s* to 4*s*
— Green, 1*s* 6*d* to 2*s* 6*d*
Cauliflowers, per doz., 2*s* to 14*s*
Peas, per half sieve, 30*s* to 40*s*
Kidney Beans, forced, p. 100, 2*s* to 3*s* 6*d*
Potatoes, per ton, 50*s* to 80*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 1*s* 6*d* to 2*s*
— Kidney, per bush. 2*s* to 2*s* 6*d*
— New, per pound, 4*d* to 1*s* 3*d*
— — Cornish, 3*d* to 6*d*
Turnips, young, per bunch, 6*d* to 2*s* 6*d*
Carrots, young, per bunch, 6*d* to 2*s*
Parsneps, per dozen, 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* to 8*s*
Radish, per doz. hands (24 to 30 each) 6*d* to 1*s*
— Turnip, p. doz. bch., 6*d* to 1*s* 6*d*
Spinach, per sieve, 9*d* to 1*s*
Chives, per pot, 3*d*
Leeks, per dozen bunches, 1*s* to 1*s* 6*d*
Garlic, per lb. 1*s*
Shallots, per lb., 2*s* 6*d*
— Green, per bunch, 3*d*
Onions, per half sieve, 3*s* to 4*s* 6*d*
— for pick., per hf.-sieve, 4*s* to 5*s*
— Green, per bch., 1*d* to 6*d*
Asparagus, per 100, large, 5*s* to 6*s*
— Second or Middling, 3*s* to 4*s*
— Sprue, or Small, 1*s* 6*d* to 2*s*
Lettuce, Cabbage, p. sieve, 2*s*
— Cos, 6*d* to 2*s*
Endive, per score, 1*s* 6*d*
Celery, per bundle (12 to 15) 6*d* to 1*s* 6*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch. 4*d* to 6*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Tarragon, per dozen bunches, 3*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s*
Mint, per dozen bunches, 2*s* to 3*s*
Marjoram, per doz. bunches, 2*s*
Basil, per doz. bunches, 2*s*
Rhubarb Stalks, doz. bundles, 4*s* to 9*s*
Mushrooms, per pottle, 9*d* to 1*s* 3*d*

Notices to Correspondents.

J. Briggs.—Your Apple is the Wellington.

R. L E.—The plant you sent is Gnídia imberbis.

G. B.—An Arnott Stove placed within 2ft. of the stem of a Vine, will not be injurious to it, provided that it is not overheated, and that the escape of smoke is prevented; taking care at the same time always to have a pan of water placed upon the stove, to prevent the atmosphere from becoming too dry. Dahlias will not flower so well from old roots as from cuttings. The cause of your young stocks dying off just above the surface of the soil, is owing to their not being kept regularly watered. The mould by this means becomes hard, or encrusted, and the plants being fully exposed to the sun, in a few hours flag and perish in the manner described. You had, therefore, better place them in a cooler spot, where they can be shaded during the heat of the day, and be careful that they never want water.

Antirrhinum.—Your plants are,—1, Alopecurus pratensis; 2, Lúzula campestris; 3, Lúzula Fórsteri; 4, Anthoxanthum odoratum; 5, Carex pilulífera; 6, Stellária holóstea; 7, Asplénium adiantum nigrum.

Lomax.—We would not advise you to paint your hot-water pipes with sulphur too frequently, for fear of destroying your plants, as well as the Red Spider. By far the safest plan, after you have reduced their numbers by the above process, is to keep your houses or pits moist; this will soon restore the leaves to your Fúchsias, Verbenas, and other plants.

J. Atkinson.—The white-edged Auricula named Thorpe's Queen Victoria came to hand. Of course we see it under great disadvantage, from its having been cut two days before it was sent, and the cotton-wool in which it was enveloped having smeared the surface of the flower. It is, therefore, impossible to speak with certainty of the quality of the paste, or the colour of the tube. The pip is round, but deficient in substance; the tube is well-proportioned, with the anthers rather too much sunk; the paste, which is probably of a good quality, wants defining on the outward edge, which is too broken and feathery; this we consider the greatest defect in the flower, as it makes the paste appear too wide, and robs the coloured ring of its just proportion and character; the colour is intensely dark, and the edge very white. There is a deficiency of white-edged varieties, and this will doubtless prove a very acceptable addition to this class.

Philo-Geranium.—Nothing can be said in favour of your seedling Pelargoniums. The Lilac family to which they belong is discarded from good collections. Your seedlings possess none of the properties that are now looked for in new varieties, viz.—the circular form, with the broad and stiff petal. If you examine your seedlings with impartiality by this standard, you will perceive that the general outline of your flowers wants due proportion; the petals are too thin and flimsy in texture, and too long and narrow in form. We have no wish by these observations to damp your ardour in the pursuit of a favourite object, and we therefore recommend you to procure the finest sorts, to save seed from which will greatly increase, and indeed form your only chance of success.

E. C.—We would advise you to take up your Jargonelle Pear-tree in the autumn, and plant it near the surface; at the same time cutting off all the roots which descend perpendicularly, but taking particular care not to injure the extremities of those which are left. There is no doubt but the chief cause of its unproductiveness proceeds from many of the principal roots having penetrated into a cold subsoil.

A Constant Subscriber's plants are,—1, Carex præcox; 2, Carex acuta; 3, Juncus squarrosus; 4, Stellária uliginosa; 5, Euphórbia pilosa; 6, Vaccínium uliginosum; 7, Lonicera tartárica; 8, Prunus Padus.

M. M. C.—The flowers of your seedling Verbena appear liable to come crumpled, otherwise it would be a desirable variety, being of an excellent colour, with a good dark eye.

L. V.—If you have plenty of room in your greenhouse or pits, you may pot off your Seedling Calceolarias separately into 60 or 48-sized pots, according to the size of the plants, afterwards repotting them as they may require; if not, you may turn them out into a border, keeping them well watered during dry weather, in which situation they will flower profusely during the latter part of the summer.

E. R.—The best introductory work for beginners is "Lindley's Elements of Botany."

W. D.—It is by far the best plan to cut off all the shoots of Asparagus up to a certain period, and then to desist entirely; but this cutting must not be continued too long.

Amateur's plants are,—1, Azálea nudiflora; 2, Ledum latifólium; 3, Cynanchum fuscatum; 4, Omphalodes verna; 5, Orígarum Dictamnus; 6, Genista canariensis; 7, Spiræa alpina; 8, Helichrysum proliferum; 9, Erica mediterránea; 10, Narcissus poéticus; 11, Marchántia polymorpha.

J. B. M.—If you will forward your address to Messrs. Youell, Nurserymen, Great Yarmouth, they will feel much obliged.

A Subscriber will find her question respecting liquid manure answered in the Amateur's Garden of this week's *Chronicle.*

A Young Gardener.—Your greenhouse will not be at all a suitable place for your Carnations when in bloom, especially with Vines trained along the rafters. The latest of your Pelargóniums may be repotted with advantage, but not such as are coming into bloom.

R. D.—Your plant is Mélia Azédarach.

J. L.—Your Oncídium is On. Cebolleta.

E. H.—Your plant appears to be Œnanthe crocata, a well-known and dangerous poison. It will form the subject of an early article on Familiar Botany.

Alpha.—A person who would become a botanist should begin with such books as Lindley's "Elements of Botany," and "Synopsis of the British Flora."

A Wellwisher.—The plants best adapted for forcing during the winter are the Moss, Provens, and Crimson Perpetual Roses; Kálmia latifólia, Gardénia radicans, Syringa pérsica, Andrómeda floribunda, Azáleas of all descriptions, Narcissuses, Tulips, Amaryllises, Hyacinths, Lilies-of-the-Valley, Cinerárias, Heliotropes, Pinks, and Pelargóniums.

Quidnunc.—It will be beneficial to your young Calceola'rias to nip off the flower-stems as soon as they form; if you keep them clear of the green-fly, and allow them plenty of pot-room, they will soon strengthen. We should imagine that half-a-pound of Tobacco would be sufficient to fumigate a house 25ft. by 16ft., but this must depend entirely upon the closeness of the glazing. There will be no occasion to mix moss with the tobacco, if that is kept in a damp place for a few hours previous to being used. The cause of the leaves of your Pelargóniums becoming "burnt" round the margins may be owing to the plants having become too dry during a bright sunny day. We never before heard of there being any difficulty in causing the tubers of Achimenes longiflora to vegetate; we cannot ascribe it to anything but the want of sufficient heat, if, as you say, the tubers are perfectly healthy.

C. E. F.—No. 1 is Ulmus montana; 2, U. campestris.

Agrimony.—Mix some flour-of-sulphur and water together, and paint it over the flues or pipes of your Vinery. This will destroy the Red Spider; but if you fumigate your house with sulphur, you will destroy the foliage of your Vines.

A Correspondent is desirous of knowing from some of the readers of the *Chronicle* what the best cure is for the crop in chickens. Will any one oblige us with a remedy?

T. S. R.—The plant seems to be Scilla verna. There is no botanical distinction between Mahónia and Bérberis; and Mr. Loudon did wrong in following those who have separated them.

Constant Reader.—In Paris there are, or were, fine trees of Magnólia grandiflora fully exposed to the winter without any other protection than a great heap of straw placed over the roots and bound by bands. In this country a south wall is preferred. The objection to an east wall is, that the leaves are apt to be cut by the dry and cold N.E. winds of spring; and that in a wet summer the wood will not ripen so fully as on a south exposure. It is not at all necessary to mat them up if near London, or to the south of it. We would recommend you to change the bog-soil in which your Magnolia is growing for good loam.

C. T.—The following are the characters of Mr. May's Fuchsias, according to the printed account that has been published of them:—Arborea grandiflora, an imported species from Mexico; of tall robust habit, flowering in large trusses; the flowers are one-half larger than Fulgens, the colour of which is bright scarlet, shaded off to orange, and the points tipped with green. Stylosa maxima, a hybrid with two crosses of Fulgens, being a seedling from Stylosa conspicua, recrossed with Fulgens, the flowers of which are longer, and of a light vermilion colour. Stylosa elegans, a hybrid with the same crosses as No. 2, the form of the flowers being more globular, and a distinct bright red: fine broad foliage. Pulchella, a hybrid with the same crosses as No. 2, flowers large and bright, foliage broad and much serrated; a free-bloomer. Usherii, a hybrid between Fulgens and Atkinsii; a neat and compact growing plant, the foliage bright shining brown, the flowers pink, tipped at the points with green. Inflata fulgida, a hybrid between Fulgens and Inflata, dark green glaucous foliage, flowers bright pink much expanded, points tipped with white and green.

A. Y.—Soap-boilers' ashes have been found very useful upon strong cold soils, on peat moss, and on cold wet pastures. As by far the most considerable portion of the ashes consists of lime and chalk, it will be necessary to apply them in quantities nearly as large as if lime itself was employed.

F. R. M.—The Night-smelling Wallflower is rightly named; it is the Mathiola tristis, and is too tender to endure the winter in the neighbourhood of London.

H. E.—You had better look over your Fúchsias and Roses, and dip all the shoots infested with the Green-fly into a pan or feeder containing tobacco-water.

A. Booth.—The letter you have sent on the destruction of Mice and Rats is almost a verbatim copy of an article printed in this Paper, p. 199, 1841.

A Constant Reader's plants are,—1, Anthýllis vulnerária; 2, Heliánthemum vulgare; 3, Cerástium viscosum; 4, Viburnum Lantana; 5, Lotus corniculatus; 6, Geranium lucidum.

Blunderbuss.—The proper season for summer pruning Plum-trees is July, as stated in Lindley's "Orchard and Kitchen Garden." The statement in last *Gardeners' Chronicle* to commence the pruning of wall-trees, related to disbudding them, or removing all fore-right or unnecessary shoots. Sketches of Pruning are in the hands of some of the contributors to the *Chronicle*, but they are rather long in forwarding them to us. Another article on the mode of managing Manures will appear next week. For Onions sown in drills 8in. apart; we should allow the same distance between each plant in the rows. If the drills are wider apart, this distance will be quite sufficient. There is no doubt but that Onions thinned to a moderate distance will swell more readily than when left very wide. We should say that the water which you use for your plants will not be injurious to them, although it rises from a spring; but as this is at the distance of 300 or 400 yards from your pond, it will be sufficiently exposed to the air in its journey, and after it becomes stationary. The remainder of your questions we will endeavour to answer next week.

Discipulus's larvæ are the offspring of some dipterous fly, possibly of a Bibio or a Tipula; but, unless we saw them alive, it is impossible to determine. A solution of salt, or lime-and-water, would probably destroy them. We have no idea that they were introduced with the tan-bark. These answers would have been published earlier, but the questions had to be sent into the country.—*R.*

Mr. C. A. Roeford's animals appear to be the Chelifer, or Phalangium cancroides of Linnæus. As they live upon Acari, we should consider them useful in destroying those and other little pests in the Melon-frames. Another species of Chelifer inhabits neglected collections of insects and dried plants, but it is for the purpose of feeding upon the Acari and Atropos which infest them. As the Chelifers secrete themselves in the damp frames, it is impossible to destroy them by any other application than boiling water or the fumes of sulphur.—*R.*

A Young Cabbage cannot, we fear, preserve his Peas and Beans from the attacks of the Curculio (Sitor) lineata, *Linn.* The only remedy we can suggest is to shake the plants at night over towels or white linen, previously spread close under the rows, upon which the Weevils will fall, and may be more readily collected than by hand-picking: they must be killed in boiling water.—*R.*

E. B.'s larvæ are the Caterpillars of the Phalæna (Hybernia) brumata, figured and described in the *Gardeners' Chronicle*, p. 812, Vol. I., where he will find the only remedies we are in possession of for the destruction of the moth and eggs at a later period. The Tomtits and small birds are the agents he ought to encourage to extirpate the Caterpillars.—*R.*

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The most important feature in our news from Paris is the announcement of M. Guizot that the French Government does not intend to ratify the right of search treaty for the suppression of the Slave Trade. The late railway accident is still the subject of painful interest, and a judicial inquiry into the causes which led to it has been instituted by Ministers, with the view of adopting measures to prevent the recurrence of the catastrophe. The prosecutions of the Press are still continued, and the Government appears determined to punish every departure from the strict letter of the law. The seizure of two journals during the past week, the one for neglect of the required legal formalities, and the other for imputing remissness to the judicial authorities in reference to the late railroad accident, has caused general alarm among the Opposition journals, but has excited little sympathy on the part of the public. The Railroad Bill, after a protracted debate, has passed the Chamber of Deputies by a large majority; and has been introduced into the Chamber of Peers, where it is also expected to pass without amendment.—From Spain we learn that the debate on the measure for the issue of Treasury Bills to the amount of 160 millions of reals has been brought to a more speedy termination than was anticipated, and that the Bill has been voted without modification. In a conversation in the Cortes on the rumoured intervention of foreign Powers respecting the marriage of the Queen, M. Gonzales, on behalf of Government, assured the Chambers that the Ministry will not allow any other country to interfere in a negotiation which belongs exclusively to Spain, and that they will regard as an offence any foreign intervention on the subject.—In Portugal a commission has been appointed to consider the question of a general reduction of the Tariff; the difficulties which have hitherto impeded the progress of the slave-trade treaty have at length been overcome, and it is expected that this important measure, together with the commercial treaty with England, will soon receive the ratification of Government.—Our German news is exclusively confined to the details of the late fire at Hamburgh. General sympathy is expressed for the inhabitants of that city, thirty thousand of whom are said to be deprived of their homes, and great exertions are making for their relief throughout all parts of the Confederation. Large sums of money and provisions have been forwarded to their assistance from the neighbouring States; and our readers will be gratified to learn that her Majesty and our own Government have united with the leading merchants in the Metropolis in contributing to this work of philanthropy.—By the Levant mail we have recent intelligence from Constantinople; the attention of the Divan has been occupied by the affairs of Syria, and a special minister has been despatched to inquire into the real state of the Lebanon, and to adopt measures calculated to conciliate the interests of all parties. The preliminaries of a convention with Greece have been agreed on, and the questions at issue between the two countries are likely to be speedily arranged.—Our intelligence from the United States is on the whole satisfactory; nothing of a positive nature is known respecting the important negotiations between Lord Ashburton and the Government, but we gather from the American journals that public opinion has undergone a favourable change, and that it is manifestly inclined to preserve a friendly understanding with this country.

At home, the re-assembling of Parliament last night after the Whitsuntide recess is the only topic which calls for special notice. In the Commons, the Ordnance and Navy estimates were proposed and agreed to; and several Bills of private or local interest were read a third time. Mr. Roebuck moved the first reading of a Bill from the House of Lords for the prevention of bribery; Sir J. Graham obtained leave to bring in a Bill to amend the acts for the commutation of tithes; and some other business of a routine character was transacted.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal continue well. The Queen and Prince Albert visited the Horticultural Gardens at Chiswick on Saturday. After inspecting the Gardens, her Majesty and the Prince honoured the Duke of Devonshire with a visit at his residence, and partook of a *déjeûné*. The Queen held a Drawing-room at St. James's Palace on Thursday, in celebration of her Majesty's birthday, which was numerously attended. On Friday her Majesty gave a concert at Buckingham Palace, for which upwards of 300 invitations were issued. The Court leaves Buckingham Palace for Claremont this day, where it will remain until after the Derby-day at Epsom, when her Majesty and Prince Albert will honour the Downs with their presence. A select circle of distinguished visitors will have the honour of being entertained by her Majesty at Claremont during the ensuing week. The morning papers state, that the Master of the Household, the Hon. C. A. Murray, on Wednesday ordered a suite of apartments to be prepared for the reception of several illustrious foreigners, who are expected to arrive on Monday or Tuesday next, on a visit to her Majesty, who will come to town from Claremont to receive her royal visitors.

Official Appointments.—The Queen has appointed Mr. M. L. Melville, in the room of Mr. W. W. Lewis, deceased, to be her Majesty's Commissary Judge in the Mixed British and Foreign Courts of Commission, established at Sierra Leone, under the treaties and conventions concluded with Spain, Portugal, Brazil, and the Netherlands, for the suppression of the slave-trade.

Parliamentary Movements.—Two Conservative candidates, Sir H. H. Bruce, Bart., of Downhill, and Mr. R. Bateson, son of the late representative, have come forward to contest the representation of the county of Londonderry, vacant by the retirement of Sir R. Bateson.

Foreign.

FRANCE.—*The late Accident on the Versailles Railroad.*—The recent catastrophe is still painfully kept before the notice of the public by the comments of the journals, and by the daily announcement of fresh deaths among the wounded. Considerable uncertainty still prevails with regard to the exact number of lives lost; the Ministerial organs estimating the number under fifty, while the remaining journals give it as upwards of a hundred. The general impression, however, appears to be that the latter estimate is most accurate. The papers are much occupied with minute details of the accident; but there is nothing of importance which was not reported in our last. Men under the superintendence of police officers have been employed in sifting the ashes at Meudon, and everything obtained is carefully preserved. Among the articles found are fragments of linen, laces, and other parts of dresses, a number of gold rings, a considerable quantity of money in silver and gold, and parts of watches, chains, and ornaments, gloves, canes, umbrellas, and various other things, which will in many instances serve to ascertain the names of those who have perished. One gentleman has found among these relics a chain and medallion which belonged to his young wife, to whom he had recently been married. One of the chief clerks in the office of the Minister of Finance has ascertained the loss of a young person to whom he was affianced, by seeing among these remnants the case of a watch he had presented to her; and a mother has found the fragment of a box, and a ring belonging to her only daughter, who went to Versailles with her cousin, on the day of the accident, but neither of whom had since been heard of. A variety of similar cases are related in the journals, but a great number of bodies still remain unrecognised. The "Moniteur," official organ, announces that the judicial inquiry into the causes of the accident began on the morning of the catastrophe; that numerous witnesses have been heard on the subject both in Paris and Versailles; and that after hearing the engineers and the persons who escaped, the whole proceedings will be submitted to the Seine Tribunal, to determine what measures may be devised, in addition to those already prescribed by Government, for preventing a recurrence of so melancholy an event. In the mean time, the Directors of the railroad, which was again opened on Saturday, have announced that, with the view of preventing similar accidents, the following alterations will in future be made in the trains:—1. The discontinuance of the four-wheeled locomotives, by one of which the accident was occasioned, and the use of the six-wheeled engines only. 2. The baggage waggons, usually placed behind the train will be placed between the engine and the passengers; and independently of this precaution, an additional waggon, loaded with stones and sand-bags, will follow the baggage one. 3. The speed will in no case exceed 22 miles an hour. 4. The doors of the carriages will be made so as to allow their being opened by the passengers. The Archbishop of Paris has ordered masses to be said in all the parishes of his diocese for the repose of the souls of those who have died in consequence of this accident; an example which has been followed by the Bishops of Versailles, Beauvais, Melun, and Orleans. The remains of Admiral Dumont D'Urville, the well-known circumnavigator, together with those of his wife and only child, who were burnt to death in one of the carriages, were interred with much pomp on Monday in the cemetery of Mont Parnasse. Admiral Duperré, Minister of Marine, was present, acccompanied by a large number of naval officers.

Right of Search Treaty.—The Cabinet has at length officially made known its intention not to ratify the right of search treaty, either before or after the elections; this determination was made known during an animated debate, on Wednesday, in the Chamber of Peers. The subject was mooted on the previous day, in consequence of some observations from the Marquis de Boissy, who read a manuscript on the treaty, which he said was supported by the combined efforts of the Ministerial journals of France and England. He designated M. Guizot as "the avowed organ of British interests in the Cabinet," an expression which produced considerable excitement in the Chamber, and loud cries of "Order" from all sides. M. Guizot, having stood up to reply, the President made a sign to him to sit down, and, turning to M. de Boissy, invited him to retract this offensive expression; but the latter having refused to comply with the invitation, he called him to order. M. de Boissy then concluded his speech amidst the murmurs and laughter of the Assembly. On Wednesday several Members, including Count Molé, took advantage of a discussion on the Supplementary Credits, to speak on the same subject, and strenuously opposed the ratification of the treaty. M. Guizot followed, and explained at great length the views and intentions of Government on the subject. Our space will not admit of our giving M. Guizot's speech at length, but the substance of it was, that Ministers have decided on not ratifying the treaty either before or after the elections. "In the present state of things" (says the reported speech of M. Guizot in the "Moniteur"), "and the actual disposition of the public mind, I should deem myself wanting in my duty towards the country, were I to advise the ratification of the treaty." Although, however, M. Guizot came to this conclusion, influenced, it is said, by political considerations, he demonstrated, by documentary evidence, that all the French Cabinets since 1834, including those of Count Molé himself, had laboured to extend the conventions of 1831 and 1833 to all Europe. He also established that, in Dec. 1838, Marshal Sebastiani, the French Ambassador in London, had signed, under the Molé Administration, a protocol for the negotiation of a treaty identical with that of 1841, except that a larger extension was given to the zones. Count Molé's explanation of this disclosure was, that he had not authorised Count Sebastiani to sign the convention, but that he did not think himself called upon, during the latter part of his Ministry, to disown this signature.

The Chambers.—The Railroad Bill, after a protracted discussion of seventeen days, has passed the Chamber of Deputies by a majority of 255 against 83. The debates since our last offer no feature of particular interest, with the exception of a speech by M. de Lamartine, which produced considerable effect on the Chambers. He argued that England would annihilate the commerce of France unless railroads were constructed. In the name of the committee of which he was the chairman, he defended the system before the Chamber. The committee acknowledged that to concentrate the power of the state on a single great line did at first appear a wise idea, and they had been struck with it. But present circumstances would not admit of this course, for the country was no longer free to choose where a line might be placed, as they already had scattered links of a vast chain, which could be connected without much difficulty. They had lines from Bordeaux to Teste, Paris to Marseilles, Paris to Orleans, &c., and it was impossible to direct their attention to a single grand line, when they had portions of others already begun. On Friday the bill was introduced into the Chamber of Peers, and on Monday the committee was named to draw up the report, six out of the seven commissioners being in favour of the measure. In the discussions in the upper Chamber the speech which has attracted the most interest, and is likely to command the greatest attention abroad, was that of Marshal Soult. The following is a summary of his observations, which were delivered at considerable length:—He said he had declared before the committee his opinion, that the vast system of railroads now proposed ought singularly to favour military opperations on the north and east. Lower Alsacia was evidently the point which an enemy would choose for entering France. That was so evident, so well known, that he committed no indiscretion in announcing it from the tribune. Once that the enemy had entered France, it could easily turn Strasburg, take the high road to Saverne, and reach the interior of the country. As far as the defence of the kingdom was concerned, he attached the greatest importance to the direct line from Paris to Strasburg, for Paris being a centre of concentration for troops, and at the same time the north containing a great portion of the army, it was absolutely requisite that Government could transport with the shortest delay 45,000 to 50,000 men, to stop up the entrance by Lower Alsacia. He was of opinion a branch line ought to be taken from the Strasburg railroad to Metz. In fact, Metz had become a strategic point, and an entrenched camp ought to be established there for the reception of all the troops coming from the North to meet an enemy penetrating by the quarter he had stated. As to the East, a line ought to pass by Dijon. If France were attacked, and an enemy had entered by Lower Alsacia, it would not enter by that point alone. An army would evidently endeavour to penetrate by the Alps, and the strategic point of that line was incontestably Dijon. The Chamber might recollect that when the Emperor wished to re-enter Italy, and was preparing for the battle of Marengo, it was at Dijon that he concentrated his forces. Therefore there was no doubt on the matter; Dijon was the strategic point. The two strategic railroads were, therefore, that of the Alps by Dijon, and of Strasburg by Metz, and the execution of these two lines was of the utmost importance for the defence of the country in a military point of view. The Bill was expected to pass the Peers as brought up from the Chamber of Deputies, without amendments.—The renewal of the Sugar Duties Bill for another year has been voted by a majority of 220 against 25. It has been officially announced, that immediately after the close of the present session, the import duties on hempen threads will be raised to 20 per cent.

The Press.—The "Temps," the organ of the Dufaure-Dupin Passy, or Middle party, was condemned, on Saturday, to various fines by the Seine Correctional Tribunal, amounting to 93,000 f., besides the suppression of the paper, for having been published without the formalities required for the responsible publisher, and for having fraudulently given in a false name as the depositor of the security exacted by the law. It was expected that this prosecution would be followed by many other indictments against the Opposition papers, as scarcely one was in accordance with the terms of the law, as to a *bonâ fide* security, and a really responsible publisher. The suppression of the "Temps" has caused considerable sensation among the journalists, but it does not appear to have excited any great degree of sympathy on the part of the public. The "National" has also been seized, and a prosecution commenced against the responsible editor, for some imputations upon the Procureur du Roi and other magistrates with reference to the late railway disaster. These proceedings have been instituted on the complaint of two of the public functionaries attacked by the "National." The Opposition papers make this prosecution the subject of severe animadversions on the policy and conduct of Government.

The Capital.—The Count de Las Cases, who accompanied Napoleon to St. Helena, died at Passy on Monday last.—A subscription has been opened in Paris for the sufferers by the fire at Hamburgh, at the head of which are some of the great commercial establishments, and the sum raised amounts to 61,000 f., or nearly 2,500*l.* The Bank of France has besides subscribed 15,000 f., or 600*l.* From the report of the committee on the bill providing for the support of the political refugees in France, lately presented to the Chamber of Deputies, it appears there are at present residing in Paris 16,672 political refugees, of whom 11,779 are Spaniards, 4,471 Poles, 410 Italians, and 12 from other countries.

The Fleet.—Accounts from Toulon announce the departure of the French squadron, under Admiral Hugon, on the 6th inst. A steamer and corvette were to join it in a few days. It was said that this naval division was to remain out a month or six weeks, and that it would successively visit Naples, Tunis, Algiers, and Mahon. There remained in Toulon four ships of the line, undergoing repairs; two others were in the Levant, another before Tangiers, and five at Brest. Another corvette of war was preparing to sail from Toulon to New Zealand. Private letters have since been received at Toulon which mention, that the squadron commanded by Admiral Hugon, which had been met under sail on the 12th inst. manœuvring at some distance from the islands of Hyeres, had returned to its moorings off those islands on the 13th inst.

SPAIN.—Our intelligence from Madrid is to the 9th inst. The reports of the modifications in the Cabinet and prorogation of the Cortes had entirely subsided. At the meeting of the Cortes on the 5th inst. one of the Deputies questioned the Ministry respecting the rumours in circulation as to the marriage of the Queen. He stated that these reports were offensive to Spanish honour, as the nation alone ought to interfere in any negotiations relative to that important event. He could not believe that any ally of Spain could have appointed persons to treat on this delicate subject; and if this were true, it was the duty of Government to demand the satisfaction which its honour required. Señor Gonzales, President of the Council, observed in reply, that too much circumspection could not be observed by Government in its explanations on this subject; but he would state quite enough to satisfy the Deputies that the dignity and decorum of the nation could never permit that any other country should meddle with negotiations which exclusively appertained to Spain, and that she must regard as an offence any pretended intervention in this matter. Government, he said, would not submit to the pretensions and demands of any other nation in this particular, but would consult solely the national dignity of Spain. This explanation appeared to give satisfaction to the Chamber, and the subject then dropped. The debates on the bill for the issuing of 160 millions of reals Treasury bills have been brought to a more speedy termination than was anticipated; and the bill has been voted by the Cortes without a division, although a number of amendments were proposed. Some questions were put to Ministers on the 6th inst. as to the proceedings at Barcelona. The Minister of the Interior assured the House that the advices received by Government were satisfactory; and our direct intelligence from Barcelona, of the 6th inst., confirms the Ministerial assertions. After five or six days of agitation, tranquillity had been restored, owing to the measures of precaution adopted by Gen. Van Halen and the political chief. The anniversary of the movement of the 4th May, 1837, had been celebrated with due honours by the population, and banners had been distributed to the newly-organised National Guards. Accounts received from Cadiz state that the principal merchants of that city, on being informed that in the new treaty of commerce about to be signed between Great Britain and Portugal, the import duties on Madeira and Port wines were to be considerably reduced, had held a meeting, and prepared a memorial to Government, in which they stated that it would be hereafter impossible for them to compete in the London market with the French and Portuguese wine-merchants. The Vine Committee of Puerto de Santa Maria had addressed a petition to the Cortes in favour of the introduction of English cottons [into Spain, on payment of a protecting duty of 20 or 25 per cent. The municipality of Xeres de la Frontera had forwarded an appeal to the same effect to the Regent: and the petitioners of both places describe the sad condition to which the south of Spain would be reduced, if, through any delay in concluding a treaty of commerce with Great Britain, Spanish wines were excluded from the English markets. Subsequent intelligence to the 10th inst. informs us that the Chamber of Deputies adopted on that day a resolution, that all transactions entered into by Government with regard to the issuing of the Treasury Bonds for 160,000,000 reals should be referred to the examination of a special committee. The House afterwards proceeded to discuss the estimates of the Foreign Department, and a warm debate arose upon a motion to reduce them by a sum of 2,200,000 reals, which lasted the whole evening. It was believed that the Cortes would be prorogued immediately after the vote of the budget.—Messrs. Onis and Alvear left Madrid on the 7th inst. for Holland, where they are to meet the two sons of the Infante Don Francisco de Paula. —Accounts had been received from Gibraltar, stating that the report of artillery in the direction of Tangiers having been heard at Tariffa on the 29th ult., the Governor of Gibraltar immediately despatched thither a war steamer to ascertain the cause of it. She returned the next day, and announced that a French brig, cruising before the harbour, was exercising her guns, and that all was tranquil at Tangiers. Two French men-of-war entered Gibraltar on the 30th ult.

Portugal.—We have news from Lisbon to the 9th inst. A commission of six members had been appointed by Government to consider the question of reductions in the tariff. It was believed that the difficulties in the way of signing the slave-trade treaty had been overcome, and that the latter would be signed, as well as the commercial treaty, in the course of the week, should the answer of the English Government to the proposition made ultimately to it have arrived in time. All the accounts received by the Home Minister from the provinces, with reference to the approaching elections are said to be favourable. It appears to have been at first apprehended that the tobacco contractors would give their great influence to the Opposition; but an amicable arrangement had taken place satisfactory to both parties; and four candidates in the interest of the tobacco contractors, unobjected to by Government, were expected to be returned to the Cortes. The new list of Peers, 30 in number, had been approved by the Queen in Council. The list seems to have been drawn up so as to include a fair representation of all parties. The most remarkable nominations were those of Count Bomfin, Count das Aretas, and Silva Carvalho. Some fresh failures for large amounts had occurred at Oporto, among which one house is mentioned, having 1,900 pipes of wine on hand. A powerful party had been formed for the restoration of the old Douro Wine Company, as the only efficient means for restoring prosperity to the wine-growers. It seems, however, to be regarded as the scheme of a few interested persons, which the Government was not expected to encourage. A decree had been issued, ordering that in future an English sovereign should pass in Madeira for 4,800 reis; an American eagle for 10 milreis, and the dollar for 1,000 reis. Baron Lagos's plan of conversion was understood as likely to be postponed till the Cortes meet, which is also the case of the intended law respecting the press.

Germany.—We have little intelligence of political interest, and the journals are almost exclusively occupied with comments on the recent disastrous conflagration at Hamburgh. General sympathy has been excited for the sufferers by this calamitous event; and great exertions are making at Vienna, Berlin, Frankfort, Augsburg, and, indeed, throughout Germany, to collect subscriptions for their relief. It is feared that many of the German insurance companies will be seriously compromised by the fire; and it is said that a company at Gotha will lose 10,000,000 florins. A similar calamity occurred, on the 3rd inst., in the Austrian town of Steijer, not far from Lintz, where 400 houses have been consumed; and three-fourths of the inhabitants, who were celebrated for their iron manufactures, have been left without shelter.—Accounts from Berlin inform us that the ex-King of Holland has entirely recovered from his recent illness. Private letters from Posen express serious fears for the consequences of the projected visit of the King of Prussia to St. Petersburgh. It seems there has existed a treaty between Prussia and Russia for the reciprocal surrender of deserters from those states respectively. The term of the treaty has expired, and a proposition for the renewal of it has been made to the Prussian Government on the part of the Emperor. It appears that there are at present in the Prussian states no less than 50,000 deserters or refugees from Russian Poland; and hopes are expressed that for the sake of the King's popularity and welfare, as well as on the score of humanity, his Majesty will not be induced to renew the treaty.

Hamburgh.—We have intelligence from this city to the 13th inst. The recent calamity is the sole topic of public conversation, and every post from the interior brings proofs of the deep sympathy felt throughout the States belonging to the Germanic Confederation, as well as from the other States of Europe, for the unfortunate sufferers by the fire. Letters of condolence have been addressed to the Senate by most of the Sovereigns and Sovereign Princes of the neighbouring States. Large donations have been made by most of them, as well as by the sister towns of Bremen and Lubeck; and it is stated that the Senate of Bremen have expressed their readiness to guarantee, to the extent of two millions of dollars, any loan which might be required for raising immediate funds for the reconstruction of the fallen portion of the city. The latest details of this calamitous event present nothing of interest which was not reported in our last. The fire was got under about two in the afternoon of Sunday the 8th inst.; it exhausted itself, terminating at the N. E. end of the town. About 2,000 houses are reported to have been burned or much injured; and the value of the property destroyed is estimated at 4,000,000*l.* sterling; the loss to the English insurance companies is said to be from 300,000*l.* to 500,000*l.* A number of dead bodies have already been dug out of the ruins; but the exact number of lives lost has not yet been ascertained. It is, however, reported that the killed, wounded, and missing amount altogether to about 200. The persons whose houses have been destroyed are at present occupying the churches, and the inhabitants are sending them provisions and clothing. The population of the city amounts to about 150,000 souls, and by this calamity nearly 30,000 persons are said to have been rendered houseless. Assistance in money, clothing, and provisions has arrived from the Kings of Prussia, Denmark, and Hanover. The Representative Chambers of Hanover have voted a grant, and the Senate of Frankfort have voted a sum of 100,000 florins (10,000*l.*) A meeting had been called by the English Consul, Col. Hodges, for the purpose of preparing an appeal to her Majesty and the British nation in favour of the unfortunate sufferers by the fire. The appeal was unanimously agreed to; and our readers will be pleased to learn that the appeal has been generously responded to on the part of the British public. Upwards of 10,000*l.* in dollars were sent over from London in the course of three days after the catastrophe was known, and the list of subscriptions continues to be increased with numerous donations. Her Majesty has given 200*l.*; the Queen Dowager, 150*l.*; Prince Albert, 100*l.*; and various munificent subscriptions have been contributed by the public companies, merchants, bankers, and private individuals of London. Reports appear to have been generally circulated, and to a great extent credited by the lower classes, that the fire was the work of incendiaries; and, as stated in our last, a hostile feeling had been excited towards the English residents in the town, against whom suspicions were entertained. Some serious outrages were in consequence committed by the mob, by which one Englishman lost his life and several were seriously injured. From a proclamation issued by the Senate, this occurrence appears to have been a source of great regret to the authorities. A positive contradiction has been given to the rumour, and the Senate speaks in terms of commendation of the excellent conduct of the English during the fire, who, it is stated, gave proofs of their utmost zeal in endeavouring to arrest the progress of the conflagration; and the Senate also announces that it is resolved to prosecute with all the rigour of the law all persons found guilty of offering any further outrage of a similar description. The exact position of the Hamburgh Insurance Companies is still unknown. It is hoped that three out of the four will be enabled to pay in full; but it is stated that the Government intends to indemnify them, by bearing the whole, or such portion as they cannot make good of the general loss, this indemnity, however, not extending to merchandise.

Switzerland.—Letters from Geneva, of the 13th inst., state that the sittings of the Constituent Assembly were becoming daily more stormy, and that the anarchists, headed by a Captain of the Swiss Guards in the service of Charles X., and a former member of the Parisian press, were preparing a revolutionary movement. The Liberal party of Zurich and Berne were said to have recommended the Genevese agitators to raise the standard before the opening of the Federal Diet, which was expected to take place in the beginning of summer.

Italy.—Letters from Naples of the 8th inst. state th the Court of Rome had accepted the proposition made to it by Holland and Belgium to act as mediator in some differences which have arisen between those countries and Naples, respecting the affair of the Tavoliere. The King of Naples, however, would not accept the mediation of the Pope, and fresh negotiations were shortly to be opened. The Duke de Montebello, the French Ambassador, had been called to Paris, and was to embark on the 11th. His journey was said to be connected with this affair, which, it is expected, will be arranged in Paris. The marriage of Princess Theresa with the Emperor of the Brazils was regarded as settled; and it was rumoured that another projected marriage was in contemplation between Prince Louis, brother of King Ferdinand, and Queen Isabella II. A post-office convention had been concluded between France and Naples. There was also some talk of a treaty of commerce between those countries. Many obstacles appeared in the way of its conclusion, but the relations existing between the two Governments appear to be on so friendly a footing, that some arrangement of the kind is regarded as probable. It was also said that England had made a similar proposition; that the Neapolitan Government has charged the Secretary of State, Prince Commitini, and two other commissioners, with the negotiation, and that the English Minister in Naples and Sir Woodbine Parish have been appointed commissioners for Great Britain.

Russia.—A ukase has been promulgated by the Emperor, dated the 2d of April, relative to the enfranchisement of serfs, which appears to have produced considerable excitement throughout the empire. In itself this ukase does not appear to ingraft any very important changes upon the existing law of enfranchisement, as it was already in the power of any noble to emancipate his serfs by a species of contract, subject to the approval of the Marshal of the province and of the Crown. The new ordinance does not enjoin this enfranchisement of serfs—it leaves it optional as it was before: but it defines the terms of the contract, and creates a species of copyhold tenure in favour of the peasant who receives his freedom on these conditions from his lord. The interference of the Crown between the lord and the serf is, however, greatly resented by the aristocracy. By this ukase the Government assumes a more direct influence over, and interest in, the gradual emancipation of the serf population. The measure was immediately followed by an official declaration, that it was not to be regarded as a change in the existing system; and that the most stringent precautions should be taken by the police to prevent all false interpretations of the ordinance from getting abroad. This declaration, however, was regarded as indicating the resentment it was calculated to occasion among the nobles, and the hopes it might awaken among the peasants; and private accounts state that the apprehensions which seem to have been entertained by the Government after the publication of the ukase have not been dispelled by the present aspect of affairs.—The number of journals and other periodicals now published in Russia is stated to be 139, being five more than in 1841; 98 are in the Russian language, 22 in German, 8 in French, 4 in English, 3 in Polish, 1 in Italian, and 3 in Latin.

Greece.—Intelligence has been received to the 28th ult. A dispute had arisen at Nauplia, between the staff of a regiment of artillery in garrison there, supported by part of the population, and the Bavarian Col. Hutz. This circumstance, though trifling in appearance, would, it was thought, occasion a modification of the Cabinet, the total expulsion of the Bavarians from the service, which was agitated in council, having produced an angry debate. Private letters from Athens, of the 28th ult., state that several violent shocks of an earthquake were felt in various parts of the Peloponnesus; on the 18th, at Sparta, the shocks lasted from 25 to 30 seconds each, and the inhabitants ran terrified out of their houses. On the same day, and in the course of the night, four or five other slighter shocks were experienced. Beyond the Eurotas a large rock fell from Mount Menelas, near the village of Drouchas: and an old tower situate in the town of Magoules was thrown to the ground. At Mistra the earth trembled with more violence than at Sparta, and a portion of the Hellenic College and several houses were destroyed. The water of the springs and wells became turbid, and a rock of large size, having detached itself from the summit of Mount Mistra, rolled into the town. At Calames, the first shock, felt at half past 9, lasted between 40 and 50 seconds, and there were ten others from that hour until midnight, at intervals of three-quarters of an hour. Most of the houses were damaged, and several in the neighbourhood thrown down. Upwards of 50 dwellings were thrown down at Areopolis, and 15 towers were destroyed at Œtylus. Many persons were buried under the ruins of their houses in the province of Maina, and at Androusa several churches fell in. On the 25th ult., about 4 a.m., another shock was felt at Patras, which lasted a minute and a half. The journals announce that a red rain had fallen at Tripolitza and elsewhere, and that the Minister of the Interior had collected information respecting the phenomenon, which would be submitted to the examination of the medical board.

Turkey and Syria.—By the arrival of the Levant mail we have received intelligence from Constantinople to the 27th ult. The Divan continued to be still almost exclusively occupied with the Syrian question. On the 17th ult., Selim Bey sailed for Beyrout, with instructions to inquire into the real state of affairs in the Lebanon, and to adopt, in concert with Mustapha Pacha, the measures best calculated to conciliate the interests of all parties. On the 23rd, a note was presented by the Russian Ambassador to the Reis Effendi, in which it is understood his Government remonstrated against the policy pursued by the Porte towards Syria, and especially against its refusal to recal Omar Pacha from the Lebanon. Private letters state that Omar Pacha's dismissal may now be confidently relied on, Sir S. Canning having at length obtained this concession from the Porte, after many difficulties. In respect to the passage of British troops over the Isthmus of Suez, it is now stated positively that, although no official application had been addressed to the Porte on the matter by Sir S. Canning, the subject has been mooted in Egypt, and that it is certain that this was the object of Sami Pacha's mission to Constantinople. The differences existing between Turkey and Greece do not appear to have been yet entirely settled. On the 25th ult. the Divan held a council, at which the preliminaries of a definitive arrangement were agreed upon, and the activity displayed by the Porte on this occasion induced a belief that the affair would be speedily and satisfactorily terminated. On the evening of the 25th ult. a quarrel arose between some British and Russian sailors, on the quay of Galata; during which several of the combatants were seriously wounded. A flotilla, composed of a corvette, two brigs, and two cutters, was preparing to put to sea on a cruise through the Archipelago and along the coasts, lately infested by pirates. According to the latest accounts from Jerusalem, the Anglican Bishop continued to be treated with great respect by the authorities, and with every appearance of support from his Greek and Catholic colleagues. The new residence or palace in process of erection is proceeding rapidly. The new church has also been commenced, subject to future risks, as no firman has been obtained for its construction. In the mean time the bishop performs divine service to a congregation varying from 25 to 30 persons, including his own family, in a chamber fitted up for the purpose in the consular residence.

EGYPT.—Our intelligence from Alexandria is to the 26th ult.; nothing of political importance has transpired since our last. The Pacha was still in the Delta, and nothing was positively known of his projected return to Alexandria. Private letters announce the arrival in Alexandria of several distinguished travellers in that city from Upper Egypt; amongst others, Count Pahlen and Capt. Basil Hall. Letters had been received from Suez, stating that a revolution had broken out amongst the Nedschès against Chaled Bey, who was compelled to fly into the province of Lachsa. The same letters state that 21,000 stand of arms had been landed at Alexandria by an English steamer, and that the boxes in which they were contained had been immediately forwarded to Suez. It is stated that the Russian merchants of Alexandria enjoy the privilege of exporting produce, on payment of a duty of 3 per cent., while all other merchants, English included, were compelled to pay 12 per cent.

UNITED STATES.—The Britannia steamer arrived at Liverpool on Monday night from Boston and Halifax. She sailed from Boston on the 15th inst., and arrived at Halifax on the 3rd, where she waited fifty-four hours for the Canada mails, but in consequence of the state of the weather they did not arrive, and she left without them on the 5th inst. She made the passage in ten days, and brings New York papers three days later than those received by the Great Western. The journals contain a long report by the Hon. Caleb Cushing, from the Committee of Foreign Affairs in the House of Representatives, on the commercial relations existing between the United States and the colonial possessions of Great Britain, in the West Indies and on the continent of America. The documents accompanying the report fill in all 218 pages, and the papers speak of it as one of the most valuable documents Congress has ordered to be published. After entering at great length into the system of prohibitions and restrictions adopted by Great Britain against the United States, and stating that it behoved the United States to protect their commerce and navigation by counter prohibitions, the report concludes with the following resolution, the adoption of which is recommended to Congress:—"That the President of the United States be, and hereby is, requested to enter into negotiations with the British Government, for the purpose of effecting a permanent, equitable, and just conventional arrangement of the commerce between the United States and the British colonies in America." The notices as to the important negotiations going on at Washington, between the Government and Lord Ashburton, are scanty; indeed, no precise information is given respecting them. The "New York American" of the 30th ult. says, in relation to this subject, "There is no intelligence from Washington by the mail this morning of interest to foreign readers. The temper of the public mind, however, it may be said unhesitatingly, is manifestly inclined to peace with England, and therefore the success of the special mission is confidently anticipated." Private accounts state, that several interviews had already taken place between Lord Ashburton and the authorities, and, it was believed, with the most satisfactory result: a private letter is said to have been received at the North and South American Coffee House, which stated that "Lord Ashburton has proposed to the Federal Government to settle the boundary question by paying for the land; that the proposition had been communicated to the Governments of Maine and Massachusetts; but that there was little chance of its success, as its fulfilment would involve an amendment of the federal constitution, in which at present no power exists to sell any part of the territory of the citizens or the rights of the states to a foreign power." Messrs. Biddle, Cowperthwaite, and Andrews, charged with a conspiracy to defraud, as officers of the bank of the United States, have been discharged from bail for all future appearance, there being no apparent cause for detention, Judge Doran, however, dissenting from the opinion delivered by the majority.

Parliament.

HOUSE OF LORDS.

Friday.—The House sat a short time, a portion of the business before it consisting in the presentation of a petition by Lord SYDNEY, from Lord J. Townsend, praying for a Committee of Privileges, to inquire into the circumstances attending the assumption of the title of Earl of Leicester by the member for Bodmin. The petition, on the motion of Lord BROUGHAM, was referred to a committee.

HOUSE OF COMMONS.

Friday.—Sir ROBERT PEEL, in reply to Lord Palmerston, said that the Commissioners who had been sent out by the late Government to investigate the disputed North American Boundary had made their report, and as soon as the annexes to that Report were completed, the whole would be laid upon the table of the House. A conversation took place respecting the disturbed state of Tipperary, when Lord ELIOT stated that the accounts were much exaggerated.—The Ordnance and Navy Estimates were agreed to.—After a conversation on the subject of Capt. Warner's "projectile," during which Sir R. PEEL stated that the negotiations of Government on the subject were suspended on account of the conditions required by Capt. Warner as to compensation, the Ecclesiastical Corporations Leasing Bill went through committee, on the understanding that the discussion should be taken on bringing up the Report.—Mr. ROEBUCK moved the first reading of Lord Brougham's Bill to prevent bribery and corruption by giving indemnity to witnesses, which, he said, would answer his present purpose. The bill was accordingly read a first time. Some other orders of the day were then disposed of, and the House adjourned.

CITY.

Money Market, Friday.—Notice was given that Government were about to reduce the interest on Exchequer-bills to 3 per Cent., or from 2$\frac{1}{4}$*d.* to 2*d.* per day. Consols for money and the account were finally quoted 92$\frac{3}{8}$ to $\frac{1}{2}$; Three per Cents. Reduced, 91$\frac{3}{8}$ to $\frac{1}{2}$; Three-and-a-half per Cents. Reduced, 99$\frac{3}{4}$ to $\frac{7}{8}$; New Three-and-a-half per Cents., 100$\frac{5}{8}$ to $\frac{7}{8}$; Bank Stock, 167 to 168; India Stock, 249 to 250; and Exchequer-bills, 34s. to 36s. premium.

Metropolis and its Vicinity.

Her Majesty's Birthday.—Thursday being the day appointed for the celebration of the Queen's birthday, the usual rejoicings and festivities were observed throughout the Metropolis. In the course of the morning an inspection of the household troops took place on the parade in St. James's Park, in the presence of Prince Albert, who appeared as Colonel of the 1st reg. of Grenadier Guards; the Duke of Cambridge, as the Col. of the Coldstream Guards; Prince George of Cambridge, as Lieut.-Col. of the 8th Dragoon Guards; and Lord Hill, with a numerous staff. The troops, who wore their new clothing, and looked well, went through their various evolutions in a soldierlike manner, and to the satisfaction of the distinguished officers present. The Life Guards formed on the right of the infantry; and after the inspection was over, the bands of the three regiments marched down to the St. James's Palace quadrangle, where they performed the National Anthem and several other pieces. The Drawing-room held by the Queen at St. James's Palace in celebration of the event was numerously attended; and the approaches to the Palace were crowded with persons anxious to view the distinguished visitors who attended it. State banquets were given by all the members of Government in honour of the event; and the *fête* given by the Duke of Wellington is said to have been, with the exception of her Majesty's fancy dress ball, the most splendid entertainment of the season. The visitors exceeded 800 persons of rank and fashion. In the course of the day, in accordance with the usual custom, the mails proceeded in procession to the Post-office, the guards and drivers, as well as the postmen, wearing their new liveries. In the evening the Club-houses and public establishments at the West End were illuminated.

Metropolitan Improvements.—For some days past a number of workmen have been employed in boats on the lake in St. James's Park, in the construction of a fountain. It is on the lake near the gate opposite Buckingham Palace, and will, no doubt, be an ornament to the Park.—On Wednesday the portion of the new street which is to connect Farringdon-street with Islington, and is completed as far as West-street, was thrown open to foot passengers.

Whitsuntide Amusements.—The different places of public amusement in the Metropolis and its vicinity have, as usual at this season of general holiday, been numerously attended during the week. The national exhibitions, the Tower, British Museum, National Gallery, Zoological Gardens, Theatres, and similar places of entertainment, have been crowded with visitors. In consequence of the fineness of the weather, the fairs in the neighbourhood of town appear to have proved the principal sources of attraction. On Monday Greenwich is said to have received a greater influx of visitors than has been seen for many years. The fair, the park and the heath, the railway, steamers, and coaches, appear to have been alike crowded. Nearly forty steamers were engaged all day, and many of them, it is said, carried as many as 800 passengers each. Some accounts state that no less than 500,000 persons passed down the river during the day; and on the Greenwich Railway it is said that upwards of 100,000 persons went up and down the line in the first and second class carriages. Everything, however, appears to have passed off satisfactorily; and no accidents of a serious nature or disturbances of any kind have taken place. The British Museum has also kept up its interest during the holidays; the number of visitors on Whit Monday being 16,329; on Tuesday, 3,290; and on Wednesday, 3,955. The total number of visitors exceeded those of last Whitsun holidays by nearly 7,000. Notwithstanding the large concourse of persons on Monday, there was no case of damage or disturbance; nor was any one refused admission on the ground of disorderly conduct.

Public Meetings.—The annual meeting of the British and Foreign Anti-slavery Society has been held at Exeter Hall, the Marquis of Clanricarde in the chair. The chairman commenced the proceedings by stating that it was unnecessary for him to detain the meeting by explaining the objects for which they had assembled, or the feelings which made those objects dear to them. Those objects were such as must be dear to every friend to the human race, and to every Christian, no matter what might be his political bias. The secretary then read the report, from which it appeared that, notwithstanding all the exertions made for the suppression of the slave-trade, it had diminished very little. As the slave-seller's profits were now greater than formerly, his incentives to pursue the traffic had been multiplied. The repeated violation of the treaties entered into with the various Christian powers of Europe and America, for the suppression of the slave-trade, was then noticed, and an opinion expressed that it was only by the universal abolition of slavery that the trade could be effectually put down. After alluding, in terms of reprehension, to the continuance of slavery in our East Indian dominions, it was announced, as a gratifying fact, that the Bey of Tunis had not only emancipated his own slaves, but prohibited the slave-trade throughout his territories, and was endeavouring to induce his subjects to follow his example. The various schemes of immigration into the British West India colonies were then alluded to, and condemned as resulting merely in a large expenditure of money and a great waste of human life. The report then went on to express the gratitude of the society to the Emperor of Russia for his recent ukase abolishing serfdom throughout his dominions, and having announced the confidence of the society in the success of their objects, concluded by stating that another anti-slavery convention would be held in London on the 13th June, 1843. After some further observations from Dr. Lushington, the Bishop of Norwich, Lord Clifford, and Mr. Buckingham, the report was adopted unanimously.—On Monday, the fifth anniversary of the Aborigines Protection Society was held at Exeter Hall, and was numerously attended, a great number of the persons present being members of the Society of Friends. The Secretary read the report, which stated that the objects of the society were the improvement and protection of the aborigines connected with British colonies and commerce. The aborigines entitled to the term British amounted to one million inhabiting Australia, one million in the South Seas, including Zealand, half a million still surviving in North and South America, and two millions in Western and Southern Africa, with several millions of the more barbarous tribes in British India and its borders, and in the Eastern archipelago and the Indian ocean. Of foreign aborigines benefited by the society there were sixteen millions in America, sixty millions in Africa, two hundred millions in Asia, and a small but interesting remnant of ancient European barbarism existing in Lapland. The report further stated that by extensive correspondence at home and abroad, by the publication of documents and papers, by communications with the different departments of the State, by presentation of petitions to the Crown and Legislature, and by medical relief, the society endeavoured to raise the moral and physical condition of those people. It then went into a voluminous detail of the several negotiations that had taken place between the society, Lord J. Russell, and Lord Stanley respecting those objects, and concluded with a strong appeal in favour of the funds of the society, which were represented as being in an exhausted state. Several gentlemen addressed the meeting, and the report was adopted.—On Tuesday the annual general meeting of the Home Missionary Society was held at Exeter Hall. The report stated, that never before was there a stronger claim for scriptural knowledge than at the present time; and the committee had the satisfaction of stating, that the missionaries they had employed during the past year had met with success. At no former period had they occupied so many stations, employed so many Christian instructors, or, on the whole, been of such effectual service. The last report mentioned 142 principal stations as under the care of the Society, with 153 out-stations. That number had, during the year, been extended to 635. It was also the object of the society to employ agents to assist the missionaries in their labours in addition to their ordinary duties. The whole number of missionaries at present engaged was 145, in addition to 11 students preparing for the performance of similar offices—being an increase of 13 upon the previous year. The number of chapels and rooms occupied had increased from 567 to 620; the parishes over which their operations extended, from 417 to 438; the hearers, from 40,000 to 49,500; the Sunday schools, from 173 to 204; and the teachers, from 1,260 to 1,475. The receipts amounted to 7,169*l.* 15s. 8d., and the expenditure to 9,390*l.* 15s. 7d. After a few speeches, the report was adopted.

Spitalfields.—We have already noticed in a previous Number that a ball will be given on the 26th inst., at her Majesty's Theatre, for the benefit of the distressed weavers of this district of the Metropolis, and that it was probable that her Majesty and Prince Albert would honour it with their presence. It is now announced positively that the Queen has signified her intention of being present on the occasion, and that Prince Albert, with the other members of the Royal Family, will also attend. It is also stated that the Queen has expressed her wish that all ladies attending this ball should appear in dresses of Spitalfields manufacture; and that the patterns approved of by her Majesty have been selected with a view to employ the greatest possible number of weavers. This announcement appears to have created general interest, which has been enhanced by the report that the Queen and Prince Albert will attend on this occasion in the splendid costumes of the late fancy ball given by her Majesty at Buckingham Palace, which example is expected to be followed by the greater portion of the company.

Mortality of the Metropolis.—The following is the number of deaths that have occurred in the Metropolis, from all causes registered, during the week ending Saturthe 7th inst:—Males, 378; Females, 378; total, 756. Weekly average 1838-9-40-1—Males, 467; Females, 445: total, 912.

Strawberry Hill.—The sale of effects at this place closes to-day: it has been numerously attended throughout the week, and uniformly high prices have been obtained for every article. The effects sold this week appear to have been particularly interesting, and some of the most important among the miscellaneous collection. They have comprised the valuables in the Round Tower, the Refectory, the Entrance, and the Armoury, together with the effects of the China-room, and a large collection of paintings, drawings, models, &c. Some of the rarer lots realised high prices. The celebrated silver inkstand of Horace Walpole fetched 36s. an ounce; it weighs about 90 oz., and is understood to have been purchased by Sir R. Peel. The clock, once the property of Anne Boleyn, is stated to have been purchased for her present Majesty for 110*l.* The celebrated suit of armour of Francis I., a beautiful piece of workmanship, and supposed to be the finest suit in England, was purchased for 320 guineas. The horn representing the history of St. Hubert, the patron of foresters, enamelled in Limoges china, was sold for 141*l.* These lots were among the best in the whole collection. The hat stated to have belonged to Cardinal Wolsey was sold for 20 guineas, and is said to have been bought by Mr. C. Kean, of the Haymarket Theatre. The Oriental china cistern on a Gothic carved pedestal, which, though possessing no great intrinsic excellence, either for beauty of design or manufacture, excited considerable interest as the vase in which Horace Walpole's cat was drowned, an event celebrated in the well-known ode of Gray, was bought for Lord Derby for 40 guineas. The ebony chairs, the Abbot of Glastonbury's chair, the India quilts, and sundry other curiosities, formed the principal objects of attraction, and realised high prices. The sale on the premises will terminate this day; but it is announced that a fortnight's sale of prints and drawings will take place in London. The gross proceeds of the effects already amount to upwards of 25,000*l*; and it is thought that when concluded the whole property will have realised upwards of 30,000*l.*

Greenwich.—A vestry meeting of the inhabitants of this town has been held for the purpose of making a church-rate, and for other parochial business. The vicar, the Rev. W. A. Soames, took the chair. The vestry clerk read the estimate, made by the churchwardens, on which the call for a church-rate was grounded, from which it appeared that the amount required for salaries, &c., was 327*l.*, and the amount calculated to be expended on the repair of the edifice 430*l.*, making a total of 757*l.* A twopenny rate would produce 590*l.*, which with burial fees 10*l.*, herbage rents 21*l.*, and money arising from charities 10*l.*, would leave a balance of 25*l.* against the parish. A rate of twopence in the pound was then proposed and seconded; after which a Mr. Bass rose and spoke at great length against the rate, animadverting on the injustice of church-rates generally, and expressing a hope that they would be banished from this town for ever, as he said they already had been from Leeds, Manchester, Birmingham, and other large towns. He concluded by moving as an amendment that a church-rate was unnecessary, and that it be not granted. Several other persons then addressed the meeting, after which the question was put, when there appeared for the rate, 64; against it, 111; majority, 47. The chairman consequently declared the rate lost. A poll has since been demanded, which lasted two days, and at its close the numbers were, for the rate 528, against it 207; giving a majority of 321 in favour of the rate.

Woolwich.—We gave a brief account in a former Number of a new composition for caulking and strengthening ships, invented by Mr. Jeffrey. Lieut.-Gen. Lord Bloomfield having expressed his desire to hear some details of the nature of the materials employed, Mr. Jeffrey has since given the following explanations on the subject. He commenced his details by exhibiting before Lord Bloomfield, and a number of officers of the Royal Artillery, pieces of copper covered with the composition, to show that it was equally applicable to the preservation of metals from the effects of salt-water as it was to wood. When mixed with certain materials, it prevented the adhesion of barnacles or other shell-fish, so injurious to wood or to copper when not properly prepared. A block was next exhibited, fixed together, composed of three pieces, having on one side of the centre-piece about three-quarters of an inch of the composition, and on the other side a similar thickness of the substance at present generally used. This block had been submitted to a pressure of 22 tons, to show the effect that would be produced in very cold climates. The new composition under that pressure retained its softness, but the present caulking materials became as brittle as rosin, and were broken into powder by a slight blow, which had no effect upon the new composition. The two pieces of teak referred to in our former notice of this subject, as having been joined together and tested with a strain of 21 tons by the hydraulic machine in the dock-yard, were then exhibited, showing that iron bolts of 1½ inch in diameter had been snapped in two without producing any effect on the composition; and another block, formed of three pieces joined together, so as to present angles which would give great force against the joinings in whatever position it might fall to the ground, was exhibited to show that it had received no injury, although it had been thrown from the top of the shears in the dockyard, 76 feet high, on the hard granite below. To show the quickness with which the new composition could be made available, Mr. Jeffrey joined two pieces of wood with it, and another piece he broke and fixed again in its rough state, and in about 15 minutes he submitted them for the purpose of being broken, which could only be effected by breaking with a hammer the solid wood on each side. Mr. Jeffrey concluded his details by expressing the obligations he felt under to the Lords of the Admiralty and the officers of this dockyard, without whose assistance he said he should not have been able to carry out his invention to its present satisfactory extent.

Provincial News.

Aylesbury.—On Wednesday this town was the scene of much excitement in consequence of its being the day fixed for the presentation of "the Chandos Testimonial" to the Duke of Buckingham, given by the gentlemen and farmers of Buckinghamshire to his Grace for his uniform support and devotion to the cause of the agricultural interest. The Earl of Orkney presided, and about 600 gentlemen, comprising many of the nobility and members of the House of Commons, were present. After the customary toasts had been given, the chairman rose and said, that it was with great satisfaction he found himself deputed by the farmers of Buckinghamshire, and other friends attached to agriculture, to present to his Grace the piece of plate which was then before him. He hoped his Grace would approve of it, but it was, he assured him, far below their estimate of what his past services deserved. The Hon. Secretary, Mr. A. Tyndall, then read the address accompanying the testimonial, and which expressed in strong terms the gratitude felt by the subscribers for his Grace's services, and their admiration of his firmness of principle and rectitude of conduct. The Duke of Buckingham in reply said, that he was unequal to the task of expressing extemporaneously all he felt; but, entertaining an anxious desire to put on record his feelings towards this county, and to the friends who surrounded him, he would read an address in reply, which, when he was gone, he trusted would recal to their recollection the sentiments which he entertained towards them. Our space will not admit of our giving even the heads of his Grace's address. It expressed his grateful sentiments for the honour done him, and his satisfaction at their approval of his Parliamentary career. "Viewing," he said, "the progress of events in Parliament, and the struggle of a portion of his countrymen to obtain extensive changes solely because they were changes, he could not consent to forego the rights and customs which the wisdom of their ancestors had established and their experience confirmed, for the hazard of imagined improvement, or for the purpose of obtaining temporary popularity. On each proposition for sweeping changes in the working of the constitution he had reviewed his opinions carefully, and he adhered to them the more strongly when he found they stood the test of reflection and principle, and, he might now add, of time and experience. He believed that the strength of the nation is based upon the soil, from which, like its favourite emblem, the British Oak, its energy and duration are equally derived; and holding these sentiments, he should indeed have felt himself involved in a dereliction of duty had he not exerted himself to the utmost in order to obtain for the cultivators of their native land rights of representation equivalent to those claimed for and conceded to householders." Several other toasts were proposed, among which were, the Members for the county and borough, and the Marquis of Chandos; the latter of whom, in returning thanks, addressed the meeting at some length, and said that he could not describe to them the feelings with which he had heard the address read; and if ever he should come forward as an advocate of their cause in the political world, he would endeavour always to tread in the steps of his father, and to support those measures which had earned for him such a reward.

Brighton.—A few days since, at the Magistrates' Court in this town, the clerk presented to Major Allen, the magistrate on the bench, about 40 distress warrants for signature against various parties who had refused to pay church rates. Major Allen refused to sign them, and alleged as a reason that Mr. N. Wigney was one of the magistrates who adjudicated in the various cases, and the law required that the two magistrates who decided in favour of issuing the warrants must sign them. Mr. Wigney, by his bankruptcy, is disqualified as a magistrate, and the consequence it appears is, that the parties who resisted the payment of the rate cannot again be brought before the bench.—The mackerel fishery commenced off this port on the 13th inst., and some of the boats have been successful in taking some fine fish, the principal part of which were bought for the London market, and forwarded by the railway. Off Eastbourne the fishermen have been successful, and the fish are said to have generally fetched high prices.

Bristol.—A local paper informs us that during the high winds on the 8th inst. the harbour and floating docks of this city were visited by large flights of the Sterna Arctica, or Arctic Tern. The birds were assembled in such numbers, that two or three hundred were killed with stones and other missiles, whilst several were caught alive, and many were observed to pitch on the backs of passers-by. The Tern is a native of the higher arctic regions, and has been met with in all the late expeditions to the Polar Seas. It is a summer visitant to the coasts of Scotland and the north of England, but is rarely met with more southerly, and, until the present, there appears to be no instance on record of a specimen having been obtained in this neighbourhood. Flocks of these birds were also observed the same day at Clevedon, Weston, and other places along the Channel coast.

Cambridge.—Considerable interest continues to be felt on the subject of the approaching installation of the Duke of Northumberland at this University; and, as stated in our last, it appears to be a general impression that a very large number of visitors, including Prince Albert and many distinguished individuals, will honour this city with their company on the occasion. The preparations for the ball in the Fitzwilliam Museum have already been begun, and in addition to the other arrangements, steps have been taken for holding an horticultural exhibition on the 7th July. The musical performances will take place as follows: July 2, a concert; July 4, an oratorio; on the 5th the performance of the Installation ode; on the following evening a concert; and on the morning of the 7th, an oratorio, "The Messiah." The oratorios will be held in Great St. Mary's church, and the concerts in the Senate-house. The band and chorus, it is said, will consist of upwards of 140 performers, and it is understood that the most eminent vocalists will be engaged.

Carnarvon.—It has been announced that Lord Dinorben has issued the necessary instructions for the rebuilding of the mansion at Kinmel-park, which, as noticed in a former Number, was some time since partly destroyed by fire. Workmen are already employed in clearing the ground preparatory to the commencement of the work, which will be proceeded with immediately.

Chelmsford.—The following case, which is remarkable as showing an extraordinary degree of credulity on the part of the plaintiff, was tried at the Quarter Sessions, in this town, on Tuesday. Louisa Dalton, a Gipsy, was charged with having obtained from Hannah Guiver, several sums of money by false pretences. The counsel for the prosecution in opening the case, told the jury that the circumstances were such as they would hardly believe, if they were not clearly proved by the evidence. The principal witness, Hannah Guiver, was a young woman who had been in an ill state of health, which arose, he believed, from unrequited love. Prisoner, who travelled the country, got access to her, and induced her to believe that she was spell-bound, and proposed, on the payment of a certain sum of money, to perform certain magical ceremonies, by means of which she would be relieved from that spell. The learned gentleman than detailed the facts of the case as stated in the evidence. Hannah Guiver was then examined at length and detailed the whole system of imposition practised on her, which occasioned much amusement in the court from the extraordinary degree of credulity which she appeared to have manifested. On behalf of the prisoner it was urged that this was a case in which the party had no right to complain of the consequence of her own folly. If people chose to go and buy advice, such as it might be, they could have no right to turn round in this manner on the person of whom they had bought it. The jury, without hesitation, found her guilty. The Chairman, in passing sentence, observed, that the law must protect the weak in mind as well as the weak in body, or it would be no law at all; and he sentenced the prisoner to 10 years' transportation.

Devizes.—The local papers contain a lengthened account of the proceedings at a public meeting of farmers which has been held in this town on the subject of the proposed tariff of Government. The importation of foreign cattle and agricultural produce were the clauses in the proposed measure chiefly objected to. A number of gentlemen addressed the meeting, but the speech which excited most attention was one by Mr. Walter Long, Member for North Wilts. He endeavoured to show that the tariff would not produce all the results which the farmers apprehended; but he allowed that cheese and meat would be much lower in price. He observed, moreover, that the fall in price would not be immediate. He said, he had travelled a great deal, and he knew that in France and in Belgium they did not now raise more meat than they required for their own consumption; but when he considered that in Belgium, where the land was cultivated in the highest perfection, where they had achieved that which Mr. Arthur Young had said entitled a man to the thanks of his country, namely, to make one acre produce more than two acres had previously produced—when he knew that there they could grow barley, and mangel-wurzel, and turnips to greater perfection, and at a much less cost than the English farmer could, and that they could, with their cheap produce, fatten cattle of all kinds and send them over here almost free of duty, he did fear, that in a few years, when they had made all their preparations, they would be able to export such quantities of stock as would seriously affect our markets, and be a grievous injury to our farmers and graziers. He then proceeded to say, that he was not pledged to Sir R. Peel to support those clauses of the tariff which would be injurious to their interest; he had, therefore, as an independent member of the House of Commons, united with 70 others to oppose those alterations that related to live stock. He should be very sorry to do anything to embarrass the present Government, for he believed it accorded with the feelings of all whom he was addressing; but if the Government would not consult the county members on matters so important to their constituents, they were justified in trying to force the Government to attend to their wants. A petition against the proposed importation of live stock and agricultural produce was ultimately adopted unanimously.

Dover.—During the last fortnight three fires have broken out in various parts of the Blean woods, in this county, destroying property to a considerable amount. They are supposed to be the act of an incendiary. Some portion of the property destroyed belongs to the Archbishop of Canterbury, and between 30 and 40 acres of it to the Dering family. Nearly 50 acres of underwood have been burnt; and it is thought that much more would have been destroyed, but for the interposition of the neighbours.

Dudley.—This town and the neighbouring districts, which were recently the scene of serious disturbances, are now again restored to a state of partial tranquillity. The nailors have for the most part resumed their work at a reduction of 10 per cent.; but great numbers are yet standing out, particularly in Rowley Regis, Cradley, Lye Waste, and their vicinities. Many of the workmen are wandering about the various roads and neighbouring towns, asking alms, in numbers varying from two to six or more together, but without any disposition to riot. As the monthly engagement of the colliers expired a few days since, a turn-out was contemplated; but the precautionary measures taken by the authorities have hitherto prevented such a step on their part. Several men have been committed for being concerned in the late disturbances. Some troops of Yeomanry are still out on duty.

Hitchin.—Some sensation has been occasioned in this town by the sudden death of J. M. Pierson, Esq., banker. The firm has, for the present, suspended their payments; but it is thought that at the meeting of the creditors, announced to be held in a few days, a satisfactory statement will be made of the affairs of the establishment.

Liverpool.—A serious fire, attended with loss of life, occurred on Saturday in the village of Bootle, near this city. It broke out in the middle of the night at the Bootle Coffee-house, and spread so rapidly, that the inmates with difficulty made their escape, and one young boy perished in the flames. It was a considerable time before the fire was got under, and not until several engines from this city had arrived on the spot. The loss is stated to be considerable. The fire appears to have originated from the explosion of one of the gas-pipes.

Newcastle.—A few days since, a large mass of rock, calculated to weigh no less than 300 tons, fell down into the river Wear, on its south side, some distance above the bridge. Fortunately no injurious effects resulted to life or property, as no vessels of any kind were near the place at the time.

Oxford.—By the provisions of the Theological Statute passed last week, Dr. Hampden, Regius Professor of Divinity, has been constituted chairman of the new theological board, and is also recognised as a public University Professor in Dogmatic Theology. This statute virtually rescinds the judgment passed by the University on the Professor's theological opinions, in 1836, on occasion of his appointment to the Chair by her Majesty, at the recommendation of the late administration.

Plymouth.—It is currently reported in this town that it is the intention of the Queen and Prince Albert to visit the government establishments at this port some time during the summer; and it is thought probable that the visit will take place in July, at which time the Albion, 90, now building, will be ready for launching.

Preston.—Some excitement has been produced in this town by a murder committed under peculiar circumstances of atrocity, followed by an attempt at suicide on the part of the murderer. It seems that a cotton-spinner, of the name of Whittle, residing in Vicar-street, after partaking of his dinner, went up to his wife, and, on the pretence of kissing her, cut her throat with a razor, which he had concealed in his hand, and so effectually that she expired in a few minutes. He then attempted to destroy himself, but did not succeed, and was immediately taken into custody. There appears to be no motive for the commission of the crime; and deceased is stated to have always lived on terms of affection with her husband. An inquest has been held, and a verdict of "Wilful murder" returned against the prisoner; but he continues in a dangerous state from the effects of his wounds, and his recovery is doubtful.

Southampton.—On Monday a number of persons visited this town from London, to join in a pleasure excursion round the Isle of Wight, returning to the Metropolis the same evening. A few similar trips took place last season, noticed by us at the time; and it is understood that the excursion on Monday was but the first of a series, which it is intended shall take place this season, for the purpose of affording the inhabitants of the Metropolis an opportunity of seeing, in the limited space of one day, some of the finest scenery along the southern coast of England. The party, consisting of a great number of persons, left London by a special train at 7 in the morning, and arrived about 10 in this town, where a steamer had been prepared for their reception, and in which they started immediately on a tour round the Isle of Wight. The whole distance, which is said to be upwards of 90 miles, was performed in about 6 hours; and, after remaining a short time in this town, the party again returned by special train to London, where they arrived about 10, the whole distance thus performed during the day, by land and water, amounting to about 270 miles.

Tonbridge.—On Monday evening the inhabitants of this place were alarmed by the report of a loud explosion, which proved to be at the powder manufactory belonging to Messrs. Barton, a short distance from the town. On inquiry, it was ascertained that it arose in consequence of some green charge igniting. The building in which it occurred was blown to pieces; but fortunately no injury appears to have been sustained by any of the workmen.

Windsor.—The extensive repairs and embellishments determined upon some months since by the Dean and Canons have just been commenced at the great western window of St. George's Chapel, and the workmen, it is said, are under orders to have the whole completed with all possible despatch, so that they may be finished in the course of the ensuing summer. It seems that this window, which for some years past has been considered in a dangerous state, in consequence of the stone-work bulging inwards to the extent, in many parts, of several inches, underwent a survey by the late Sir J. Wyatville, a few years before his death; and in consequence of his report it was determined that it should undergo the necessary repairs immediately. In consequence, however, of the architect's other engagements, these repairs were deferred, and have been delayed up to the present time. The whole of the painted glass has now been removed, preparatory to the new construction of the stone-work of the window, under the superintendence of Mr. Blore, the architect. The arrangement of the stained glass has been confided to Mr. Willement. It appears this window has not been repaired for upwards of 70 years. About that time it was restored to a state of great perfection by the Dean and Canons, under the superintendence of Dr. Lockman, one of the Canons, who collected all the remains of the ancient painted glass dispersed through the different parts of the chapel, and had them placed in appropriate positions in the west window. Mr. Willement, it is said, has received instructions to have the devices and figures newly arranged, to the exclusion of the modern glass it contained, which is to be replaced by new of a superior character, to harmonise with the ancient portions of the window. It is estimated that the repairs of this window alone will cause an outlay of between 2,000*l.* and 3,000*l.*—It is stated that extensive improvements and alterations are about to be carried into effect at Eton College at the estimated expense of nearly 30,000*l.*, which will comprise commodious apartments for sleeping and for study, and also for those meals which the pupils do not now take in the hall of the college. An estimate of the expense to be incurred in carrying the intended plans into effect has been furnished to the college, and subscriptions, amounting to upwards of 10,000*l.*, have already been received.—A plantation called the "Clock-case," belonging to her Majesty, at Virginia Water, was recently discovered to have been fired at an early hour in the morning, and before any assistance could be effectually procured, a considerable portion was consumed, and the remainder much injured. There being reasons to suspect that the plantation had been wilfully fired, the Commissioners of her Majesty's Woods and Forests have offered a reward of 20 guineas to any one who will give such information as may lead to the discovery of the parties guilty of the offence.

York.—It is stated that upwards of 40,000*l.* have been subscribed for the purpose of erecting a new Roman Catholic Cathedral in this city, and that the ground and buildings have been already purchased. They extend from the Holy Trinity Church to the Bar, where a monastery formerly stood. Mr. Pugin has been selected as the architect, and the works are to be commenced immediately.

Railways.—The following are the returns of the principal railways during the past week:—Brighton line, 2,835*l.*; Blackwall, 887*l.*; Edinburgh and Glasgow, 2,126*l.*; Midland Counties, 2,650*l.*; Great North of England, 1,324*l.*; North Midland, 4,059*l.*; South-Western, 6,557*l.*; Birmingham and Derby, 1,193*l.*; Great Western, 13,749*l.*; Northern and Eastern, 1,184*l.*; Manchester and Leeds, 4,302*l.*; London and Birmingham, 17,111*l.*; Greenwich, 763; Birmingham and Gloucester, 1,662*l.*; Hull and Selby, 861*l.*; Eastern Counties, 940*l.* The following has been published as an estimate of the cost attending the mere construction of the London and Brighton railway:—It is calculated that 6,000,000 cubic yards of earth-work, at 8*d.* per yard, cost 200,000*l.*; about 100 bridges, drains, &c., 100,000*l.*; 2 viaducts, 40,000*l.*; 3 miles of tunnelling, 120,000*l.*; 50 miles of permanent way, at 4,000*l.* per mile, 200,000*l.*; 500 acres of land, 100,000*l.*; and stations, engine-houses, &c., 30,000*l.*; making in all 790,000*l.*, which, with an addition of 50,000*l.* for contingencies consequent upon any default of work, &c., would make a sum total of 840,000*l.*—The new station of the Manchester and Birmingham Railway in the London-road, Manchester, was opened a few days since at the same time as that part of the line newly constructed, extending from Stockport to Sandbach. The trains on the new line excited great interest at the various villages through which they passed, and crowds of persons assembled at the stations to witness the novel scene of their arrival and departure.—A serious accident has occurred on the works of the Eastern Counties Railway, at Kelvedon, by the fall of a large bridge, which was near completion, occasioning the loss of one life, and injuring six other persons. The bridge, which was situated on the north side of the high road, at the east end of Kelvedon, consisted of three arches, the first being thrown over the road leading to Coggeshall, the second over the river, and the third joined up to the embankment at the Colchester end. The centre of the first arch was struck last week, and the road under it had been thrown open to the public. The clearing of the timbers from the other arches was completed on Monday, and a number of bricklayers were employed in carrying up the parapets, when the whole works suddenly fell in with a loud crash, and fifteen or sixteen bricklayers, who were upon the scaffolding, were thrown in all directions, some of them falling into the river; but, fortunately, they all appear to have escaped with only a few bruises, excepting one man who was killed on the spot and another seriously injured. The accident is said to have been caused by the wet state of the weather at the time the work was put together.—It is announced that the public opening of the South-Eastern Railway to Tunbridge is fixed for the 26th inst.—A special general meeting of proprietors of the London and Croydon Railway has been held, to take into consideration the copy of a Bill now before Parliament, to enable the Company to make an approach to their railway from the Grange Road, Bermondsey. It appeared that the object of the measure, which was promoted also by the South-Eastern Company, was to afford better accommodation for the merchandize and cattle conveyed along the Croydon, Dover, and Brighton Railways, from the adjoining counties of Surrey, Kent, and Sussex, and also to provide for the convenience of the public residing at the western parts of the Metropolis, as the London-Bridge terminus was not adapted to the accommodation of the whole traffic of the different lines. The intention is to form a roadway from the Grange Road, near the Green Man, Old Kent Road, to the Croydon Railway, near Corbett's-lane, the length of which is about one mile, interfering only with one or two buildings of an inferior description. The Chairman, Mr. Wilkinson, went into a detailed account of the benefits of the proposal, and said he considered it one of the most judicious plans ever laid before the proprietors. At the request of a proprietor, the various clauses of the proposed Bill were read by the solicitor, who said that no other clauses had been submitted, except one or two by the Commissioners of Sewers, and that the Croydon and South-Eastern Companies were perfectly agreed on the subject, and would bear the expense jointly. The Chairman proposed that this meeting do approve of the said Bill, and that it become law under such alterations as may seem meet to Parliament; which was seconded by Mr. Paterson. Mr. Levy deprecated the proposed measure as a useless expense, and said that if his arguments did not convince that meeting that such was the fact, he hoped his petition to the Houses of Lords and Commons would do so, as he was prepared to show that the distance to Grosvenor-square and the West End generally was not so great over London Bridge as by the proposed route. The Chairman replied to the various objections of Mr. Levy. Mr. Pare hoped Mr. Levy would withdraw his amendment, but that gentleman persevered, and his amendment adjourning the subject till the next annual meeting being put was lost by a great majority, whilst the original motion was afterwards carried unanimously.

IRELAND.

Dublin.—The Chamberlain has issued an official notice that their Excellencies' state ball, in commemoration of her Majesty's birthday, will take place on the 31st inst. It is expected that this entertainment will be of a superior description. In compliance with a requisition from the Lord Mayor, a numerous meeting was held on Monday, to consider the effect of the proposed tariff on Irish interests; and also the best mode of forwarding Irish manufacture and the repeal of the Union. The Lord Mayor took the chair. Several operatives and tradesmen addressed the meeting on the decay of various branches of trade in this city, since the Legislative Union, and called upon the meeting to pledge themselves to use nothing but Irish manufactures. A variety of resolutions were proposed, stating that there were thousands of industrious operatives in a state of great destitution in this city; that trade generally was in a serious state of decay over the entire kingdom, and that this condition of things required the best attention of the Legislature. Resolutions were also passed in condemnation of the new tariff. The proceedings of the meeting concluded by a long address from Mr. O'Connell. He commented on the several clauses of the new tariff, which, he said, though he was on principle a free-trade man, he must condemn as a left-handed measure, intended chiefly to provide for the luxuries of the rich, and one that would prove a delusion to the poor. He then proceeded to speak on the subject of repeal: he said the time had come when he could announce distinctly to the people of Ireland that they had the power to carry repeal if they were but guided by him. Let them not fear, he would lead no man into strife, battle, or violence, or riot, or outrage—he would belong to no movement that would disturb the social circle, or be tarnished by one drop of human blood; but he would assist in that mighty movement which, having the good wishes of all men in society, would, he trusted, have the blessing of Almighty God. He enlarged at some length on the present condition of England, more particularly on what he considered the threatening nature of her foreign relations, and thought that the present state of her affairs would materially assist them in effecting the repeal of the Union. He concluded by saying that he wanted three millions of enrolled repealers, and let him have that number once, he would sacrifice his existence if they had not the repeal of the Union three months afterwards.—The following is an abstract of a return recently made to the House of Commons, of the quantities of grain and malt imported into Great Britain from Ireland in each year, from 1800 to 1841, both inclusive, divided into septennial periods:—In the first seven years the total quantity imported was 1,899,323 quarters; in the second period it was 4,688,057 quarters; in the third, 6,791,305 quarters; in the fourth, 11,773,872 quarters; in the fifth, 18,299,403 quarters; and in the sixth, 19,568,635 quarters. It thus appears that the importations of grain and malt from Ireland have sustained a large progressive increase during each of the above septennial periods. The large increase which took place in the 5th period appears to be accounted for by the operation of the new Corn Bill, which was passed in 1828. According to another return to the House of Commons, of the amounts received and paid by the Woods and Forests Department in Ireland, for each of the last nine years, it appears that the total amount received, from the year 1834 (inclusive) to 1842, was 628,549*l.* 10*s.* 11*d.*; and that the total sum expended amounted to 128,549*l.* 10*s.*

Tipperary.—A meeting of magistrates, convened by the high sheriff of this county, has been held at Nenagh, for the purpose of taking into consideration the disturbed state of this county, and to suggest to Government such remedies as would be advisable to adopt for the protection of life and property, and the suppression of crime. The meeting was well attended, there being 27 magistrates and four stipendiaries present. Resolutions were passed and forwarded to Government; the publication of which, however, is for the present withheld. The local papers continue to publish lists of fresh outrages, and state that crime in the North Riding, particularly in the neighbouring baronies, is still as rife as ever. In the southern districts of the county a severe conflict took place a few nights since, near Michelstown, between three policemen and a roving party of ten men, with whom they came in collision. The policemen endeavoured to arrest some of the party; but an attack was made upon them, and two were beaten so severely that little hope is entertained of their recovery. The third policeman escaped, and, in the confusion, took off one of the men's guns instead of his own, which it is thought may be the means of detecting the party. The body of one of them was found about a mile distant from where the conflict took place, his death having been caused by a bayonet wound inflicted by the police.

Belfast.—The local papers inform us that, notwithstanding the advance of the season, emigration is still proceeding with as much vigour as in the commencement of the spring; and that it is upon as extensive a scale in Ulster as in the southern counties. From this port alone, since the opening of the present season, 13 vessels have sailed for Quebec, St. John's, and Prince Edward's Island, carrying out about 3,500 passengers. Some vessels have also sailed for the United States, with three or four hundred passengers.

SCOTLAND.

Edinburgh.— A serious accident, fortunately not attended with fatal consequences, occurred a few days since at the terminus of the Edinburgh and Glasgow Railway. It appears that the goods train, consisting of 17 heavily-laden trucks, having arrived from this city at the Cowlairs station, Glasgow, was, contrary to the orders of the directors, placed upon the incline with only one "break" attached; and the momentum of the train overpowering the means of resistance in the hands of the "breaksman," the trucks ran down the declivity with great velocity. Fortunately nothing was in the way, and the train was stopped at the terminus by the overturning of two or three waggons in a pit. The waggons were broken to pieces; but, on the whole, the damage sustained was not great, and, with the exception of the "breaksman," who was a good deal bruised, no one was injured.

Glasgow.—At the late sitting of the Circuit Court of Justiciary in this city, Daniel Peddie, sorter of newspapers in the Post-office, was accused, on six charges, of stealing or wilfully delaying, in course of conveyance, printed newspapers without covers, or in covers open at the sides. The prisoner pleaded guilty to two of the charges, and was sentenced to six months' imprisonment. It appeared that the papers so abstracted were principally those directed to foreign parts, upon which the postage had not been paid, and which the prisoner ought to have transmitted to the "Dead Letter Office." A local paper states, that the monthly meteorological table for Greenock shows that no rain fell in that town during the whole of last month; and adds that Greenock and this city bear about an equal reputation for being the Dreepdallies of the west of Scotland. —It appears that, from some cause at present unknown, a serious fire has occurred in the woods of Ardgowan, by which nearly 100 acres of fine young planting have been destroyed.

Kilmarnock.—Considerable destitution has for some time past prevailed among the labouring poor of this town, in consequence of the depressed state of trade, and the general want of work. A committee appointed for the relief of the distressed poor went round the different wards of the town a few days since in order to ascertain accurately the amount of real destitution existing, when, after a strict scrutiny, the number of unemployed, including dependents, was found to amount to 1,105. The committee continues to hold meetings daily, with the view of giving immediate employment where it ought to be given, and the applications are very numerous. Collections have been made in all the churches for this purpose, and a considerable sum of money has already been raised.

Dundee.— The recently-depressed state of trade in this manufacturing district has been somewhat relieved by the receipt of the contract for supplying the navy with canvass this year. With the exception of a small portion, which will be executed in Kirkaldy, the entire contract has been given to manufacturers in this town. The value of the work is estimated at between 50,000*l.* and 60,000*l.* —A petition was lately sent from this town to the Lords of the Treasury, numerously signed, praying that they would grant a sum for the benefit of the unemployed operatives of this place. The result has been that their Lordships have granted 300*l.*, which, it is understood, will be principally, if not wholly, employed in finishing the improvements lately begun on the Magdalene-yard Green.

Inverness.—A few days since the Rev. Mr. Fraser, of New York, well known as the claimant of the estate and title of Lovat, was waylaid on his road from Inches House to this town, when he was knocked down and beaten severely by two young men at present unknown. He was discovered some time after lying insensible between two dykes, and conveyed to his lodgings, where medical aid was obtained; but according to the last accounts he was in a very dangerous state.

Paisley.—It has been announced that the entire sum of the contributions raised at home and abroad for the relief of the poor of this town and neighbourhood, the distressed state of which has been referred to in former Numbers of this Paper, amount to nearly 25,000*l.*

THEATRICALS.

Drury Lane.—The different theatres of the Metropolis, as usual in the Whitsun week, have proved an attraction to a great number of visitors. At this theatre "Macbeth" and "Hamlet," with the opera of "Acis and Galatea," and the play of "The Stranger," with the opera of "Sonnambula," were produced. In the latter the part of *Amina* was sustained with considerable success by Miss Romer. One or two favourite afterpieces have also been performed, and the entertainments have given satisfaction to crowded houses. The performances at this theatre close for the season this evening.

Covent Garden.—Mozart's well-known opera "Die Zauberflöte" was produced by the German Company at this theatre on Monday; Madame Heinefetter performing the part of *Pamina*, Madame Schodel that of *Die Königin der Nacht*, and Mlle. Wettlaufer that of *Papagena.* The male characters were *Sarastro*, Herr Staudigl; *Papageno*, Herr Mellenger; and *Tamino*, Herr Abresch. The different performers sustained their parts effectively; the choruses were executed with precision and correctness, and altogether the opera was well represented. The house was full, and the audience appeared to be much gratified with the entertainment.

English Opera House.—The chief feature in the performances at this theatre this week has been the revival of a little piece called the "Picturesque and Beautiful," which has not been played for several years. The introduction of a *tableau vivant* representing the picture of Mary Queen of Scots constituted the chief attraction in the burletta, and appeared to give general satisfaction.

Haymarket. — There has been no novelty at this theatre this week. The holiday pieces were, the "Lady of Lyons," which has been acting for some time past with considerable success, and in which Mr. and Mrs. Kean sustain the paincipal characters; and two afterpieces, "A Lover by Proxy," and "The Pretty Girls of Stilberg."

Surrey. — The Whitsuntide entertainments at this theatre have been a new equestrian military drama, in four acts, entitled "Murat the Peasant, General, Prince, and King." The career of this soldier of fortune is well adapted for melodramatic display, and the spectacle, which is of an imposing description, represents in its progress the rise and fall of Murat, and the principal events in which he was engaged in France, Italy, Egypt, Naples, and Russia. There is an exhibition of several striking incidents, and a succession of effective scenes. Mr. H. Hughes as *Murat*, Mr. Hicks as his friend in life and companion in death, and Mrs. H. Vining as a peasant girl attached to him and following him in his fortunes, performed their respective parts in a manner that elicited much applause. The other entertainments consisted of scenes in the circle, and a comic drama, in two acts, called "The Sprig of Mobility," all of which were well received by a crowded audience.

Miscellaneous.

New Poor Law.—The following are the main characteristics of the new bill which is now in the House of Commons, and which was brought in by Sir J. Graham last week. The Poor-law Commission is to be continued for five years. This continuance Sir J. Graham, stated, is proposed by Government from a perfect conviction of the utility of the Commission, as derived from the experience of its working, and the necessity of the Commission, to the effectual working out the law. Sir J. Graham added that the primary object of the Commission is not, as erroneously supposed, to provide for the indiscriminate and inflexible administration of the law, but to ensure the safe and efficient working of the law, by providing for diversity in its administration where circumstances are different, and securing uniformity where circumstances are similar. The number of assistant commissioners is to be limited to nine, in consequence of the work for them being now less laborious and less exigent than at first. Next comes the abolition, expressly and entirely, of the Gilbert Unions. These unions are few in number; they are in scattered localities: they interfere with the harmonious working of the Poor-law; and their principle is opposed to the characterising principle of the Poor-law Amendment Act. In the Gilbert Unions, it is incumbent to provide all able-bodied applicants with relief; while in the Poor-law Amendment Act Unions it is the aged, the sick, and the destitute, who are to be provided for. Under the Poor-law Amendment Act there is no rigid prohibition of out-door relief. The rule under which relief is administered furnishes no less than seven exceptions, by which boards of guardians, without any reference to the commissioners, can give out-door relief. From the forthcoming annual report of the Poor-law Commission, it appears that during the last year upwards of a million of individuals received relief, of whom only 159,000 were relieved in workhouses. In addition to the great characteristics of the bill, the continuance of the Poor-law Commission, and the abolition of the Gilbert Unions, there are some amendments to be introduced into the law. Union district schools for pauper children are to be limited to a circle of fifteen miles each, and these schools are to be under the superintendence of the Educational Committee of the Privy Council. Casual poor are to be chargeable on the respective unions, and not on the individual parishes where they may happen to have been relieved. In the case of natural children, the father of a chargeable child may be imprisoned for three months, if he has no goods to be taken in execution. The law of settlement is to be modified, by which sick poor may be relieved in parishes where they may happen to be resident. Parish apprentices are to have protective regulations, and local acts are not to be interfered with. Such are the main features of the new bill, which Sir J. Graham declared was calculated, in his sincere conviction and belief, to provide for the poor and needy, and to produce great advantage to the community at large.

New South Wales.—Two returns of some interest, as relating to this colony, have recently been published by the House of Commons. The first shows that of 118,592 emigrants from the United Kingdom during the past year, no fewer than 27,386 departed for that colony. Of this number 22,752 were enabled to emigrate by means of bounties payable in New South Wales, and 4,634 defrayed their passage from other sources. From the second return it appears that of 56 millions of pounds weight of sheep and lambs' wool imported into the United Kingdom in 1841, eight millions of pounds was the produce of New South Wales. The aggregate quantity imported into this country from the whole of the Australian settlements was 12,399,090 lbs. With a population calculated at about 200,000, these colonies appear to have received British woollen manufactured goods valued at 91,851*l.*; and by the account of exports, whence this statement is taken, the entire amount of similar exports from the United Kingdom, to all parts of the world, did not exceed a declared value of 5,748,673*l.*

Bank Returns.—The official returns of the average general circulation of the kingdom, for the four weeks ending the 2d ult., compared with that for the 5th March, present a decrease of 587,248*l.* The decrease is thus apportioned:—The Bank of England, 220,000*l.*; the difference between 16,674,000*l.* and 16,894,000*l.* Private Banks in England, 10,405*l.*; the difference between 5,289,050*l.* and 5,299,455*l.* The Private and Joint-stock Banks in Scotland, 140,819*l.*; the difference between 2,670,290*l.* and 2,811,109*l.* The Bank of Ireland, 114,625*l.*; the difference between 3,074,125*l.* and 3,188,750*l.* The Private and Joint-stock Banks of that kingdom, 148,069*l.*; the difference between 2,259,556*l.* and 2,407,625*l.*; forming a total of 633,918*l.*; from which has to be deducted an increase of 46,670*l.* in the circulation of the English Joint-stock Banks, the difference between 3,047,656*l.* and 2,990,986*l.* The bullion in the Bank of England continues steadily to increase, being now 725,000*l.* more than the former return; the stock at present being 7,006,000*l.* against 6,281,000*l.*

Vessels of the United Kingdom.—A return has been laid before Parliament of the number of vessels, above fifty tons burthen, and the total amount of their tonnage registered, at each of the ports of Great Britain and Ireland, including the Channel Islands. The three chief ports in England are London, Liverpool, and Newcastle; in Scotland, Glasgow, including Greenock and Port Glasgow, Aberdeen and Dundee; in Ireland, Belfast, Cork, and Dublin. The returns for these places are as follows:—London, 2,405 vessels, 598,554 tons; Liverpool, 1,097 v., 307,852 t.; Newcastle, 1,143 v., 259,571 t.; Glasgow, 662 v., 187,545 t.; Aberdeen, 298 v., 52,443 t.; Dundee, 282 v., 50,060 t.; Belfast, 250 v., 44,458 t.; Cork, 221 v., 29,765 t.; Dublin, 134 v., 23,072 t. Total for England, 10,804 v., 2,033,345 t.; Scotland, 2,261 v., 429,635 t.; Ireland, 1,037 v., 165,969 t.; and for the whole of the United Kingdom, including the Channel Islands, 14,416 v., and 2,668,732 t.

Law.

Court of Queen's Bench.—*Challand* v. *Braye.*—The plaintiff in this case had made a match with a third party to trot two horses, for 25*l.* a side, upon a part of the turnpike road between Huddersfield and Woodhead. Each party deposited 15*l.* with the defendant as a stakeholder, but the plaintiff refused to run his horse, and brought this action to recover back his deposit. The case having come on for trial before the Under-Sheriff for Yorkshire, a verdict was returned for the plaintiff—damages, 15*l.* Leave was, however, given to the defendant's counsel to move this Court for liberty to enter a nonsuit, upon the ground, that as the wager was a legal one, the deposit had in the circumstances been forfeited, and that the plaintiff was therefore not entitled to recover. Upon a former occasion the rule had been obtained, and cause was subsequently shown against it upon the ground—first; that the race being for only 25*l.*, was for a lesser sum than was allowed by the law, which rendered illegal all races for sums less than 50*l.* It was also contended in the same place, that a race upon a common turnpike-road was illegal even at the common law, in consequence of the danger which might result to the public in passing along that way in the exercise of their lawful avocations. With regard to the first point, his Lordship referred to a case which had occurred in the Court of Common Pleas, in which it had been decided that a race for 25*l.* a side was to be considered as a race for 50*l.* Upon the second point Mr. Justice Coleridge admitted that, in all cases, a race upon a turnpike-road would be highly inconvenient, and, in the majority of instances, be actually illegal. He could not, however, assume that it was impossible to select such a time, and take such precautions and make such arrangements upon the subject as to make such a race perfectly safe and legal. As the race in the present case was not actually run, the Court could not presume that if it had taken place it would have been attended with such a want of precaution as to lead to any injury or inconvenience to the public, and especially as the match was not a galloping but a trotting match, in which the speed of the animals engaged would of course be much less than in the former case. The question, therefore, must finally be decided upon the consideration of the Act which allows, with certain limitations, races of every kind to be run in any place whatever throughout England. In construing these latter expressions, Lord Eldon had been of opinion that they were not to be limited to those places where it had been usual to run races before, but that it extended to all places over England where the running of a race would not be otherwise illegal or exceptionable. He (Mr. Justice Coleridge) adopted this construction, and was therefore of opinion that the wager was not illegal, that the deposit was forfeited, that the plaintiff was not therefore entitled to recover, and that the rule must be therefore absolute.

Secondaries Court.—On Tuesday an action was brought in this Court by a Mr. White, a law-stationer, against Mr. C. A. Pike, a solicitor, to recover the sum of 3*l.* 7*s.* 6*d.*, for copying sundry documents. Amongst the items there were some for "expedition," the plaintiff's clerks having to work through the Sunday, and 3*s.* 6*d.* for attending the Court of Chancery with the copies. The defence was, first, that the plaintiff had a partner; and secondly, that work done on a Sunday could not be charged for. The Secondary said, that whether the work was done on a Sunday or not was not material; it was sent to be done with expedition. The other charges were fair, and he should leave the Jury to say whether any and what part of the sum ought to be recovered. The Jury immediately found for the amount claimed.

INSOLVENT DEBTORS' COURT.—*In re John Edward Carew, the sculptor.*—This is a case of a peculiar character, and has excited a good deal of public attention. The Chief Commissioner, in giving judgment, prefaced his remarks by the following general sketch of the history and proceedings in the case. Mr. Carew was pursuing a successful career as a sculptor in London, when he came in contact with the late Earl of Egremont, a munificent patron of the arts, at whose suggestion, and with the understanding that an annuity was to be fixed upon him, he removed to Brighton in 1839, and subsequently to Grove-house, near Petworth, in the vicinity of the Earl's residence, and was engaged on various works for his lordship during the whole of that period, up to within a few days of his decease, when an occurrence of a very peculiar nature was alleged to have taken place, the Earl having put a roll of paper into Mr. Carew's hands, saying, "Take that, it will show the world how I estimate your talents," and upon leaving the spot, coming back immediately, and, before Mr. Carew had had time to examine the paper, and asking for its return, as he wished to make some alteration. It was given back as requested. A few days afterwards Lord Egremont adds a codicil to his will, and declaring that he had done everything for everybody that he intended, and then laid him down and died. His executors then met, his will and papers of every description were examined with the greatest attention, but no mention whatever is made in any of them of Mr. Carew. As there could have been no disposition on the part of the executors to injure Mr. Carew, and as no such paper was discovered, the fact itself became a matter of very grave consideration and doubt. After Lord Egremont's death, Mr. Carew explained his altered situation from the withdrawal of his lordship's patronage, and the disappointment of his expectations, to one of his executors, General Wyndham, by whom he was desired to furnish them with some sort of an account, to justify them in advancing him any money from the estate; which being done, he was requested to furnish another, and be more specific as to dates; which being done, he subjoins a statement that he was induced to leave Sir Richard Westmacott's by the representation of Lord Egremont, and that for 17 years of his life he had been employed by him, and for the seven years previous to his death entirely devoted to him. That last statement showed how greatly that gentleman had been mistaken; for in his own balance sheet, and by his own showing, it was false. That account being also objected to, another was drawn up, but still no date, making the astounding sum of 30,000*l.* due to him, for works performed for Lord Egremont, and an annuity for 14 years, making the balance due to him 50,000*l.* The executors, finding all the accounts different and irreconcileable with each other, determined to have the matter settled by a legal tribunal, and a bill of particulars was sent in, constituting the fourth demand; but before the trial, a bill was filed in Chancery by the executors, calling on Mr. Carew to say whether he had received certain sums therein specified. The trial then came on, but Mr. Thesiger, his counsel, finding a difficulty to prove certain items, was compelled to consent to a nonsuit. The insolvent was then sent to prison on a debt of 80*l.*, and, wishing to take the benefit of the Insolvent Act, inserts the executors of the Earl of Egremont in his schedule as creditors for an annuity of 1,700*l.* a year, and demands 19,000*l.* against the estate. The executors, when they saw that, entered an opposition, and after a patient hearing, it was for the court now to say what could be proved against the estate. It was admitted at the trial that he had proved for works to the amount of 17,547*l.* Then the question arose as to whether he had any legal demand against the estate for four items, the statue of William IV., the altar-piece at Brighton, the erection of the monument in Chichester Cathedral, and the statue of Mr. Huskisson. With respect to the first claim, there appeared to be no foundation from beginning to end. He could not convert a hope or expectation into a debt. The next claim, namely, for the statue of William IV., he would dismiss in a word. It stood without any sort of confirmation. The next and most material of all was the Roman Catholic altar-piece at Brighton, and certainly with respect to that the statement was most extraordinary. One day Lord Egremont said to Mr. Carew that he had received a letter from the Roman Catholic priest to contribute to the building of the Roman Catholic chapel at Brighton, and observed that he never would give him anything, but he would tell him what he would do if he (Mr. Carew) would erect an altar-piece; he (Lord Egremont) would present it to him. Some conversation then took place as to the subject, and the Crucifixion was proposed, but his lordship, not liking that, ultimately fixed on the Baptism of our Saviour by John. The work was executed, and it was one of considerable power, and, he hoped, would be instrumental to Mr. Carew's future success. Lord Egremont subsequently publicly denied that he was in any way, as was rumoured, responsible for the work with great indignation. The insolvent knew that, but never, it appeared, thought of remonstrating. When the story in all its bearings was considered, it appeared to be some unaccountable delusion or fancy engendered in the mind of Mr. Carew. With respect to the statue of Mr. Huskisson, the evidence was not so conclusive against the insolvent as the former, and he was content that he should charge the estate with that so far as the difference of expense went betwixt the execution of a tabular monument and a statue, it appearing that the change had been made by his lordship's order, although individually he did not consider himself liable. That would add to his admitted claim 1,660*l.*, making the entire claim that could by any possibility be made against the estate 19,207*l.* 18*s.* 10*d.* Having said what was his claim against the estate, it then remained to say how much it could be proved Lord Egremont had paid him. In his answer to the bill in Chancery he had admitted the receipt of 13,721*l.* 9*s.* 5*d.* He was then charged by the executors with the receipt of ten checks, and after a careful investigation, he was of opinion that all these were substantiated; and without entering into detail, it was sufficient to say generally that they were proved by subsequent admissions on the part of the insolvent, by the accounts at Mastermans', the bankers, and by the manner in which the insolvent answered when questioned as to some of them, that there was no evidence that he had received them. If those ten drafts be added, then the whole sum proved as having been received by Mr. Carew was 21,331*l.* 9*s.* 5*d.* above his own claim, and defeating any demand he had against the executors. As to his insolvency arising from his disappointment as to his annuity, he had been supplied, during the year previous to Lord Egremont's death, with between 5,000*l.* and 6,000*l.*, notwithstanding which he was in a state of difficulty and deeply involved. He was not, therefore, justified in attributing his insolvency to that cause. In all the letters that had been put in there was no evidence of the promise of an annuity, nor even the most distant allusion to it; and the statement respecting the paper alleged to have been put into the insolvent's hand by Lord Egremont was, to say the least of it, improbable. He hoped that there was a great deal in the evidence of Mr. Carew that arose from forgetfulness, from agitation, from false impressions, and constantly indulging hopes existing only in his own ardent mind. The executors had acted in this matter with a proper regard to the memory of the deceased nobleman, and with as much regard to the insolvent as could be expected, and he hoped it would not be dared to be insinuated that they had destroyed the paper referred to by Mr. Carew. When the alteration was made in the schedule, as he had indicated, there was no reason why that gentleman should remain longer in custody, and he hoped that he would go forth into the world again, and find his due reward in the exercise of that talent of which he was undoubtedly possessed. After a few remarks from Mr. Commissioner Bowen, who said that the truth of the schedule appeared to him to be that the executors ought to be credited for 21,331*l.* 19*s.* 5*d.*, and that they are to be debited with 17,547*l.* 18*s.* 5*d.*, and for Huskisson's statue 1,660*l.*, making together 19,207*l.* 18*s.* 5*d.*, that alteration having been made in the schedule, the insolvent was then declared to be entitled to the benefit of the act, and ordered to be discharged forthwith.

SPORTING.

TATTERSALL'S (THURSDAY).—The subscribers met, for the first time, in the new room, the opening of which has taken place ten days sooner than was anticipated. It is expected to prove in every respect an acceptable accommodation to the frequenters of "the corner." It is capacious, lofty, well lighted and ventilated, and is fitted up with every attention to the comfort of the members. Its convenience as a summer resort for speculators is increased by a couple of doors, opening over a raised stone terrace to the circle, from which all but subscribers will be excluded on public days. "Comparing" formed an essential preliminary to the business transacted in the course of the afternoon; considerable progress was made, but much yet remains to be done. The Derby betting was confined to a few horses, and did not lead to many changes of importance. Against Coldrenick 5 to 2 was laid frequently, without bettering his position; in fact, 11 to 4 was offered at the close in two or three quarters. Attila was backed to a considerable amount at 7 to 2, also without advancing, as the same odds might have been obtained at the finish. Auckland and Canadian had strong parties, the former rising to 7 to 1, and the latter to 8 to 1, both taken with spirit; if we add that the Agreeable colt was supported at 1000 to 60, 18, and finally at 20 to 1, we shall have mentioned all the *rising* favourites. The seceders were Jack (14, 15, and in one place 20 to 1, laid), Lasso, Meteor, and the Lord of Holderness; the last three were friendless. The betting against outsiders does not encourage an expectation that either of them will make any great figure in future quotations. Mr. Bird, the nominator of Dr. Allen, is reported to be dead; should this be true, all bets against the horse are void, except those in which he may have been coupled with others. The Oaks: The Adela filly, Dil-bar, Firebrand, Ma Mie, and Meal, were in force at the prices given below; and 17 to 1 would have been taken about Dark Susan. Offers to lay 11 to 1 agst the Yorkshire Lass filly. The betting, although far from brisk, was continued till seven o'clock, and terminated with the following averages:—

DERBY.

20 to 1 agst	Forth's lot	50 to 1 agst	Moss Trooper
11 4	Coldrenick	80 1	Cheops

GAZETTE OF THE WEEK.

INSOLVENTS.—S. Quested, 77, Harrow-road, Paddington, corn-dealer—J. Mills, Manor-street, Clapham, Surrey, ship-owner—C. D. Bowers, Cannon-street, City, comb-maker.

BANKRUPTS.—G. Greenwell, J. B. D. Dearberg, and W. Whitehall, Fore-street, London, and Coventry, silk-manufacturers—T. Chapman, jun., Chenies-street, Tottenham Court road, and Great George-street, Euston-square, dairyman—J. Barratt, Great Pulteney-street, Golden-square, builder—J. Wood and J. Howard, Leeds and Belfast, merchants—E. and T. Tomkies, Shrewsbury and Manchester, fellmongers—W. Gilroy, Birmingham, ironmonger—J. Pollock, Liverpool, merchant—C. Pratten, Bristol, shoemaker—B. Wrigley, Horest, Yorkshire, woollen cloth manufacturer—T. Renny and W. Brown, Liverpool, oil-cloth-manufacturers—D. Hadingham, Cambridge, linen-draper—J. Deckray, and T. Pinder, Leeds, machine-makers—J. Simmons, late of Wellingborough, Northamptonshire, but now of Atherstone, Warwickshire, furnishing-ironmonger—H. C. M. Dyer, Manchester, and New Broad-street, London, merchant—E. Wilby, Ossett, Yorkshire, cloth-manufacturer—W. Wilks, Bengewirth, Worcestershire, coal-merchant—J. Smalley, Duxberry Mill, Lancashire, corn-miller—T. Brettell, Rupert-street, Haymarket, printer—W. Smith, Curtain-road, merchant—A. Duncan, Cowper's-court, Cornhill, merchant—J. Smith, Huddersfield, wine merchant—J. Irvine, Liverpool, salt-broker—M. New, Great Malvern, Worcestershire, innkeeper—J. Stewart, Hampton-street, Walworth, linen-draper—W. Hooper, Reading, tobacco-manufacturer—J. Rowley, sen., Willenhall, Staffordshire, curry-comb-maker—W. Thorpe, Goole, Yorkshire, stone-mason.

SCOTCH SEQUESTRATION.—C. Kennedy, Edinburgh, late of Fisher-row, surgeon.

BIRTHS.—On the 14th inst., in Gloucester-place, Portman-square, the lady of T. S. Clarke, Esq., barrister-at-law, of a daughter—On the 11th instant, at Nosely Hall, Leicestershire, the lady of Sir Arthur G. Haylerigg, Bart., of a daughter—On the 15th inst., at Upper Tulse Hill, Mrs. George, of a daughter—On the 13th inst., at Norwood, the lady of Bazett D. Colvin, Esq., of a son—On the 14th inst., at South-row, Blackheath, Mrs. T. Parker, of a son—On the 13th inst., at Grove-hill, Camberwell grove, Mrs. W. K. Jameson, of a son—On the 16th inst., at Wellington-terrace, St. John's-wood, the wife of Mr. George Meaden, of a son.

MARRIED.—On the 17th inst., at Hove, near Brighton, Harry D. Goring, Esq., of Highden, Sussex, eldest son of Sir C. F. Goring, Bart., to Mary Elizabeth, eldest daughter and heiress of the late J. G. Lewis, Esq., of Llanddyfnan, Anglesea, and relict of J. Panton, jun., Esq., of Plasgwyn, in the same county.—On the 17th inst., at St. George's Church, Hanover square, Lieut.-Gen. Sir J. Harbart, to Charlotte, eldest daughter of the late Sir Nelson Rycroft, Bart.—On the 14th inst., at Brixton, Mr. H. Parry, of Deptford, solicitor, to Louisa Emily, 3rd daughter of the late S. Leckett, Esq., of Clapham.

DIED.—On the 18th inst., in Lower Brook-street, [illegible] P. Vans Agnew; he served with distinction for a long period in India, and was for many years a Director of the East India Company.—On the [illegible] inst., at Hampstead, in his 79th year, R. Salisbury, Esq.—On the 12th inst., at St. Peter's, near Ramsgate, W. Blackburn, Esq., aged 69—On the 14th inst., at Hackney, Robert Cooper, Esq., late Accountant General of Excise, aged 59—On the 16th inst., at Southfleet, Kent, Jane Charlotte, wife of the Rev. G. F. Ottey, and daughter of the late B. Monro, Esq.—On the 3rd inst., at Lisbon, in his [illegible] year, Major Gen. Sir Ralph Ousley, K.B.C. de A.K.C., T.S., K.C.F.—On the 4th instant, at Matlock, Bath, Lucy Jane, daughter of H. Smith, Esq., of Wilford House, Nottinghamshire, aged 12 years—On the 12th inst., at Hotfield, Hertfordshire, aged 44, the Rev. Benjamin Peile, for 20 years curate of that parish—At Downton Hall, near Ludlow, after a short illness, the lady of Sir W. E. Rouse Boughton, Bart.

On the 30th inst., to be continued Monthly, price Half-a-Crown, a New Part of

THE PICTORIAL HISTORY of FRANCE. By GEORGE MOIR BUSSEY; with numerous Illustrations, by JULES DAVID.

*** Parts 1 to 4, price 2*s.* 6*d.* each, including all the Numbers published by Mr. Dorrington, may now be had, with a certainty that the work will be carried on to a conclusion.

London: Wm. S. Orr and Co., Amen-corner, Paternoster-row.

This day is published, in 8vo, price 21*s.*, a few on large paper (royal 8vo) for colouring, price 2*l.* 2*s.*

HERALDRY OF FISH.—By THOMAS MOULE.

Nearly 600 Families are noticed in this work; and besides the several descriptions of Fish, Fishing-nets, and Boats, are included also Mermaids, Tritons, and Shell-fish. Nearly 70 Ancient Seals are described, and upwards of 20 subjects in Stained Glass. The Engravings, 205 in number, are from Stained Glass, Tombs, Sculpture, and Carving; Medals and Coins; Rolls of Arms, and Pedigrees.—John Van Voorst, 1, Paternoster-row.

IMPORTANT WORKS ON BOTANY AND GARDENING, published by Ridgway, Piccadilly; and to be had, by order, of every country Bookseller.

1.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols., beautifully coloured, price 25*s.* each.

2.

DR. LINDLEY'S BOTANICAL REGISTER. Published monthly, price 3*s.* 6*d.* each Number, containing Drawings from Nature of the newest and most beautiful Plants, with Directions for Cultivation, &c. &c. The volume for 1841 is now ready, price 2*l.* 2*s.*

"The Botanical Register, from containing most or all the new Plants introduced by the Horticultural Society, from the great care with which its plates are executed, and the judicious remarks on culture and general habit, by Dr. Lindley, is, in consequence, the superior publication."—*Loudon's Magazine of Botany, &c.*

"Too much praise cannot be bestowed upon this work."—*Horticultural Cabinet.*

3.

DR. LINDLEY'S SERTUM ORCHIDACEUM. A Wreath of the most beautiful Orchidaceous Flowers, in Ten Parts, price 25*s.* each. This splendid work is now complete, the Tenth Part being just published.

4.

DR. LINDLEY'S BOTANICAL HISTORY OF ROSES, with Coloured Plates, price 21*s.*

5.

DR. LINDLEY'S ACCOUNT OF THE BOTANY OF SWAN RIVER, with Coloured Plates, price 10*s.* 6*d.*

6.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS. Illustrated by Drawings on Stone, from the Sketches of Francis Bauer, Esq., F.L.S., &c. Complete in Four Parts, beautifully Coloured, price 30*s.* each.

7.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS, in 8vo, in Seven Parts, is now complete; and Subscribers are respectfully requested to make up their sets as soon as possible, several of the early Numbers being nearly out of print.

8.

DON'S EDITION OF SWEET'S CATALOGUE OF PLANTS, corrected to the present time, without Supplements. Price 21*s.* cloth boards, arranged.

"It certainly is the most complete and useful Catalogue that has yet appeared, as, in one line, it gives the systematic and English names, where described, of what country it is a native, the year introduced, the months when in flower, whether hardy or tender, its duration, and reference to the books in which it is figured; and where any names have been lately changed, a synonym is given in Italics, to show what it is changed from. It also contains nearly double the number of Plants contained in any other Catalogue that we have seen; so that, on the whole, we believe it could not have been more complete. In our opinion, the arrangement according to the natural system is far preferable to that of an artificial one, particularly for cultivators; and on this account the present work should be in the hands of all gardeners and cultivators of plants; and the reference to the figures will also render it very useful to the botanist.—*Gentleman's Magazine.*

9.

Sixth Edition, in one large vol. 8vo, price 16*s.*

SWEET'S BOTANICAL CULTIVATOR; or, Hothouse and Greenhouse Manual: giving full Practical Instructions for the Management of all the Plants cultivated in the Hothouses, Greenhouses, Frames, and Borders, in the Gardens of Great Britain; with Plain Directions for the Management of Bulbs and Plants in Rooms, &c.

"Indeed what Mr. Sweet has said on the Culture of Bulbs and Epiphytes, in the last Edition of his Botanical Cultivator, may be considered as the *ultimatum* on this subject for the British Gardener."—*Gardener's Magazine.*

This Edition corresponds with the New Edition of Sweet's Hortus Britannicus, and contains for the first time, Genus Orchidaceæ.

10.

THE FRUIT-GROWER'S INSTRUCTOR. By GEORGE BLISS, Nurseryman. Containing full Directions for Planting and Cultivating of Fruit-trees; with Instructions for Forcing, and Lists of the best kinds of Fruit for every purpose: also Directions for Hothouse Building, and the most Improved Modes of Heating. Second Edition, enlarged, price 6*s.*

11.

THE FLORIST'S CULTIVATOR; or, Plain Directions for the Management of Florists' Flowers, Shrubs, &c.; select Lists of the most choice Flowers: to which is added the Monthly Operation usual for the Flower-garden, Shrubbery, and Greenhouse. By THOMAS WILLATS. Price 7*s.* 6*d.* coloured and bound in cloth.

WHITE TEETH. ROWLAND'S ODONTO, or PEARL DENTIFRICE.—This is an efficient White Powder for the Teeth, solely prepared from Oriental Herbs of the most delightful odour, and of sovereign virtue for strengthening, preserving, and thoroughly cleansing the Teeth. It eradicates tartar from the Teeth, removes spots of incipient decay, polishes and preserves the enamel, to which it gives a pearl-like whiteness; and, above all, from its disinfecting properties, gives sweetness to the breath. As an antiscorbutic, the gums also share in its transcendant powers. Scurvy is eradicated from them, a healthy action and redness are induced, that offer to the notice of the medical practitioner the most indubitable signs of their healthful state. Price 2*s* 9*d.* per box, duty included. *** NOTICE—The Name and Address of the Proprietors, A. ROWLAND AND SON, 20, Hatton Garden, London, are engraved on the Government Stamp which is pasted on each.

*** Be sure to ask for "ROWLAND'S."

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, May 21, 1842.

WEST LONDON GRAND FLORICULTURAL EXHIBITION, for Prizes of Two Silver Cups and Twenty-three Medals, under the superintendence of Mr. J. T. Neville, will be held in the Grounds of the Almshouses of the Butchers' Charitable Institution, at Walham Green, Fulham, on Wednesday, the 22d, and Thursday, the 23d June.

Also a LADIES' BAZAAR and FANCY FAIR, under the patronage of Her Most Gracious Majesty Queen Adelaide, in aid of he Building Fund.

Military and Quadrille Bands will attend. The Gates will be opened at 12 o'clock each day. Admission 1*s*.

Dyer's Buildings, Holborn. JAMES NESS, Sec.

EXHIBITION of AMERICAN PLANTS, under the immediate Patronage of H. R. H. the Duchess of Gloucester, and H. R. H. the Duke of Cambridge. WATERER'S GRAND EXHIBITION of AMERICAN PLANTS, now open at the Nursery, King's Road, Chelsea, from 10 till dusk. Admittance 1*s*. each. Tickets may be had of all the principal Seedsmen in London.

NEW FUCHSIAS.—JOHN SMITH, Nurseryman, Dalston, begs to announce that he has the following New and Distinct FUCHSIAS to offer this season, at the following prices:—F. princeps, 7*s*. 9*d*.; F. excelsa, 7*s*. 6*d*.; F. ilicifolia, 5*s*.; F. vernalis, 5*s*.; F. racemosa, 5*s*.; F. aurantia, 5*s*.; any person ordering the whole, 30*s*. J. S. trusts, from the general satisfaction given by the sorts sent out last year, that the above will prove worthy of the attention of Nurserymen as well as Amateurs. Strong plants of last year's sorts, 1*s*. 6*d*. each. A Post-office order is respectfully requested from unknown correspondents.—Dalston, May 27, 1842.

NEW AND SUPERB FUCHSIAS.—Messrs. W. and F. YOUELL continue sending out their splendid collection of the above, by post, free, to any part of the United Kingdom. For particulars see their Advertisement in the *Gardeners' Chronicle* of the 21st inst.

Great Yarmouth Nursery, May 26, 1842.

ARAUCARIA IMBRICATA.

MESSRS. W. and F. YOUELL beg respectfully to inform the Nobility and Gentry who are desirous of enriching their Arboretums and Plantations with this truly ornamental and hardy tree, that they are offering fine strong Plants, 2 years old, from seed, in pots, at 63*s*. per dozen, or 25*l*. per 100, which they will warrant perfectly hardy, having had several hundred standing fully exposed to the severity of the late winter, without receiving the slightest detriment, in a situation completely open to the north-easterly gales, and within 500 yards of the wash of the sea.

Those who are unacquainted with the habit and description of the above can obtain an engraving, taken from a plant in the Arboretum of the Earl of Orford, together with a description, by enclosing 4 postage stamps.

CEDRUS DEODARA.

Fine Plants of this elegant and ornamental hardy tree may also be obtained of Messrs. W. and F. Y., at the following prices:

3 years old, from seed, 9 to 11 inches, 84*s*. per dozen.
2 " " 5 to 7 " 63*s*. "

Great Yarmouth Nursery, Norfolk, May 19, 1842.

CHEAP SHOWY PLANTS FOR FLOWER-BEDS.

WILLIAM BARRATT begs to offer to Floriculturists, as below, CALCEOLARIAS, GERANIUMS, VERBENAS, FUCHSIAS, PANSIES, DAHLIAS, and other free-blooming Garden Flowers, at 4*s*. to 6*s*. per dozen; strong Plants ready for planting out. A fine collection of the above plants in named sorts, as well as other Greenhouse and Herbaceous plants for Rooms and Greenhouses.

About 10,000 GREENHOUSE HEATHS and EPACRISES, in fine health; worthy the attention of the Amateur and Nurseryman.

⁂ NATURAL GRASSES for permanent pasture, in selected sorts. Persons ordering these should give the quantity of ground, the situation and quality of the soil, and for what purpose wanted; doing this they may rely on having the proper kinds, and at not above one-third more expense than the old mixtures of Hay-seeds, which are very uncertain in producing good Herbage. Also, DWARF LAWN GRASSES; as much seed as will sow 100 square yards for from 3*s*. to 4*s*.

Wakefield Nursery, May 1842.

BEAUTIFUL NEW HEARTSEASE.

T. MELLON'S COLLECTION of SEEDLING HEARTSEASE is now being sent out. Parties desirous of purchasing may obtain specimen blooms by inclosing six postage stamps in a letter: or the whole collection may be seen daily at his Cigar and Snuff Warehouse, 71, New street, Birmingham.

17, Russell Row, Edgbaston.

FLOWER PROPS, of Wrought Iron, made upon an approved principle, in lengths of 2 ft. to 8 ft. Also, Garden Engines, Greenhouse Syringes, improved Watering Pots, Fumigating Bellows, Grass and Border Shears, Pruning Knives and Shears, and all other Horticultural Implements, upon the most advantageous terms, at Trudell and Edwards's, Wholesale and Retail Ironmongers, 46, Leadenhall-street, London.

MR. JOHN KING has received instructions to sell by Auction, on the 2d of June, 1842, at 3 o'clock, on the premises, West-street, London-fields, a very excellent Greenhouse, 50 feet long by 15 feet wide, in good repair; also a collection of Orange-trees, comprising the Malta, Tangerine, Mandarin, and Blood ditto; Limes, Lemons, Shaddock, Forbidden Fruit: altogether about 200 fine plants: Camellias of various sizes; strong Vines, in pots, &c. May be viewed until the sale. Catalogues may be had on the premises: at the Cat and Mutton, London fields: of Mr. Lake, Seedsman, Bishopsgate-street; and of the Auctioneer, Hackney-road.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to Public Competition, at the Auction Mart, Bartholomew-lane, on Tuesday, June 1st, Thursday 3rd, and Friday 4th, 1842, at 12 o'clock, about 500 of the most approved Dahlias, Splendid Geraniums, New Fuchsias, Verbenas, and a great variety of other Plants.

May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

BARNSBURY NURSERY, THORNHILL ROAD, ISLINGTON.

TO be SOLD by AUCTION, by Messrs. PROTHEROE and MORRIS, on Monday and Tuesday, June 14th and 15th, 1842, at 11 o'clock, upon the Premises, (unless previously disposed of by Private Contract,) the desirable LEASE, 45½ years unexpired, of the BARNSBURY NURSERY, at the low ground-rent of £20 per annum; several Newly-erected Greenhouses, Pits, Frames, choice Plants, and all the valuable Effects.

Particulars and Conditions to be had at the offices of Messrs. Pownall and Cross, 9, Staple's Inn, Holborn, and Mr. Phillips, 76, Great Titchfield-street, Portland-place, Solicitors; and upon the Premises of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. THOMAS ANSELL, jun., is instructed to submit to Public Competition, at the Auction Mart, Bartholomew-lane, on Tuesday, May 31st, at 12 o'clock, an unrivalled collection of all the most choice DAHLIAS of the present season; comprising among others the following new and superb varieties:—Hudson's Princess Royal, Rose Unique, Admiral Stopford, Westbury Rival, and numerous other kinds equally choice; and a vast number of older varieties.—New Fuchsias, Venus Victrix, Curtisii, Splendens (of Humboldt), and all the most approved varieties; Greenhouse Plants, Climbers, &c., &c.

Catalogues may be had at the Mart; and of the Auctioneer, Camden Nursery, Camden Town.

MAGNIFICENT COLLECTION OF ORCHIDACEOUS PLANTS.

WE are authorised to announce the intention of Mr. HARRISON of Liverpool to dispose of his entire collection of ORCHIDACEOUS PLANTS, in consequence of his being about to leave his present residence. This affords an opportunity, which seldom occurs, for the immediate acquisition of a very large number of the finest species of these brilliant plants, in excellent condition. Mr. Harrison was one of the first to cultivate such plants; his intercourse with South America has enabled him to acquire many species of great rarity, and, from the length of time that they have been in his possession, many of the specimens are, it is believed, unrivalled for size. Any one desirous of treating for the purchase of the entire collection must apply by letter to Richard Harrison, Esq., Aighburgh, Liverpool.

EMIGRATION TO NEW ZEALAND, under the NEW ZEALAND COMPANY, Incorporated by Royal Charter.

Governor.
JOSEPH SOMES, Esq.
Deputy-Governor—HON. FRANCIS BARING.

Sir Wm. Molesworth, Bart.
Alexander Nairne, Esq.
The Lord Mayor.
J. Abel Smith, Esq., M.P.
William Thompson, Esq., Alderman, M.P.
Hon. Frederick James Tollemache, M.P.
Arthur Willis, Esq.
George Fred. Young, Esq.

NOTICE IS HEREBY GIVEN, that Ships will be regularly despatched on the 1st day of every month during the present year, to one or more of the Company's Settlements of Wellington, Nelson, and New Plymouth.

In the Wellington District the Sales take place by Auction, and an allowance of 25 per cent. is made towards the passage-money of purchasers arriving from England.

Lands in the Nelson Settlement are sold in this country at the price of 300*l*. per allotment; comprising 1 town acre, 50 acres of accommodation, and 150 acres of rural land. Purchasers receive passage allowances not exceeding 25 per cent. upon their purchase-moneys.

Lands in New Plymouth are sold in this country to actual colonists at 75*l*. per allotment of 50 acres; and a town lot, with passage allowances not exceeding 25 per cent.

The Company continues to offer a Free Passage to Agricultural Labourers and Mechanics of good character, and eligible according to the regulations.

Maps and Views of the Country may be seen, and all necessary information obtained, by application at this House.

By order of the Court,
JOHN WARD, Secretary.
New Zealand House, Broad-street Buildings,
19th May, 1842.

SHIPS FOR NEW ZEALAND.—NOTICE IS HEREBY GIVEN, that the following Emigrant Ships have been Chartered by the New Zealand Company to sail from the ports and on the days undermentioned, viz.—

FOR NELSON.

THOMAS HARRISON, A 1, 355 Tons, from London, May 25th.
OLYMPUS, A 1, 316 Tons, from London, June 15th.
NEW ZEALAND, A 1, 380 Tons, from Greenock, July 1st.

FOR WELLINGTON.

GEORGE FYFE, A 1, 391 Tons, from London, June 15th.

FOR WELLINGTON and NEW PLYMOUTH.

BLENHEIM, A 1, 374 Tons, from Plymouth, July 1st.

Applications for Free Passage by labouring persons duly qualified are received daily at this House.

By order of the Court,
JOHN WARD, Secretary.
New Zealand House, Broad-street Buildings,
19th May, 1842.

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l*. for whole term of Life.

Age.	Annual Premium payable during 1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.

PETER MORRISON, Resident Director.
A liberal commission allowed to Solicitors and Agents.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

⁂ NUTT ON BEES (5th edition) now published.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*, with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering-pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

PORTABLE GREENHOUSES.— Several of these unique Drawing-room Ornaments (well established) for sale, at Mr. Viner's, Picture-frame Maker, 16, Tavistock-street, Covent-garden.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable: it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN. 390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronised their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l*. 5*s*. and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing, upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass, supplied in any number or quantity, at wholesale prices.

PATRONISED BY THE NOBILITY AND GENTRY.

AN IMPROVED GARDEN ENGINE (Registered); unequalled in Cheapness, Durability, and Effect. This Engine is adapted for every use, where a portable one is required, as in Greenhouses, in cleaning Shop fronts, &c.; at the same time it can be applied to a variety of purposes. It can be so constructed as to be attached to a tank or well, and by an additional hose will draw water from the depth of 30 ft., and force it to the height of 50 ft., in a continuous stream. It would be found a useful article on board of small craft, for wetting the sails, &c.—Manufactured by P. Jones, High-street, Fulham. Agents: E. Parks, 140, Fleet-street; J. Wilmot, Export Warehouse, 66, Gracechurch-street; Tibburt's, 44, Bishopsgate-street; Clark's Seed Warehouse, 86, High-street, Borough; and also at Waterer's American Plant Exhibition, King's Road, Chelsea.

On 4th June will be published, No. I., price 1½d., of

SUSAN HOPLEY, OR THE ADVENTURES OF A MAID-SERVANT.

In consequence of its great popularity, several wretched imitations of this NOVEL having been imposed on the Public, in Penny Numbers and Monthly Parts, under the titles of Susan Hopely, Susan Hoply, &c., the Author has thought it advisable to put forth a Genuine Cheap Edition, in Weekly Numbers, price Three Halfpence, each Number containing 16 Pages large Octavo; and in Monthly Parts, sewed, with a cover, price 7d. And in order to render the Work accessible to all classes, those parts of the Dialogue originally published in French are in this Edition rendered into English.

William Tait, Edinburgh; John M'Leod, Glasgow; W. S. Orr & Co., London; and W. Curry & Co., Dublin.

Now Ready,

In Imperial Quarto, splendidly bound in Morocco,

THE VESTIARIUM SCOTICUM. From an Original MS, formerly belonging to JOHN LESLIE, Bishop of Ross, collated with another in the Library of the Convent of St. Augustin, at Cadiz; containing a description of the

TARTANS OF THE HIGHLAND CLANS AND FEUDAL FAMILIES OF SCOTLAND IN THE FIFTEENTH CENTURY.

WITH A DISSERTATION UPON THE ORIGIN AND USE OF TARTAN.

By JOHN SOBIESKI STUART.

The Work is illustrated by 75 beautiful Plates of Tartans, executed upon hot-pressed Drawing Paper by an ingenious and elaborate process, for the first time applied to such a purpose, expressly for this Work; and which, to the accuracy of Copperplate Engaving, adds the detail of colours equal to that of silk woven in the loom.

The Work has been splendidly got up, at a great expense, and there are not quite FIFTY COPIES, of which only 45 are for sale, bound in morocco, gilt leaves, price Ten Guineas each.

William Tait, 107, Prince's-street, Edinburgh; T. and W. Boone, 29, New Bond-street; and Smith, Elder, and Co., 65, Cornhill, London.

Lately published, in demy 8vo, price 12*s*., Vol. VIII. of the

HISTORY OF SCOTLAND. By PATRICK FRASER TYTLER, Esq. Including the Captivity and Execution of Queen Mary.

The same volume will be published in post 8vo, price 6*s*., on 31st May.

"One more will complete the work, which, we venture to predict, will then become, and long remain, the standard History of Scotland."—*Quarterly Review.*

Second edition, in small 8vo, price 5*s*.

TALES OF THE GREAT AND BRAVE.—By M. FRASER TYTLER.

Containing Memoirs of Wallace, Bruce, the Black Prince, Joan of Arc, Richard Cœur de Lion, Prince Charles Edward Stuart, and Napoleon Bonaparte.

"A charming book, dedicated to a Boy, in anticipation of his fifth birth-day."—*Hereford Times.*

"This delightful little volume has found such acceptation among youthful readers, and all who love to gratify the young with amusing mental recreation, that a second edition has been called for."—*Caledonian Mercury.*

Now complete, in Eight Parts, to form Four Volumes 4to, price 8*l*. 8*s*.

JAMIESON's SCOTTISH DICTIONARY and SUPPLEMENT. Parts I. to IV. comprise a New and Improved Edition of the Original Dictionary, edited by JOHN JOHNSTONE. Parts V. to VIII. consist of a new issue of Dr. Jamieson's Supplement to his Dictionary; a work of equal size and value with the Original Dictionary itself.

In large 8vo, price 9*s*., Part II. of

MEMOIRS of JEREMY BENTHAM. By JOHN BOWRING. Including AUTOBIOGRAPHICAL CONVERSATIONS and CORRESPONDENCE.

Parts I. and II. of these Memoirs form Parts XIX. and XX. of the Works of Jeremy Bentham, but, like all the other Parts, may be had separately.

Parts XXI. and XXII., containing the Memoirs and Correspondence concluded; an ANALYTICAL INDEX to the whole Works of Bentham, including the Memoirs and Correspondence; and an INTRODUCTION to the Study of Bentham's Works, by JOHN HILL BURTON, Advocate, one of the Editors, will be published during this summer.

LORD BROUGHAM'S SPEECHES, &c., handsomely printed in four large Volumes, 8vo, under his Lordship's immediate superintendence, and originally published at 2*l*. 8*s*., now offered at 1*l*. 8*s*.

In small 8vo, price 5*s*.,

THE POEMS of ROBERT NICOLL, late Editor of *The Leeds Times*. A new and greatly augmented Edition, with a Memoir of the Author.

"'I have written *my heart* in my poems,' he wrote to a friend. This is the truth; and the poems will live because of it. . . . It is a genuine man's heart—keen, sensitive, strong, and impassioned, yet full of love. In such a life as this of ROBERT NICOLL, we discover the best part of the influence of Burns."—*Examiner,*

"Since the days of the immortal Burns, the works of no native poet, sprung from the peasant class of Scotsman, have excited a deeper interest than those of Robert Nicoll."—*Edinburgh Observer.*

"The effusions which grace this volume were penned by one whose life, though brief, was useful as an example, and interesting as a page in the book of human nature."—*Liverpool Albion.*

"We have perused with delight the unpretending verses which form the bulk of the volume before us."—*Liverpool Standard.*

"This is a most interesting volume. Nicoll was a young man who struggled into renown amid circumstances the most depressing. But in spite of these disadvantages, our youthful poet rose to an eminence second only to that of Burns."—*Hull Rockingham.*

"We envy that land which, from the ranks of its peasantry, can produce two such poets as Robert Burns and Robert Nicoll."—*Gloucester Journal.*

"Assuredly Nicoll fell little short of Burns in many compositions. Undoubted rays, emanating from the *mens divinior*, irradiate his verse. We have seldom had occasion to promise our readers more delight in the perusal of an author than this little volume will communicate to all who study it aright."—*Glasgow Constitutional.*

"His poetry is full of manly sentiment and warm feeling, poured out in rhymes at once animated and correct."—*Dumfries Herald.*

"Some of the fugitive pieces in the volume before us may take their place beside the best productions of the best Scottish bards; they may bear comparison, indeed, with those of the immortal Burns himself."—*Yorkshireman.*

"Unstained and pure, at the age of 23, died Scotland's second Burns."—*Ebenezer Elliott.*

TAIT'S EDINBURGH MAGAZINE for JUNE, price 1*s*., will contain:—Abednego, the Money-lender; by Mrs. Gore; chap. IX. X.—Ebenezer Elliott on Cowper and Burns—Sturge's Visit to the United States in 1841—Irish Treason in Paris; by the O'Hara Family: concluded—Colliers and Collieries—Hydropathy, or the Cold Water Cure—Miss Burney's Diary and Letters; vol. III.; the Court of George III.—Sir Thos. Dick Lauder's Edition of Price on the Picturesque—Poetry; the Song of June, &c.—Literary Register—Postscript Political.

Wm. Tait, Edinburgh; and Simpkin, Marshall, and Co., London. Orders received by all Booksellers.

MECHI'S 25*s*. DRESSING-CASES in Russia Leather invented by himself) are now fully established as the cheapest, most portable, and, at the same time, most complete, ever introduced. The same with hair-brush and soap-dish, 35*s*.; ditto, with a great variety of instruments, 55*s*.; the French pouch dressing-case, 4*l*. 6*s*.; the Blucher ditto, 3*l*. 10*s*. and 3*l*. 15*s*.; ladies' silver dressing-cases, 5*l*. 15*s*. and upwards; desks, work-boxes, leather writing-cases, and despatch-boxes, pocket-books, card-cases, and envelope-boxes. Manufactured on the premises, No. 4, Leadenhall-street, London. A Show-room up-stairs for Mechi's splendid stock of papier-maché tables, tea-trays, and other manufactures.

WANTED, a PARTNER, in the NURSERY and SEED Business, in a central part of the Midland Counties. Any person with small capital will find this an excellent opportunity. Also an Apprentice wanted, to board in the house.—Letters (paid) addressed P. W., office of this Paper, will meet with attention.

WANTED in the Country, a Single Young Man, of good address, competent to manage a SEED BUSINESS, and who has some knowledge of plants. Unexceptionable testimonials as to character, &c., will be required.—Apply, post-paid, to Mr. W. Bristow, Knightsbridge, London.

BRITISH MOTHS and their TRANSFORMATIONS; exhibited in a series of Coloured Plates, by H. N. HUMPHREYS, Esq.; with Descriptions by J. O. WESTWOOD, Esq., F.L.S., &c.

London: Published by William Smith, 113, Fleet-street.

IMPORTANT TO AGRICULTURISTS, &c. &c.

Just published, and sold by Maish and Co., 1, New Bridge-street, Vauxhall, price 1*s*.,

A WORD OR TWO ON GUANO and a NEW MANURE—ARTIFICIAL GUANO.

By W. H. POTTER, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15*s*. per cwt. cash.—Chemical Works, Upper Fore-street, London.

A New Edition, corrected, with a Supplement, containing above 160 additional pages of letter-press and nearly 300 New Engravings, bringing down the Work to 1842; in One very thick vol. 8vo of above 1300 pages, and 2000 Engravings on Wood, 3*l*. 3*s*. bound in cloth, AN

ENCYCLOPÆDIA of COTTAGE, FARM, and VILLA ARCHITECTURE and FURNITURE: containing Designs for Cottages, Villas, Farm-houses, Farmeries, Country Inns, Public-houses, Parochial Schools, &c., with the requisite Fittings-up, Fixtures, and Furniture, and appropriate Offices, Gardens, and Garden Scenery; each Design accompanied by Analytical and Critical Remarks illustrative of the Principles of Architectural Science and Taste on which it is composed, and General Estimates of the Expense.

By J. C. LOUDON, F.L.S., &c.

*** The NEW SUPPLEMENT *separately*, 7*s*. 6*d*. sewed.

"No single work has ever effected so much good in improving the internal arrangement and the external appearance of country dwellings generally."—*Times.*

London: Longman, Brown, Green, and Longmans.

ARBORETUM ET FRUTICETUM ABRIDGED.

In 8vo (pp. 1162), with upwards of 2000 Engravings on Wood, 2*l*. 10*s*. bound in cloth, AN

ENCYCLOPÆDIA of TREES and SHRUBS; being the Arboretum et Fruticetum Britannicum abridged: containing the Hardy Trees and Shrubs of Great Britain, Native and Foreign, Scientifically and Popularly described; with their Propagation, Culture, and Uses in the Arts; and with Engravings of nearly all the Species. Adapted for the use of Nurserymen, Gardeners, and Foresters. By J. C. LOUDON, F.L.S., &c.

"In its present form, this valuable work is placed within the reach of thousands who could not hope to obtain it unabridged, and we strongly recommend it to universal patronage."

Dr. LINDLEY, in *Gardeners' Chronicle.*

London: Longman, Brown, Green, and Longmans.

PROPOSALS TO ABOLISH ALL POOR-LAWS, except for the Old and Infirm, and to establish ASYLUM FARMS, on which to locate the Destitute Able-bodied Poor, who might thereon maintain themselves, and benefit the Country 18,600,000*l*. annually.

"Prosperity could never be reached and maintained in this country without some provision for the *regular employment* of the Poor."—*Mr. Beckett's Speech in the House of Commons, Feb. 3d, 1842.*

By R. J. MARRISON, Esq.,

Formerly Agent to the Kent Agricultural College, and Lecturer on Agricultural Education.

London: Published by Sherwood, Gilbert, and Piper, 23, Paternoster-row. Price 6*d*.

On the 1st of June, price 7*s*. cloth, Part I. of

THE PHYTOLOGIST; a Popular Botanical Miscellany. The Contributions are by C. C. Babington, Miss Beever, W. Borrer, Rev. W. T. Bree, Dr. Bromfield, D. Cameron, Miss Carpenter, Rev. F. F. Clark, H. Doubleday, E. Doubleday, T. B. Flower, S. Gibson, Dr. Greville, Mrs. Griffiths, L. H. Grindon, J. W. G. Gutch, Rev. W. S. Hore, Rev. C. A. Johns, Al. Irvine, Edwin Lees, W. A. Leighton, G. Luxford, B. Maund, J. S. Mill, E. Newman, J. Ralfs, T. G. Rylands, Mrs. Riley, J. Riley, J. D. Salmon, S. Simpson, R. Spruce, W. A. Stables, J. Tatham, jun., G. H. K. Thwaites, N. B. Ward, H. C. Watson, F. Westcott, W. Wilson, Dr. Wood, Miss Worsley, and other eminent British Botanists. Many of the papers are illustrated with expensive woodcuts.

☞ The PHYTOLOGIST will in future be published in monthly Numbers, price 1*s*. each.

John Van Voorst, Paternoster-row.

A new Edition, considerably improved and enlarged.

LOUDON'S ENCYCLOPÆDIA of GARDENING; the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape Gardening, including all the latest Improvements, a general view of Gardening in all Countries, and a Statistical View of its present State, with Suggestions for its future progress in the British Isles, &c. With nearly 1000 Engravings on Wood, 50*s*. boards.

II.

A New Edition, with SUPPLEMENT, of

LOUDON'S ENCYCLOPÆDIA of PLANTS; a Description of all the Plants in Great Britain, down to 1840, with nearly 10,000 Figures, by Branston, from Drawings by J. D. C. Sowerby, F.L.S. One thick vol. 8vo, 3*l*. 13*s*. 6*d*. cloth.

*** The SUPPLEMENT, edited by J. C. Loudon, prepared by W. H. Baxter, Jun., and revised by Geo. Don, F.L.S., with upwards of 800 additional Figures, separately, price 15*s*.

III.

LOUDON'S ENCYCLOPÆDIA of AGRICULTURE. Third Edition, with nearly 1300 Wood Engravings, one large vol. 8vo, price 2*l*. 10*s*. cloth lettered.

IV.

LOUDON'S HORTUS BRITANNICUS; a Catalogue of all the Plants indigenous to or introduced into Britain. New Edition, with a NEW SUPPLEMENT up to March 1839, prepared, under the direction of J. C. Loudon, by W. H. Baxter, and revised by Geo. Don, F.L.S., 8vo, price 1*l*. 11*s*. 6*d*. cloth lettered. SUPPLEMENT, separately, 8*s*.

London: Longman, Brown, Green, and Longmans.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.

The Second Exhibition will take place on Saturday, the 11th of June. Subjects for Exhibition must be at this Office on Friday, the 10th of June, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition. The Gates will be opened at One, P.M.—Tickets are issued to Fellows at this Office, price 5s. each; or at the Garden in the afternoon of the days of Exhibition at 10s. each; but none will be issued without an order from a Fellow of the Society.—21, Regent-street.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price *3d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies required.

The Gardeners' Chronicle.

MEETINGS IN THE ENSUING WEEK.
Wednesday . . . . Geological . . . . . . 8½ P. M.
Friday . . . . . . Botanical . . . . . . 8 P. M.
COUNTRY SHOWS.—May 31, Hammersmith Heartsease. June 2, Wingham Floricultural—Hoddesdon, Broxbourne, and Amwell Cottagers. 3, Louth.

SINCE last week we have learned two things respecting Asparagus: one, that the quality of that grown at Nice, in the manner we have described, is delicious; the other, that it is doubtful whether the experiment will succeed here just now. Should this turn out to be the fact, no one should be discouraged by it, for the reason can be explained and the obstacle to success removed. The cause of failure, if failure there be, will be the want of sufficient bottom-heat, which is always small in this country, and in the present season, owing to the cold nights we have been so long experiencing, very deficient compared with a country in which the Date Palm can live without protection. At Nice the sun beats fiercely on the ground, even during the spring; the rays are absorbed by the soil, and the ground, which is thus gradually heated, stimulates all vegetation into an activity unknown with us, except under artificial circumstances. To use the words of a fair correspondent, now writing from those countries, "It is quite provoking to see the increased vigour and brilliancy of colour that all flowers here have, without any care but that of the sun—but that is all-powerful; and I fear the want of it will often put me out of humour when I return to dear old England. I have several times thought that I had found rare and beauteous, or rather, wholly new flowers; but on closer inspection, and consultation of books, I have found they were known and already figured in England—in small size and dim colour, such as our climate gives us."

For advantages like this the warmth of our brightest days in spring offers little compensation, and, if incessantly succeeded by frosty nights, none at all.

It is then probable, that without some means of warming the earth of the Asparagus-beds artificially, the shoots may not push strongly enough, nor branch with sufficient rapidity in the bottle, to acquire the necessary succulence and delicacy. In that event, the remedy will be, another season, to line the Asparagus-beds with stable litter, made up in the deep alleys that divide them, as is often practised in Russia and elsewhere. Under these circumstances, and with such assistance, the Asparagus will be sure to grow with all the necessary vigour.

In the mean while, as some compensation for the possible disappointment that may have attended the experiment in question, let us recommend an improvement in the cookery of this vegetable, which we borrow from the Germans. We are no admirers of the sodden toast that Asparagus lies on when brought to table, nor does the general appearance of the dish indicate great skill on the part of our cooks. It will be found much better to leave the toast in the kitchen, to substitute for it Dutch sauce (*vide Mrs. Rundell*), to place the Asparagus on it, and then to powder the heads pretty thickly with fried bread-crumbs. This is a receipt worthy of Apicius.

WE have shown (p. 238) all organised matter to be formed, for the most part, from water and certain air-like, invisible, untouchable substances, which are united with each other, and condensed into a solid state. It is in reality a literal truth that man himself, the animals he employs, the reptiles that annoy him, and the many forms of plants that surround him, are all composed of air and a little earth. The wonderful powers of nature, when called into action by the will of the Creator, cause the most subtile elements to blend themselves in a thousand varied ways, and to assume disguises in which it is the eye of science alone that can detect them. If the organic world when living is thus all formed out of such materials, it is only to be expected that it should be changed to them again in death; and we might add, that *in that change alone* they should recover the property of recombining into new living forms.

Hence it is that matter *can* only act as manure when it is dissolved in water or changed into air. Plants feed to a great extent on charcoal, but it is of no use to surround them with that substance; it is only when charcoal is changed into the air called carbonic acid that plants can consume it. One of the most powerful of all substances is meat: throw a dead dog into a hole at the foot of a Whitethorn-bush, and see how readily the bush will grow; but if the meat were always fresh, it would not produce such an effect, because in that case it would neither dissolve in water nor change into air; it is only when it decays that its elements, that is to say, the air and earthy matters out of which it was originally fashioned into a living, moving, breathing thing, by the infusion of that mysterious attribute called life—it is, we say, only when it decays that these elements are again separated, become once more what they were at first, and are enabled to enter into the composition of some other organised being, whether animal or plant. Let them thus separate in the perishing remains of the dog, and they will be caught up in the water that surrounds the roots of the Whitethorn-bush, be dissolved in it, and presented to the plant as food, which, as soon as it has entered its stem and leaves, adds to their size and substance.

This is one of the reasons why fluid manure is so much more rapid in its action than such as is dry: in the former case, the food of plants is necessarily already formed, and can be seized upon the moment it reaches the roots; but when manure is dry, it must first be dissolved by rain, supposing it to be dissolvable; and if that is not the case, it must lie in the ground until it has decayed so much as to be dissolvable, which *must* require some time, and *may* require a very long time.

All this may seem so obviously true as not to be worth mentioning. We shall probably be told that everybody knows of it; and it must be confessed, that in such countries as Belgium the common practices of husbandry prove that it is well understood. We are also aware that, to many intelligent farmers and gardeners in England as well as other countries, statements of this sort seem superfluous. Nevertheless, on a future occasion we shall endeavour to show that if these principles are understood, they are not only not acted upon, but are continually lost sight of in the most ordinary operations.

IT may be interesting to our readers to know that the Ornithological Society of London, to whom the public is so greatly indebted for the beautiful waterfowl on the lake in St. James's Park, have extended their operations into Hyde Park and Kensington Gardens. Two floating islands have been constructed in the Serpentine, and three broods of wild ducks have already been hatched in them. The stock there is at present small, consisting of about 30 fancy birds and about the same number of young ones; but the point has been gained of forming a nucleus, to which we are sure our ornithological friends who have the power will gladly add.

It is a great object to render these places of public resort interesting to the lower orders by every possible means, for it is thus that they will be gradually weaned from beer-shops and pot-houses. Green turf and trees are in themselves delightful to all in whose bosoms vice has not wholly destroyed the natural feelings; but experience proves that the pleasurable emotions produced by such objects are very much heightened when birds and animals, especially such as are not of everyday occurrence, are intermixed with them.

In St. James's Park itself the collection is increasing steadily. Both Egyptian and Sandwich Island geese have hatched upon the island; and the attraction of this favourite place has been lately increased by the addition of 900 young trees, which the Noble Lord at the head of the Woods and Forests has caused to be planted round the edge of the clumps, and labelled as in an Arboretum.

FAMILIAR BOTANY.—No. VII.

The Laburnum.—If we place the flowers of a Garden Pea and of the Laburnum side by side, we shall find so striking a resemblance between them, that at first sight little difference will be observed, except that the one is white and the other yellow. Both will have a corolla of the singular form which Botanists call papilionaceous, or butterfly-shaped; this consists in a peculiar arrangement of five petals, thus: one petal is large, broad, and stands at the back of the others; two are narrow and convex, and are placed right and left of a hollow part, consisting of two other petals, joined by their edges into a sort of boat. The first is called the *standard*, the second are *wings*, and the third, or boat-shaped part, is the *keel*. These five petals make up the butterfly structure: but why this odd name should have been given to such flowers, it passes my skill to explain. In the hollow of the boat, or keel, lies a tube of stamens, terminated by 10 golden anthers; and in the middle of them is enfolded a young pod. An attentive study of these flowers will, however, tell you, that although they are very like each other, there are some differences in the form of the calyx and the petals, as well as in their colour. It is because of such differences that they are not both called Peas, or both Laburnums; it is because of such resemblances that they are both classed in the Papilionaceous order; to which belong, for the same reason, the Bean, the Kidney Bean, and the Vetch, together with Lucerne, Clover, Sainfoin, and similar plants.

Now, as all these species just named are the food of either man or beast, it has been supposed that any other papilionaceous flower would indicate a harmless or eatable plant. This, however, is a great error.

It may seem strange that such plants as I have named should really belong to a poisonous group, and yet such is undoubtedly the fact; the common Pulse and Furze plants, with which we are so familiar, are the exception, rather than the rule. It is in the hotter countries of the world that papilionaceous plants most abound, and in those places poisonous species are frequent. Among the contrivances of barbarous nations to supply themselves with food, the intoxication of fish is one of the most common; this is effected by bruising the leaves of poisonous plants, and throwing them into the water, when the fish, becoming stupified, rise to the surface, as if dead, and are easily caught. Many of the most powerful fish-poisons are obtained from papilionaceous plants. Other species are active medicines, like the common Broom; and they owe this quality to their containing some deleterious substance which in small quantities is medicine, in a state of concentration is poisonous.

It has for many years been found that the mortality among the cattle in the Swan River colony is caused by feeding on some kind of dangerous herbage. Many attempts were made to discover the enemy, and for some time a beautiful lobeliaceous plant called Isotoma Brownii was strongly suspected of being it. Now, however, it has been found out that the animals have been poisoned by Gompholóbiums, whose gay papilionaceous flowers are admired by us without a suspicion of the danger that lurks beneath their glittering forms.

I might fill a book with such cases, but enough has been said to show that in distant countries papilionaceous plants are very often poisonous. If so, why should we be surprised that they are dangerous here at home? We are misled by the exceptions, and lose sight of the rule. It is the large quantity of starch contained in Pulse which renders it nutritious, and in a few cases the deleterious properties of the Papilionaceous order are so feeble as to be of no importance. And yet there are kinds of Pulse which we must take care how we eat. Did we never hear of horses becoming blind by feeding on Beans? There is a sort of Vetch, called Lathyrus Cicera, which is common in some parts of France, and of which the green peas may be eaten without danger; but when they are ripe they become poisonous: medical men tell us that when accidentally mixed with flour and made into bread, they produce an incapability of walking, a draggling gait, with the toes turned inwards, and convulsive twitches of the legs, or in other cases such stiffness that the knee-joint cannot be moved. The like evil propensities are found in some kinds of Tares, particularly in an ill-looking plant called Ervum Ervilia. In France, where bad farming is sometimes carried to perfection, in the year 1815 a great deal of this grew up with the grain, in consequence of the wetness of the season; and thus its seeds were mixed with Wheat and Rye. Bread made from this flour produced such great weakness of the limbs that men staggered about, or tottered, and could not walk without the aid of a stick; even the horses became almost paralytic when their corn was mixed with such seeds.

Surely, then, there is nothing to wonder at in finding the Laburnum, a papilionaceous plant, also producing its share of mischief, and poisoning the children whom heedless nurses amuse with its seeds. So common is this, that I do not remember a season in which accidents, more or less serious, have not occurred. Let me add, for the benefit of the readers of the *Chronicle*, that when children are thus poisoned, they may generally be recovered by emptying the stomach with a plentiful dose of mustard and warm water; and it may prevent unnecessary alarm to mention, that by such means life has been saved when the child has become insensible, and the features livid.—*R. E.*

COCKROACHES.

I WOULD good-humouredly submit, whether most of the plans devised for destroying these very troublesome inmates do not simply amount to the celebrated receipt for hare soup, "first catch your hare,"—first catch your Cockroaches in a trap. But your old Cockroach is a very cunning gentleman, and, though *facilis descensus Averni*, is not to be so easily inveigled into a pot, although many of his less discreet progeny may doubtless be thus engulphed. By perseverance in trap-setting, and annual catchings, the colony may be somewhat thinned, but not eradicated. If your correspondents will try the following simple plan, I will warrant them that every Beetle and Cockroach will shortly disappear, and that the kitchen will not again be infested. Add about a tea-spoonful of powdered arsenic to a large table-spoonful of mashed boiled Potatoes; rub and mix them well together, and then crumble about a third of it every night at bed-time about the kitchen hearth—it will be all eaten up, or nearly so, by the following morning. The creature is very fond of Potatoes, and, devouring them greedily, when thus poisoned, crawls again into its hole and perishes. I had occasion to have some alteration made in the kitchen stove, six months after I had adopted this plan, and found hundreds of wings and dried mummies of defunct Cockroaches; their disappearance was not attended with the slightest perceptible smell, and though five years have elapsed, not one has again been seen in my kitchen. I have, the last four days, confined four woodlice, the great pest of garden frames, under a flower-pot, with a little of the arseniated Potatoe; but, like Sir Robert with the old budget, they wont bite. The whole process should be entrusted only to a careful individual; and any remaining crumbs should be cleanly swept up every morning. —*F. R. Horner, M. D., Hull.*

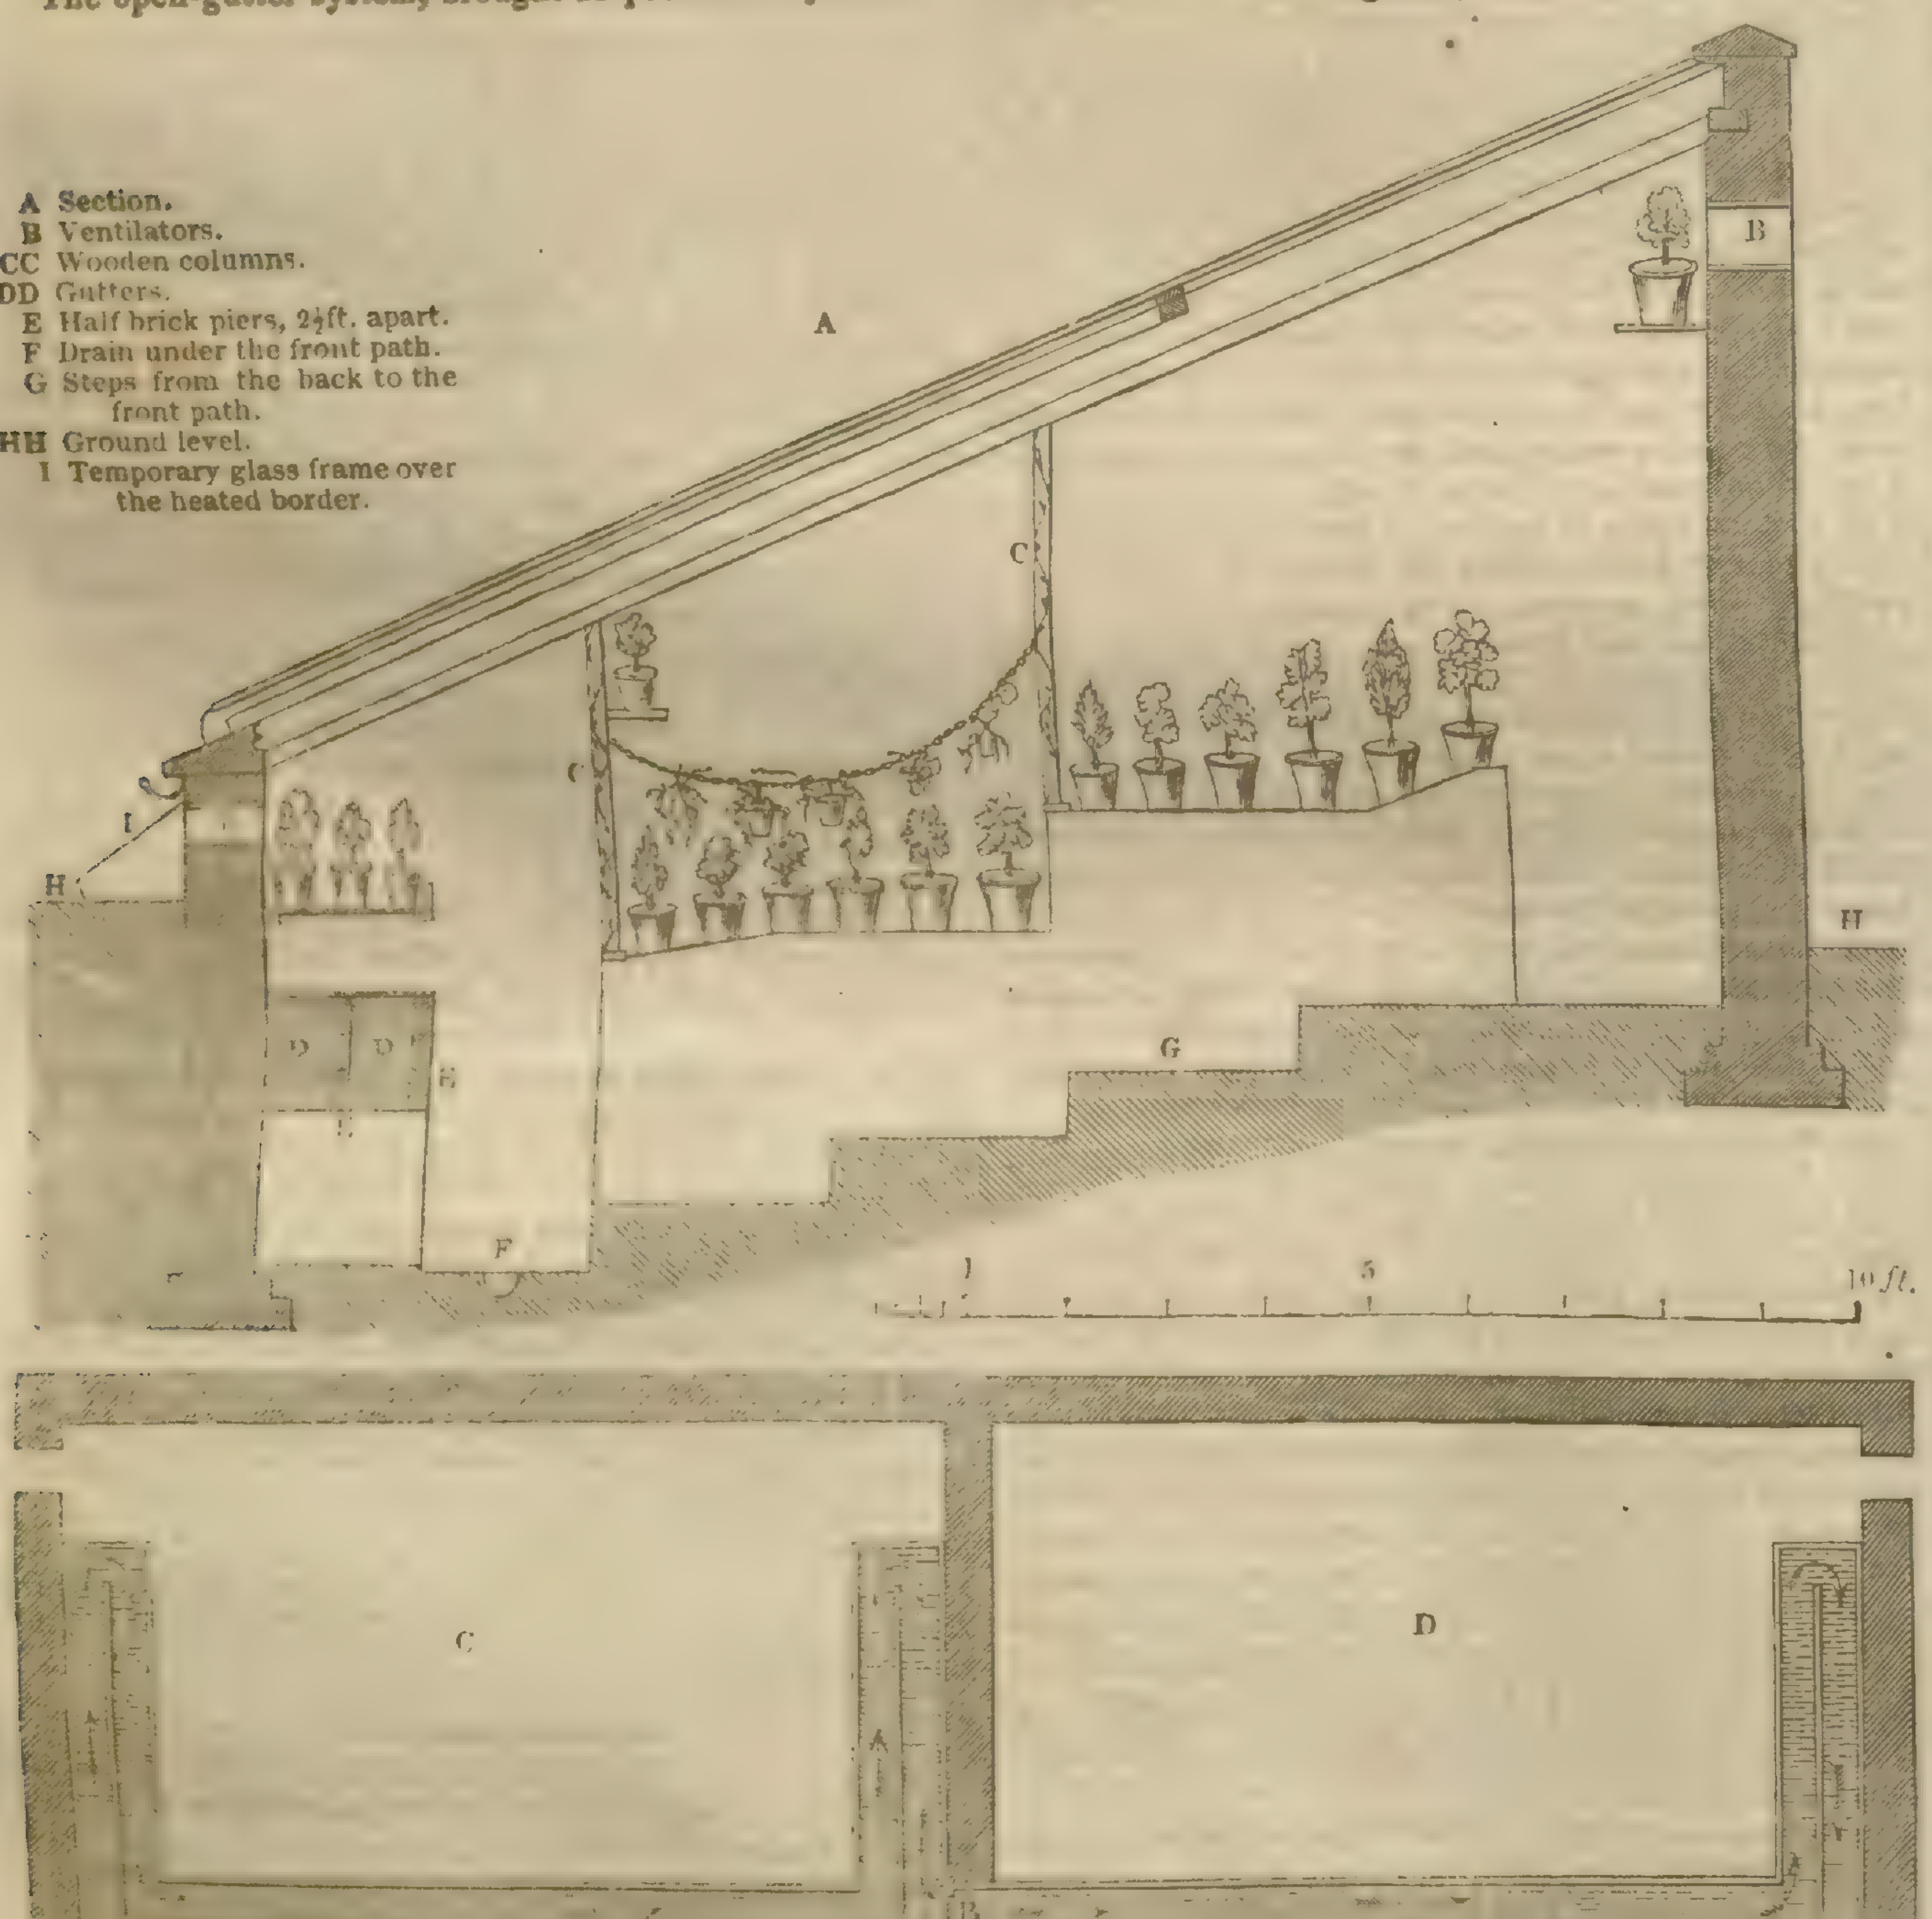
HEATING HOTHOUSES.

LAST autumn we altered a stove and a Geranium-house here, which were under the same range, and heated by smoke-flues, with a view of devoting the stove to the culture of Orchidáceæ. The Geranium-house (divided from the stove by a glass partition) being so conveniently situated for an intermediate house, in which we might grow the hardier Orchidáceæ and many other plants (too tender for a greenhouse, and not requiring the full heat of a stove,) I recommended that it should be heated for that purpose with the stove, and by the same apparatus, being glad, under any pretext, to get rid of the nuisance of smoke-flues.

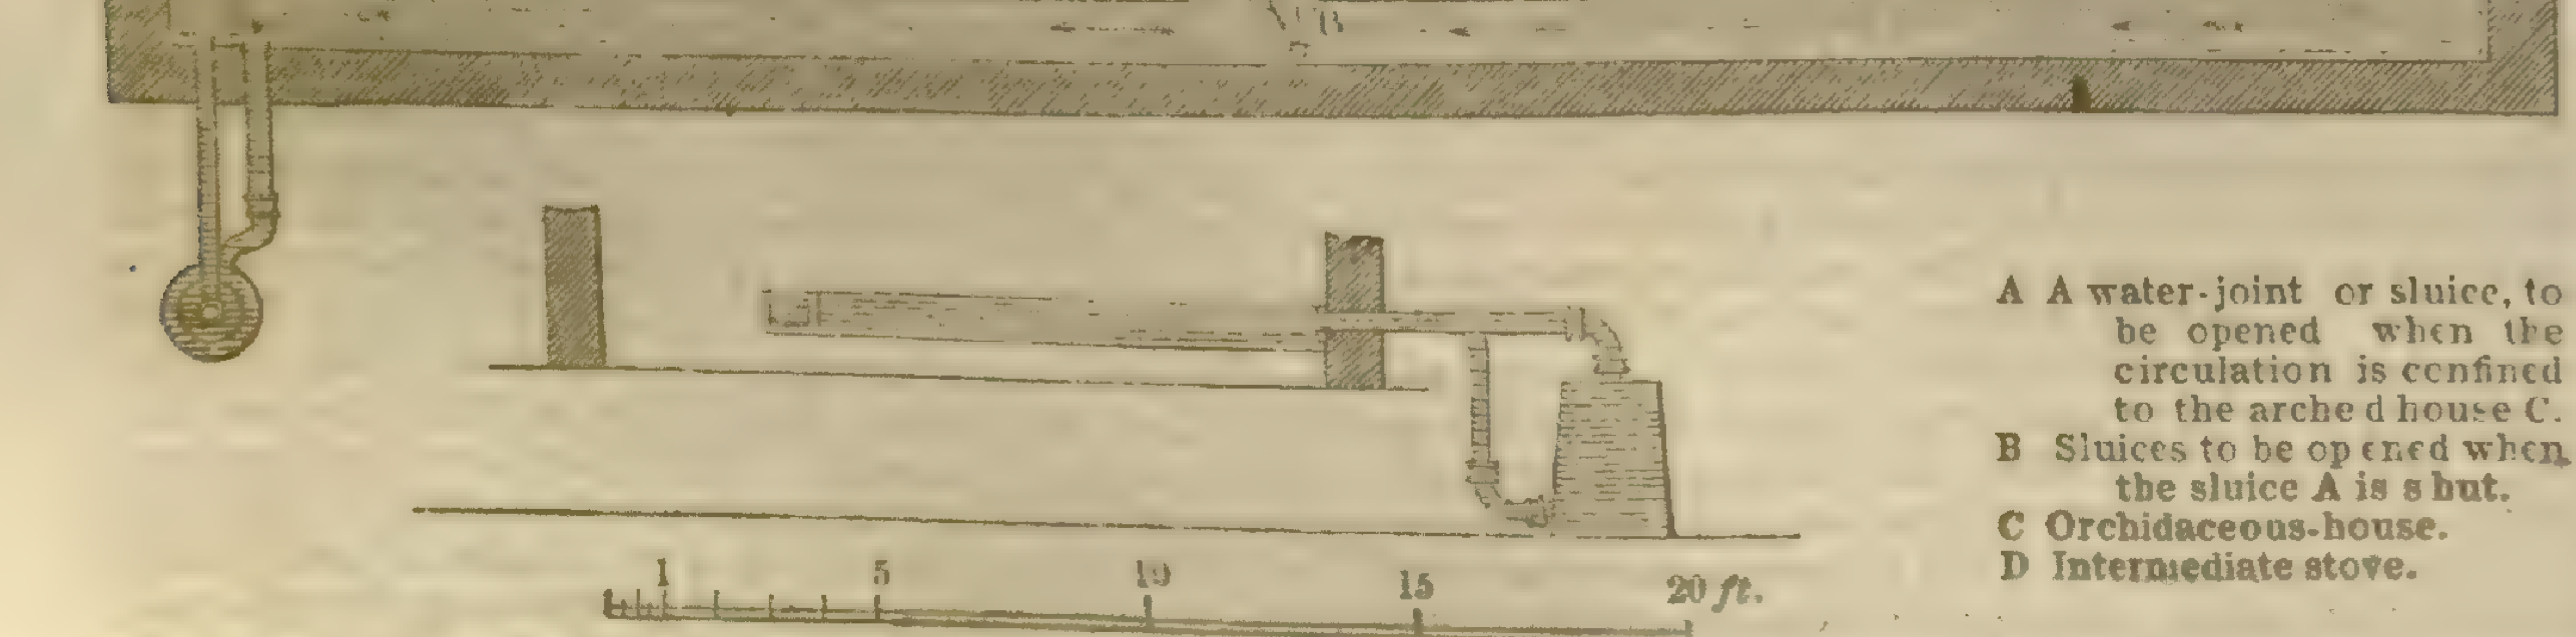
Of late years we have had under discussion so many modes of applying hot water to horticultural purposes, that it became a matter of some difficulty to make a suitable choice, which might embrace the various improvements, and at the same time be simple in construction and economical both in the erection and in the after-management. These points should be held of the first importance by gardeners, seeing that we follow out our plans with other people's purses. The general extension of the cultivation of Orchidáceæ, of late years, has overturned the notions we entertained of hot-water pipes 12 years ago: this is proved by the endless contrivances superadded to the pipes, and to the expense of erection, for providing a suitable degree of moisture to the atmosphere of hothouses.

The open-gutter system, brought so prominently before us last year by Mr. Corbett's patent, appearing to supply heat and moisture more simply than any other, I decided on its adoption. On inquiry, however, I found this would be as quite expensive as the pipe system in the usual way; and what (to me) was of great consequence, on the approach of winter, that our ironmonger would require more time to get the castings ready than I could spare without endangering our plants. I therefore sketched out a plan for myself, which—without any pretensions to originality, but merely a combination of existing contrivances—has proved, during the last six months, to be as efficient, more simple, and by far less expensive than any other hitherto recommended; embracing all the essential improvements suggested by Mr. Rogers, Mr. Ainger, Mr. Green (see *Chronicle*, 1841, page 597). Moreover, the plan is as suitable for greenhouses and for forcing-houses of every description, as it is for growing Orchidáceæ; and the small expense of it will bring the luxury of hot water within the means of the possessor of the humblest greenhouse.

The plan and section will exemplify the apparatus with little or no description; the scale on which the plan is drawn is not quite true, but the section was taken expressly for this communication. The erection of the gutters was determined by the course of the old flues, and the reason for placing the boiler in front of the stove, and about 7 feet from it, is, that a range of Melon-pits in front is to be heated from the same boiler. But these minor details must always be guided by local circumstances. It will be seen that I have adopted the open-gutter system, in lieu of iron pipes; that the return gutter is on a level with the flow one, and when both are covered, the appearance is that of a common flue, three bricks on edge deep—the gutters being covered with common flat roofing tiles, and set in common mortar, with open spaces left here and there, into which fit pieces of slate, for letting out or stopping the vapour. The side and division bricks are set in cement; the front wall forming one side of the return gutter, and having a coat of cement, with which the inside of the flow gutter next the house is also covered. The division in the middle is merely built in cement, the bottom being formed of slabs of Welsh slate, half an inch thick, resting on brick piers; but I would advise no one to use slate bottoms, as I found some difficulty in getting the cement to stick to it. Under great pressure, the best way is to build the bottom on arches and cement them, which is quite as cheap, making the corners of tiles or common roofing slate, only fixed with mortar, leaving open spaces to let out vapour over the *return gutter only*. I have only four spaces, about 6 inches wide, left for our Orchidaceous house, and I seldom use more than two of them at a time, and never in dull weather. Although I have got a space of a foot deep in the gutters, I only filled them this mild winter to the depth of 5 inches with water; and now about 3 inches are sufficient for my purpose, the water in the flow gutter not being more than 170 degrees at any time, so that I have ample command of heat for a house twice the size. In setting the boiler, a small space was left open in the brickwork on each side of the fireplace, for a current of cold air to pass round the brickwork and pass into the space inclosing the pipes, from thence into the flow gutter, and afterwards circulating round the house over the water, and driving out the vapour with greater force on its way back over the return gutter. There is also a provision for letting this current of hot air into the house without passing over the water. The return-pipe is fixed 1 inch above the level of the bottom of the gutter, thus insuring a space for any sediments in the water to subside into, instead of finding their way into the boiler. The flow pipe enters the gutter 2 inches higher than the return one; the boiler being placed lower than the gutters, both pipes might enter them upon the same level; and the reason for fixing the flow pipe higher was, that sometimes in summer very little fire might be wanted, and by reducing the water in the gutters till the top pipe was empty, the water in the boiler might be boiled, and a volume of steam issued into the gutters, which, after passing the circuit of the house, would be reduced to a mild vapour previously to entering the house by the open spaces over the return gutter. Where the water enters the intermediate stove I made a provision for stopping the circulation by dropping down two pieces of slate, in grooves made in the cement, like a common sluice, and by taking up a similar piece in the centre division at A in the plan. By this means I insure heat, moisture, dry heat, and moist heat, working one or both houses at the same time, without a single pipe, valve, or stopcock, and without a possibility of any part of the machinery ever getting deranged. The expense by contract, including the pulling down of the old flue, was under 10*l.*; the bricks in the old flue were used for the gutters, and we provided the covers. The estimate for furnishing 4-inch pipes for the same job, without clearing away the old flue, was 25*l.*; neither estimate taking the boiler into account. The boiler, as will be seen by the plan, is the conical one of Mr. Rogers, and nothing but coke is burnt. It will be seen that I have sacrificed some degrees of heat by making use of the front wall as one side of the return gutter; but this was for the purpose of heating the border outside the house, which will be seen by the ground line in the section to be above the level of the gutters, for the purpose of growing Hippeastra and such like bulbs. Where a range of low pits is attached to the front of a house, this would be a means of heating it at a trifling expense. Where neither a border nor pits are to be heated in this way, the gutters ought to stand 3 or 4 inches from the front wall, to insure all the heat to the inside of the house.



A Section.
B Ventilators.
CC Wooden columns.
DD Gutters.
E Half brick piers, 2½ft. apart.
F Drain under the front path.
G Steps from the back to the front path.
HH Ground level.
I Temporary glass frame over the heated border.



A A water-joint or sluice, to be opened when the circulation is confined to the arched house C.
B Sluices to be opened when the sluice A is shut.
C Orchidaceous-house.
D Intermediate stove.

The heat produced by this apparatus is more congenial to vegetation than that of any other hitherto thought of. It is even better than that of hotbeds, judging from the eagerness with which the foreman in the forcing department wishes to have his young Melon and Cucumber plants reared in this house, in preference to his M'Phail pits; because, as he told me very earnestly, he sees "that the heat of it was more proper for that sort of plants." Wishing to know how far his observation might be right, I sowed a pot of Cucumber seeds and placed it on the top of the gutters, transplanting the seedlings and rearing them in the same place. They are now showing fruit, and are much stronger than plants from the same packet of seeds reared in the pits, and at the earnest requests of the young men, I gave up to them the front shelf over the gutters to plant out the Cucumbers in, which are to be trained and fruited over the Orchidaceæ, by way of shade and experiment in proving the qualities of reputed new kinds.

In the intermediate stove the covers are constantly on the gutters, but when we shut up the house very close at night there is a perceptible dew on the leaves early in the morning from the evaporation through tile-covers. We shall never have any occasion to use a syringe or any sprinkling of water in either house, and I am so satisfied with the plan, that I can confidently recommend it.—*D. Beaton, Shrubland Park Gardens.*

AMATEUR'S GARDEN.—No. XXII.

WINDOW gardening, being practised more or less by every lady who is fond of plants, has for this reason great claims to attention, and I advert to it more particularly now, in order to answer fully some questions put by a correspondent, "Omega," a fortnight or three weeks ago. He asks whether pans or saucers filled with water and placed below the pots, are of any use to the plants, or if they are, as some assert, injurious? and further, if they are beneficial to some and not to others, and how he is to know the different kinds? Now, in so far as the plants are concerned, except these are aquatics, I think pans kept full of water do more harm than good. If it was otherwise, would they not be in more general use in greenhouses and conservatories; and yet every one knows that in places of this kind, such things are seldom or never seen. The fact is, delicate plants would be much injured by them, as the water would be constantly bringing down the soil and choking the drainage; and the roots would get rotted amongst sour soil. But pans are, notwithstanding, very useful things; and this the servants or housekeeper would soon explain if such articles were attempted to be dispensed with. Many plants, such as Pelargoniums and Fuchsias, will doubtless thrive very well even if the pans are kept constantly full; and I have even known persons who mentioned that the water ought to be supplied from the pans, and who never gave any on the top of the soil at all; but this doctrine will not stand the test of experience, and we must, therefore, conclude that such appendages are only necessary to keep the floor of the room dry and clean. Succulent plants, such as

Cacti, would be much injured, and probably rotted by being kept continually standing in water; and, therefore, although pans may be placed below the pots for the purposes above-mentioned, water should not be allowed to stand in them for any length of time.

Ladies who have a quantity of window plants, should now have a stage, and place the most of them out of doors. If the outside of the window or balcony is not too much exposed to the midday sun, they will do very well there; but on the south side of houses, where the heat is so great from reflection, the plants get burned, and in a short time look very unsightly; in such situation, Mammillárias and other Cacti are at home and flourish. Many of these plants are very well suited for rooms, particularly the pretty round Mammillárias, which are at all times curious, and when in flower extremely neat and handsome, although the flowers are small. There is another plant, known as the "Creeping Cereus," which is well suited for a window with a south aspect. There was a beautiful specimen of this shown at the last garden exhibition of the Horticultural Society. It is grown during the greater part of the year in a window at Turnham Green, and sometimes in summer taken out and placed upon the top of an old wall.—*R. F.*

Erratum.—At page 332, col. 1, read, "loosen the ground well all round the plant," instead of "soak the ground," &c.

HOME CORRESPONDENCE.

On Raising Tropical Seeds.—Much of the disappointment in raising seeds is occasioned either by the access of light, by deep covering, by too much or too little moisture, or by insufficient heat. Many plants will grow well at a temperature quite incompetent to promote and sustain the germination of their seeds; for instance, the Kidney Bean (Phaseolus) can during a cold wet summer only be cultivated in Britain by starting the seed in a hotbed. The well-known difficulty in causing imported Cocoa-nuts to germinate may arise from insufficient heat, or from the fruit having become dry by remaining too long on the tree. The liquid contained in the nut is indispensable in the process of germination, as the food of the embryo can only be absorbed in a liquid state. Although the Cocoa-nut is cultivated in the mountainous parts of Jamaica, where the atmospheric temperature varies from 60° to 90°, it only assumes the characteristic grandeur of Palms, and can only be propagated with certainty, by the seaside, where the heat of the soil exceeds 120°. From what has come under my own limited observation, I think it may safely be laid down as a rule, in sowing tropical seeds, that, how well soever a plant may grow at the minimum temperature of its native locality, the maximum temperature of that spot ought to be maintained while the seeds are vegetating. The chemical effect of light, so injurious to small seeds, such as Lisianthus, Lobélia, &c., could easily be obviated by having sashes glazed with coloured glass. Larger seeds, however, that admit of being covered to the depth of half an inch, do not require such protection when sown in March. If the atmospheric temperature and humidity of the locality of every plant were better known, the proper mode of cultivating exotics would be more readily predetermined. Many individuals resident in foreign countries are deterred from collecting seeds and plants from inability to name them, while others think they have greatly enhanced their value by noting their Linnean class and order. But I presume the information most desirable to accompany a package (suppose from Jamaica), is to know whether a given plant grows by the seaside, or towards the summit of the Blue Mountains, where the temperature varies from 40° to 75°; whether in the partial light of a deep dell, or exposed to the direct rays of the sun in the open glade; or whether an annual, a lowly shrub, or a lofty tree. Such information might be communicated by any one. The most useful and interesting part of geography is the distribution of plants, as they are dependent in a greater degree on external agents, such as heat and light, than animals.—*Thomas Cowan.*

Curling of the Leaves of Peach-Trees.—A correspondent, on the authority of Mr. Hayward's Treatise, states that the author does not believe the curl in Peach-trees to be caused by cold winds, because all trees, growing in the same situation, are not affected by it. This only proves that some sorts are hardier than others. I have a Murray Nectarine this year blistered all over; adjoining to it is a Peach, that has hardly a curled leaf. The Nectarine was planted in light turfy soil, has had its roots raised more than once, and the same sort of soil added, but never a barrowful of dung amongst it; nor has the border had any dug into it opposite that tree for two years. Last April, I applied a little and planted a bed of giant stocks on the place, which remained till last Christmas, when they were pulled up, and the spot has neither been dunged nor cropped since; so that a surfeit of putrescent matter is not the cause in this case. I have some fine trees growing in a more sheltered situation, which are scarcely touched by this disease, although the soil is a perfect bog.—*J. M., Cley Hall.*

Rust on Grapes.—Having a small vinery, managed entirely by myself, which for some years has produced fine fruit, although shanking to some extent has now and then injured the Black Hamburghs, I was induced last year, as the house is heated by a brick flue, to place upon it a zinc pan, 4 feet long by 6 inches wide and 3 deep, for the purpose of creating moisture, which I was led to suppose from various writers, would prove highly beneficial to the health of the Vines. But although they certainly have shown greater vigour I have been visited with a disease which I had never witnessed before, namely, "Rust." This has only shown itself upon the Black Hambro; a Tokay and Sweet Water, on each side, have no appearance of it. This disease is uniformly stated to arise from the handling of the Grapes in thinning, or from being rubbed by the hair of the operator. My Grapes, I can confidently state, have never come in contact with anything, and it made its appearance soon after they were set. The true cause I believe to be the deep planting of this Vine, which is now 15 years old. I was not an amateur gardener at that time, and knew little about planting. But having determined to discover, if possible, the true cause of shanking, I last year opened the border and searched for the roots of one of the Black Hambro Vines, which had always shanked. I found them buried 2 feet, the main root had never entered the border, but had gone round the corner of the house, under the water tub, and buried itself in a strong clayey soil. This I have no doubt caused the disease. I have shortened the roots, cut it down and planted it 8 inches deep, and the Vine is now growing, not very strong, certainly, but it looks healthy. The Tokay and the Sweet Water I planted myself in the same border, and they have never shown any diseases. I am left to suppose, therefore, that both these diseases arose from the same cause, namely, deep planting and a bad border. But how to account for the appearance of this rust only within the last two years, I cannot surmise, and if you can suggest any remedy, you would greatly oblige me.—*J. Deane Waite.* [We really cannot suggest any reason for the appearance of the disease in this instance; if any of our Correspondents can, they will greatly oblige us.]

Bleeding of the Vine.—I have been amused by the fight about the cheese, for this purpose, in your late Numbers. If your correspondents will study a work, which I will recommend to them if you will not, "Lindley's Theory of Horticulture," they will find at page 257 to whom the discovery belongs.—*Surreyensis.*

Hellebore Powder and Gooseberries.—It may save expense and disappointment to some of your readers to state the result of an experiment I made on the Gooseberry Caterpillars with powdered hellebore, which is so strongly recommended for their destruction. I covered several of the larvæ completely with the powder, and confined them under a wine-glass, on a piece of paper strewed with hellebore. I watched them for several hours, during which they seemed to experience no inconvenience whatever; at the end of 20 hours they were alive, though very languid; but perhaps not more so than if they had simply been kept for that period without food. In this experiment the powder was applied much more completely than it would be possible to do on a bush. My inference from it is, that hellebore is useless. I have kept the caterpillar well under by hand-picking the bushes by children,—repeating it when necessary.—*Surreyensis.*

Strawberries and Broccoli.—In a late Number of the *Gardeners' Chronicle*, Mr. Gordon has given an ample description of the different sorts of Broccoli and their treatment. For several years I have been in the habit of planting Strawberries along with late or spring Broccoli. The sorts I generally plant are Keen's Seedling, Roseberry, Grove-end Scarlet, Old Scarlet, and Aberdeen seedling: I prefer planting either after Celery when the ground has been bastard-trenched with a good coat of manure dug into the bottom spit; or after any kind of roots when the ground has been well manured and ridged in the autumn, and dug previously to planting. I put in the rows of Broccoli from two feet to two feet and a half apart, and the same distance in the rows, according to the size of the sort; I then draw a shallow drill in the centre between each two rows of Broccoli, and plant the Strawberries in it one foot apart. If the weather should be dry after planting, I water them two or three times until they take root, keep down weeds, and occasionally clear away all dead or decaying leaves of the Broccoli; and in the spring the Strawberry plants will be equally as strong as those growing in a similar situation by themselves, and come into flower some days before them, owing to the shelter they receive from the Broccoli in the spring, which of course will be gradually thinned out as they become fit for use; and by the time that the Strawberries are in flower the Broccoli is all cleared away. I am no great-advocate for huddling different sorts of crops together, but the above plan I have practised with considerable advantage, and I find that it economises ground, time, and labour.—*James Alexander, Carton Gardens.*

Mills' Improved Pits.—I have lately had constructed one of Mills' improved pits, which has astonished all the gardeners about here from the quickness of the growth and gigantic foliage of the Cucumber plants grown in it. The sort was Weedon's Black Spine. These were planted one under each light, and the first fruit cut on the 10th of April; from which period till the present time, May 23rd, they have continued in full bearing, and have produced 33 fine Cucumbers, varying from 14 to 18 inches in length. There are now nineteen in the pit, which consists of three lights, at different stages of their growth. The soil used consists of three parts peat from Patmore Heath, and one part leaf-mould, with a small portion of yellow loam. The depth of soil was eighteen inches, and this was laid upon a sub-stratum of faggots. The foliage is of a very dark green colour, and the dimensions of a leaf measured May 18th were twenty-one inches by fifteen.—*T. Hoblyn, White Barns, Buntingford.*

Tropæolum Edule.—As it appears, from a letter I have received from Messrs. Low, of Clapton, that the specimen of the plant exhibited by me at a meeting of the Horticultural Society, on the 2d inst., is identical with their plants, I request you, in justice to them, to correct an error into which I unguardedly fell, in having stated, in my former communication, that their Tropæolums were an inferior variety. I regret that I should have been led to make an observation which might, as Messrs. Low think, prove injurious to them if allowed to pass uncontradicted; and I have written to them to give the name of the individual from whom my information was derived.—*F. Coventry, Jersey.* [It was impossible for us to tell whether the plant of Messrs. Low was the same as Mr. Coventry's or not, having only seen a few flowers of the former. Those flowers were apparently the same as what we find upon the wild specimens of Tropæolum polyphyllum, but the foliage is quite different; so that the true Tr. polyphyllum, a very fine plant, still remains to be introduced. Let us hope that it will arrive in company with Tr. azureum, the blue-flowered sort, whose colour is that of the Siberian Larkspur, and which it appears that Mr. Bridges has found.]

Chamomile.—I have no doubt Chamomile is a restorative to many sickly plants: I am much mistaken, indeed, if I have not satisfactorily proved the fact. In therapeutics, however, as applied to plants, modern research has contributed nothing worth recording.—*J. Murray.* [If this be so, where is the evidence?]

Formation of a Lawn.—Having observed in the *Gardeners' Chronicle* of the 7th of May that a correspondent, L. M. N., had requested information upon turning a piece of waste ground into a lawn:—I submit the following method, which I adopted in turfing about 200 square yards of garden ground, if you should think it worthy of notice. I was too impatient to wait for a decent sward by the slow process of seed-sowing, and too poor to give 3*d.* a yard for turf, and the carriage of two miles more afterwards to get it home; so I obtained a few barrow-loads of pretty fine turf, from some green patches at the sides of a lane, and my ground being prepared, I planted it all over: i. e., I took a piece of turf in my hands, (I am not a gardener, but a schoolmaster,) and tore off small tufts, and tossed them down (grass upwards, of course) at little distances from each other; dotting the ground, as it were, pretty thickly all over, and stepping backward as my work proceeded. When a space was done, I beat the tufts, level as I went on, by which they were spread out and pressed into the mould, which gave it at once a lawn-like appearance; and as I did this in the autumn, the patches branched out, and nearly filled up the intervals the first year. The above was an experiment of my own; "Mater artium est necessitas." It is now three years since, and the lawn is quite as good as if I had covered it at first with solid turf. I made no measured calculation of the proportion used, but I should say that 1 yard of turf would be quite sufficient to plant 4 yards of ground; and I could do it in less time than I could lay down that quantity of regular turf.—*O. P. Q.* [This is an account of the old practice of inoculation, which is not so generally known as it deserves to be.]

The Treatment of Shrubberies.—In a recent Number you advocated the propriety of leaving on the ground of shrubberies the leaves of trees, as neither unsightly nor altogether useless. Approving entirely of your line of argument, I was led to consider it as applicable to an object I have long been desirous of effecting, viz., an economy of the labour of keeping extensive shrubberies free from weeds, grass, &c. The expense of this, putting out of view its impoverishing effects on the soil, is very considerable, particularly in seasons such as we have of late experienced. The experiment, so far as I have tried it, has answered my expectation. It consisted in spreading the leaves equably over the ground, and sprinkling some earth over them to keep them down. I am now using, instead of earth, the short cuttings of mown grass, which, when strewed very thinly over the leaves, have the effect of bringing them together, and forming a sort of network, which observation has shown me to be of a very enduring character. It is evident the effect in favour of the growth of the plants is considerable. After more experience, I may perhaps communicate the results, economically considered; in the mean time I mention it, in the hope that you will give your attention to the subject, and that others may be induced also to experiment upon it. When extensive shrubberies are planted, I think it would be advisable to arrange the plants in quincunx fashion, so as the ground may be cleared by a horse-hoe for a few years, and then the leaves applied as the plants approach in their foliage. I find the application of the horse-hoe, with a small harrow attached to it, to be most economical in the clearing garden gravelled-walks, as well as approach-roads, &c.—*D. B.*

Railroads.—Being a good deal in the habit of travelling on railroads, it has often occurred to me to consider how easily their sides (of embankments as well as cuttings) might be embellished by the growth of ornamental plants, flowers, &c. Something in this way has indeed been done on the Liverpool and Manchester, and perhaps elsewhere; but nothing to any extent. On the line referred to, trees have been planted, which are decidedly objectionable, as they will require to be eradicated so soon as they acquire any growth. In the present depressed state of these undertakings, it may not perhaps be easy to induce their directors to take any step in this direction; but there are some exceptions to the general rule, and I should be very glad if you could bring your weight of authority to bear on these. As shrubs and flowers only are applicable, the difficulty is to know which are best adapted to the circumstances of the case, which are, generally speaking, very unfavourable, particularly as regards soil. I know, however, of at least one railroad, the directors of which would be glad of advice from you on the subject. Putting out of view the possible benefit derivable from the attraction a well-ornamented line might afford, I think, if strict economy were observed in the procuring and insertion of plants, the thing might be made to pay, at all events, for the expense. The collection and distribution of Digitalis seeds alone would do something; seeds of Scotch and other Roses, of Ribes sanguineum, are easily procurable;

and for shelter, cuttings of the common Elder, if inserted, would grow almost anywhere. Honeysuckle plants may be had from the woods; and if planted at the foot of cuttings where the soil descends and accumulates, would, if mixed with Irish Ivy, Ayrshire Roses, &c., soon cover the slope to the top. Even Fuchsias, propagated in the wholesale manner, might be extensively and successfully made use of. By way of experiment, I cut down a hedge of Fuchsias last autumn, tied the sticks in bundles, and placed them (the lower ends earthed) under the shelter of some Laurels. In the spring the lower ends were found well rooted; and the whole being cut down into lengths, were already plants of very promising growth. In this way, this ornamental plant, and, I am persuaded, many others also, may be produced at a cost not exceeding 5*s.* per 1,000. Partridges, it is found, are fond of breeding on the sides of railroads, where any shelter is afforded; probably because vermin are there in less numbers. Conterminous proprietors would, I doubt not, if applied to, contribute their aid.—*D. B.*

Bees and their Honey.—Dr. Bevan, in his work on the "Honey Bee," ascribes the peculiar flavour of the Narbonne Honey to the flowers of the Rosemary. I have always understood it entirely ascribable to the Orange blossoms; and, to my individual judgment, the latter opinion is well founded. He has ascribed the principles of deleterious Honey to extracts by the Bees from the Kálmia latifólia, one of those mentioned by Dr. Barton; as well as K. angustifólia and hirsuta, together with Andrómeda mariana, Rhododendron máximum, and Azálea nudiflora. As to the Rhododendron, the inference seems to me altogether questionable. In the flower of the Rhododendron ponticum may be sometimes found a crystallised sugar, certainly not poisonous; and the late Mr. Whittaker, a son of the historian of Craven, who had been long in India, informed me that among the Himalaya mountains, where there were entire forests of Rhododendrons, the stocks of Bees were extremely numerous, and the Honey entirely innoxious. Dr. Barton has not mentioned the Ledum, a plant fatal to many insects, and no doubt it would administer a noxious ingredient to Honey. —*J. Murray.* [The poisonous honey of the Euxine is certainly prepared from Azalea pontica; and Rhododendron ponticum itself is undoubtedly a poisonous plant; hares will not touch its shoots.]

Cockroaches.—No person who can procure a live hedgehog need either be troubled with Cockroaches, or resort to the hazardous expedient of strewing poison about his premises. I can affirm this from experience.—*A. Herbert.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

May 20th.—Mr. Solly introduced his fourth lecture by stating that the next question for his consideration was one of great importance. Plants are found to consist of lignine, gum, sugar, starch, &c; the question is, whence do they procure these substances, all of which are composed of oxygen, hydrogen, carbon, and nitrogen? in short, what is the food of plants? If we examine the natural conditions under which plants grow, we find their roots in the soil, and their stem, branches, and leaves in the air; do they get their food from the soil, or from the air, or from both? The air consists of oxygen and nitrogen mixed together, but it contains also moisture, which it takes up from rivers, lakes, &c.; it also contains small traces of carbonic acid and of ammonia; the former derived from numerous sources, such as combustion and respiration—the latter from the decomposition of all organic substances containing nitrogen. Hence the air alone contains the four elements of plants. The soil is a far more complicated mixture, consisting of numerous earthy and saline substances, containing also, like the air, carbonic acid, ammonia, and moisture. The bulk of soil consists of silica, alumina, and a little oxide of iron, together with various small proportions of carbonates, sulphates, nitrates, phosphates of lime, magnesia, potash, soda, ammonia, and many other salts. In addition to these, all soils contain a little decaying organic matter, of both vegetable and animal origin. It is thus plain that the soil contains also much of the food of plants. Vegetables grow by decomposing (under the influence of light) the carbonic acid, water, and ammonia, which they absorb from the air and soil. Much has been said and written respecting the manner in which they absorb or assimilate these substances. According to Liebig, plants can only acquire carbon by decomposing carbonic acid; others, on the contrary, think that, although this is the principal source of carbon, yet that plants may likewise sometimes absorb organic matter from the soil directly, and thus acquire carbon otherwise than by decomposing carbonic acid. Whichever way the question is considered, it is notorious that the soil exerts a very considerable influence upon the growth of plants; and there can be no doubt that it acts partly by providing organic matter, consisting of carbon, hydrogen, nitrogen, and oxygen, and partly by supplying a small quantity of saline and earthy matters. As on former occasions, many well-selected experiments were introduced, among which one connected with the fluid state of flints attracted great attention.

May 24.—W. H. Pepys, Esq., in the Chair. The Earl of Harewood, Sir H. Meux, Bart., Sir H. P. Hume Campbell, Bart., G. Phillips, Esq., C. Puller, Esq., Mr. Alex. Couper, and Mr. J. E. Lane, were elected fellows, and Dr. J. C. Featherstone, of the Hort. Soc. of New Zealand, and J. Travers, Esq., of Philadelphia, foreign corresponding members. Notwithstanding the recent occurrence of the exhibition at the garden, there were many rare and beautiful specimens present. A large collection of plants, chiefly Orchidaceous, was sent by Mrs. Lawrence, containing 2 varieties of the superb Cattleya Móssiæ the colours of one of these were far brighter and better defined than those of the other; a species of Epidendrum, with singular brown flowers and a white labellum; Aérides affine, with a gracefully drooping raceme of lilac and purple blossoms; Maxillária tetragona; a pretty red-flowering species of Stylídium; a variety of Gompholóbium, called intermedium, from Swan River, with rather handsome reddish and yellow flowers, supposed to be one of the species of this genus whose poisonous properties have occasioned the destruction of so many cattle in the Swan River Colony; and Echium giganteum, producing a dense spike of white flowers above two feet in height. A Banksian medal was awarded for the dark variety of Cattleya Móssiæ and Aérides affine. From H. Story, Esq. a collection of seedling Heaths, raised between Erica ventricosa and E. aristata; these were exceedingly beautiful, and in excellent health, particularly E. ventricosa rósea, of a bright rose, with larger flowers than the generality of this subdivision of Heaths; ventricosa coruscans, of a purplish carmine before expansion, and gradually changing to light pink; ventricosa purpurascens, of a delicate flesh colour, both flowers and leaves being covered with a dense pubescence; fasciculata longiflora, a remarkably free bloomer; and conspicua, a peculiarly bushy, close-growing variety. For these a Knightian medal was given. From J. Allnutt, Esq., a small plant of Azálea fulgens, with larger and more brilliant flowers than any variety hitherto raised. A certificate was awarded for this. From Messrs. Chandler a fine plant of the sweet-scented Rhododendron fragrans. From C. B. Warner, Esq. a species of Habranthus, from South Chili, of a rosy lilac colour. From Mr. Gaines, of Battersea, a seedling Pelargonium, called the Princess Royal. From Messrs. Veitch cut flowers of their new Manéttia bícolor, Stigmatophyllon aristatum, Begonia coccínea of a bright scarlet colour, and Gloxínia speciosa, var. macrophylla variegata. From Mr. Cowan, gr. to M. Foster, Esq., a seedling Pelargonium. From Mr. Ferguson, gr. to the Duke of Buckingham, some green-fleshed Melons, and fine Black Hamburgh Grapes. The Vine from which these were cut was raised from the one at Hampton Court. It consists of 7 branches, each of which is 8 feet in length: in 1840 it produced 163 bunches; in 1841, 154; and in 1842, 141; total, 458 bunches. A certificate was awarded for the Grapes. From Mr. Henderson, of Coleorton Gardens, some exceedingly fine Peaches and Nectarines, for which a Banksian medal was given. From Mr. Dodemeade, gr. to W. Leaf, Esq. a basket of excellent Mushrooms. There was from the garden of the Society a large collection of Orchidaceous and other plants; amongst them were three species of Stanhópea, namely, tigrina, oculata, and saccata; the beautiful Dendróbium moschatum, a new species of Peristéria, with a white perianth, and and the labellum covered with purplish brown spots; Leschenáultia bíloba, a beautiful greenhouse shrub, with lovely blue flowers; Campánula grandis, a hardy herbaceous plant, with leaves resembling those of the Peach, and blossoms of dark blue—this was received by the society from St. Petersburg about two years since; Hotéia japónica, a pretty plant, somewhat resembling the common Meadow Sweet, and which will probably prove hardy; cut flowers of Pentstemon crassifólius, a very hardy, free-flowering kind, from the N.W. coast of America; and specimens of the purple Laburnum, exhibiting the lusus naturæ of three different sorts of flowers growing upon one branch. This kind is said to have been raised from a cross between the common yellow Laburnum and Cytisus purpúreus. The branch, in the present instance, appeared as if endeavouring to throw off its metamorphosed character and reassume the appearance of its original parents. There was also a Hyacinth which had been growing in a dark cellar, and although totally excluded from the light, its flowers had expanded of their natural red colour, whereas the leaves and stem were quite blanched. This fact is at variance with the established views of physiologists; since the colour of the flowers, in the present case, could not have been produced by the action of light.

May 27th.—Mr. Solly's fifth lecture was delivered to-day. It was mentioned in the last lecture that plants take up earthy substances. This is quite independent of the assimilation of oxygen hydrogen, carbon, and nitrogen, and is of considerable importance. In studying the phenomena connected with it, several questions arise, to many of which, in the present state of science, answers altogether satisfactory cannot be given. When we examine the ashes of plants, we find out what earthy substances they have taken up; they prove to be potash and alkaline salts—always lime, sometimes silica or flint, very often phosphoric acid. So that we are forced to the conclusion that these substances, though quite independent of the "food of plants," are as essential to their growth as carbonic acid, &c. Mr. Solly then traced the life of a plant through its various stages—firstly, of *Germination:* Water, heat, and air are necessary to the excitement of the vitality of a seed; then its effects are—first, mechanical, swelling or softening the parts; second—chemical, the carbon in the seed being diminished; hence carbonic acid is formed during germination. The use of the substance called albumen was stated to be to feed the embryo plant till roots are formed. The influence of light in retarding germination was pointed out, as also the fact, that the vitality of seeds may be equally destroyed by too high or too low a temperature. Secondly, *of the formation of young leaves:* When the young plant begins to feed itself, and to assimilate its food, the circumstances connected with it are altered; no carbonic acid is evolved—light is then required: this leads to a consideration of the perspiration of plants, the nature of their sap, and the change it undergoes in the leaves; consequent upon which is the formation of woody tissue. The influence of light, heat, moisture, and a variety of other causes over these functions of plants, were then discussed, together with the effects of plants in keeping up the purity of the air, which is one of the great offices of vegetation. Thirdly, of *flowers* —their effects on the air. These were pointed out, and some observations were offered on their colours, the strange diversity of which all proceed out of four colourless elements. These colours were shown to be affected by acids and alkalies, and also greatly by light. Fourthly, the *fruit and seed.*—Here was pointed out the way in which they appropriate the juices of the plant, and the supreme importance of light and heat in enabling them to do so. The great variety of organic secretions, sweet, sour, oily, resinous, &c., were shown to depend on simple chemical rules. Lastly, the chemical considerations connected with the *death* of plants were explained; its effects upon their fabric; and the final results which arise out of their decay.

Horticultural Society's Exhibition.—Owing to some mistake in the entry of my plants which were exhibited at the Chiswick gardens, on the 14th May, all my single specimens, in some cases unique, were overlooked by the judges and no account taken of them, either in the award of the prizes or the report of the show in the *Chronicle* of last Saturday. I think, after such an omission, it will be but just to state that they were as follows:—Erica pinifolia, very rare; E. depressa, large, in full bloom; Gompholobium Hendersonii, new; Medinilla erythrophylla, new; Epacris lævigata, new; Boronia ànemonefolia, new; Platylobium Murrayanum, rare; Eriostemon neriifolium, 7 feet high; Chorizema varium, 6 feet across. By reporting the above, you will greatly oblige me and my employers: *Joseph Goode, gardener to Mrs. Lawrence, Ealing Park.* [Mr. Goode should have added that the "mistake" he alludes to was his own; and that his mistress's plants were overlooked in consequence of his having neglected to enter their names. If exhibitors will not attend to their plants, and take care that they are properly registered and marked, we do not know how such "mistakes" are to be prevented.]

ERRATUM.—In the *Chronicle* of Saturday last, I find, in the report of the grand horticultural exhibition at Chiswick, an error, which I trust you will set right. It says, "Mr. Pontey's seedlings were seen under great disadvantages: the distance they had to travel had no doubt caused the petals to flag and reflex. One called the Duke of Cornwall, a flower of extraordinary brilliancy of colour, we trust to see again under more favourable circumstances."—I cannot imagine how the mistake could have occurred. However, they were Mr. Lyne's seedlings, of Lipson, forwarded by me, and exhibited by Mr. Smith, my agent in London.—*William E. Rendle, Union-road Nursery, Plymouth.*

LINNEAN SOCIETY.

Anniversary, May 24th.—Bishop of Norwich in the chair.

The Secretary read the bye-laws relating to the election of officers. The ballot was then commenced and the following officers elected:—

President—Edward, Lord Bishop of Norwich, D.D.
Treasurer—E. Forster, Esq.
Secretary—J. J. Bennett, Esq.
Under-Secretary—R. Taylor, Esq.

Members of Council Removed.	*Members of Council Elected.*
A. B. Lambert, Esq.	Lord Beverley.
G. Mantell, Esq., LL.D.	J. A. Hankey, Esq.
The Marquess of Northampton.	J. Miers, Esq.
R. H. Solly, Esq.	R. I. Murchison, Esq.
W. Yarrell, Esq.	A. White, Esq.

Specimens of the bark of the Cinnamon, of an unusual length, were exhibited, presented to the Society by the Hon. Henry Wright, of the Ceylon Civil Service. Mr. Miers read the Treasurer's accounts, by which it appeared that the receipts during the past year were 785*l.* 10*s.* 10*d.*; the expenditure, 761*l.* 17*s.* 5*d.*; leaving a balance of 23*l.* 13*s.* 5*d.* in the Treasurer's hands. The following statement was then read by the Secretary:

"The Council having had under their serious consideration the financial affairs of the Society, submit the following statement to the Fellows at large. The cost of the Collections and Library of Linnæus, together with those of the first President, Sir James Edward Smith, purchased of the executors of the latter in 1828, amounted to 3,000*l.* Of this sum about 1,500*l.* were then raised by subscription; and to meet the remainder a debt, on bonds, was incurred, which now amounts to 1,300*l.*, paying interest at 5 per cent. In consequence partly of this amount of interest, and partly of a diminution in the annual receipts, there has been accumulated within the last few years a further debt of about 500*l.* By recent arrangements a saving of some amount has been effected in the expenditure; but the Council are convinced that no further material reduction can be made without greatly impairing the efficiency of the Society, and they desire to avoid, as far as possible, the necessity of calling upon the Fellows to agree to a small charge being placed upon the Society's publications, that appearing to be the most obvious means of supplying the deficiency in the annual receipts. With this view they propose a general subscription, which they trust may reach such an amount as to meet the present liabilities, and to relieve the funds of the Society from the burthen of debt and interest. They, therefore, earnestly recommend the subscription to the members of the Society." To this document, which was circulated in the room, is appended the names of subscribers to the amount of about 600*l.* During the past year the following Members have died:—J. Ansley, Sir W. Beatty, Sir Chas. Bell, Rev. Isaac Bell, J. E. Bowman, Rev. Thos. Butt, M.A.; W. Cattley; E. J. Clarke, M.D.; Geo. Coles, R. Goolden, W. Harrison, Robert Higgin, Philip Hurd; J. R. Johnson, M.D.; A. B. Lambert, Charles Lane, Richard Leigh, Robert Maughan, Archibald Menzies, David Pennant. Of foreign members: Auguste Pyrame De Candolle, and Gens Wilken Hornemann. Of Associates, the Rev. R. F. Bree, Professor Don, and Mr. C. E. Sowerby. Notices of the life and labours of many of the above Fellows were then read by the Secretary. The President announced that Part I. Vol. XIX. of the Society's Transactions was now ready for distribution.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

May 21.—The anniversary meeting was held at the Society's house in Hanover-square, H. Handley, Esq., President, in the chair. The following report of the Council was read:—Four years only have elapsed since the foundation of the English Agricultural Society, and two only from the date of its incorporation to the present time. In that short period it has laid the firm foundations of its future progress; and although the accomplishment of its objects can only be the result of a more extended sphere of its labours, the influence of its example has tended to clear away those local prejudices in farming which from time immemorial had proved fatal obstacles to improvement, and has excited a candid spirit of inquiry on every subject connected with the good of the country and the interests of its members. At the last general meeting, the council announced their intention to apply to her Majesty's Chief Commissioner of Woods and Forests, for ground on which to erect in London a complete establishment for local purposes; and Viscount Duncannon not only placed at their acceptance a suitable space of Crown land in the neighbourhood of St. Martin's lane, but Mr. Dean also favoured them with plans for the construction of the edifice. These proposals received the consideration of the house committee, and the council on receiving their report resolved to abandon that design, on the grounds of the almost ruinous outlay of capital required for its accomplishment, and the local advantages only which would be attained by the undertaking; while the general interests of the society would be injured by the financial embarrassment resulting from its adoption. They therefore concurred in the recommendation of the house committee, that a suitable house should be selected for the purposes of official business, in which accommodation could be obtained for the secretary's office, the meetings of the councils and committees, and the general meetings; and in which a library for the reception of works of reference, and the most recent English and foreign publications on agricultural subjects, could daily be consulted by the members. All these advantages have been fully attained in the present house. The finance committee have reported the steady funding effected of the life compositions of Governors and Members, and have announced the great advantages attending the transmission of subscriptions from the country by means of post-office orders. They have also presented the several balance sheets of accounts as examined and approved by the auditors, together with the general ledger of accounts, in which the various receipts and payments will be found entered, and the following statement of the members, no less than 500 new ones having been elected during the last six months:

Life Governors	101
Governors	211
Life Members	328
Members	5,194
	5,834

The journal committee have reported that the whole of the new part is now printed, and on the point of publication. The council find that 2,000 impressions of Mr. Main's article, on Cottage Gardening, printed for cheap distribution (at 1*d.* each copy), have been distributed; and that Mr. Burke has furnished to the journal a compilation on "Cottage Economy and Cookery," which will be also reprinted in a cheap form for distribution among cottagers. The general Bristol committee have reported the near completion of their arrangements, and the rapid progress made by Mr. Manning, in the erection of the pavilion and show-yard, agreeably with the plans of Sir Robert Smirke and Mr. Dean. They have also accepted the offer made to them by the committee, of the Victoria Rooms, of the whole of that large and commodious building during the period of the meeting. The council have decided that the annual country meeting of 1843 for the north-eastern district shall be held at Derby. They have enacted an important by-law for regulating the elections at the anniversary meeting, and facilitating the mode by which members may record their votes on that occasion, in reference to the election of those members whom they may elect to fill the vacancies in the council annually created by the terms of the charter. The society are indebted to her Majesty's Office of Woods and Forests, in receiving every attention in the institution of experiments by Mr. Griffiths, at the King William's Town Experimental Farm in Ireland, on the comparative dairy value of Scotch and Irish cows; and a communication from the Earl of Lincoln, expressing his willingness to direct a complete analysis of the soils of the kingdom, to be undertaken at the Museum of Economic Geology at the expense of the Government. From Mr. Shaw Lefevre also, on the part of the Board of Trade, they have received a communication, expressing an intention to transmit a notice of any important agricultural implements which may be sent from abroad. The council have to record their sense of Dr. Daubeny's liberality in undertaking a journey into Spain, for the purpose of ascertaining the circumstances and extent, in the district of Estramadura, of the geological formation or mineral vein of phosphorite, or native phosphate of lime; a substance which holds out the prospect of becoming, to a certain extent, a substitute for the earthy part of bones, and probably, by judicious combination with gelatinous matter, a substitute for bones themselves, as a manure for land. They, finally, have the pleasure of announcing, that they have placed the Agricultural Society of Newfoundland among the number of the corresponding societies, and have taken advantage of the probable visit to this country of Dr. Liebig, and of Mr. H. Colman, Commissioner for the Agricultural Survey of the State of Massachusetts, to enrol their names in the list of honorary members. The Earl of Hardwicke was proposed as President by the Duke of Richmond, seconded by J. Webb, Esq., and elected unanimously.

BOTANICAL SOCIETY OF LONDON.

May 20th.—J. E. Gray, Esq., President, in the chair. The following donations were announced: A specimen of Sugar-cane from Madeira, presented by Mr. J. Halley; a specimen of Bupleurum tenuissimum, found at Highgate, by Mr. Mitten; British Plants, from Mr. E. Lees, Mr. G. H. K. Thwaites, and Mr. J. Ellis; and books from the President. A paper was read from E. Lees, Esq., "On the Flora of the Malvern Hills, Part 3; being a Sketch of the Cryptogamic Vegetation indigenous to the chain." This was accompanied by specimens, many of which were exhibited; the author considered that nearly one-half of the plants occupying the Malvern Hills were Cryptogamic; and the following synopsis will show this to be not an unreasonable supposition, especially as the census which the author had taken is not to be considered a perfect one; embracing, however, all the species Mr. L. had been enabled to identify, after an attentive examination of upwards of five years:

	Species.
Ferns and Equisetaceæ	25
Mosses	121
Jungermanniæ	23
Other Hepaticæ, Characeæ, &c.,	15
Lichens	223
Fungi	305
Total	712

BOTANICAL SOCIETY OF EDINBURGH.

May 12.—The seventh meeting for the season was held at the Botanic Garden; Professor Christison in the chair. Miss J. Farquharson was elected a life member.—The following communications were read:—1. On "Fumaria parviflora," as a native of England, by Mr. C. C. Babington. Mr. Babington, in reference to an opinion formerly expressed by him, that this species was a very doubtful native of England, not having then seen any specimens agreeing with the true characters of it, now states that he has obtained satisfactory proofs of its being a native; but that most botanists have been in the habit of calling F. Vaillantii by that name. He says, however, that the flowers of English specimens of F. Vaillantii are decidedly smaller than those of some which he possesses, from Montpelier—and that in some white-flowered English specimens of the same plant he perceives traces of an apiculus; also, that in French specimens of F. parviflora the flowers are of the same size as those of F. Vaillantii, but the fruit has an apiculus. Mr. Babington then gave a minute description of the principal characters which distinguish this and other allied species of the genus.—2. On the occurrence of Gelidium rostratum, Harv., at Aberdeen. By Mr. G. Dickie. This remarkable plant, which Mr. Turner considers, though with hesitation, as a variety of Delesseria alata, but which Dr. Arnott and Mrs. Griffiths refer to Gelidium, Mr. Dickie states to be abundant at Aberdeen, though it has not hitherto been found *in situ*. It occurs on the large stems of Laminaria digitata, and appears to be an inhabitant of deep water, being only found cast up after storms. Mr. Dickie says, "After comparing numerous fresh specimens of G. rostratum and D. alata, I feel convinced that there is no essential difference in the structure and outward form of the fruit in these plants. In both, the ternate granules are terminal and axillary, and the capsules occupy the same position. The seeds, however, differ in form; those of D. alata are mostly oval, in the other they are spherical."—3. On some anomalies in form in Scolopendrium vulgare. By Mr. J. Dickson. The fronds exhibited presented every possible variety of shape, from lanceolate to reniform, and from entire to lobed, or rather digitate. The more usual form is certainly entire and oblongo-lancolate, and it is difficult to account for the freaks of form which not unfrequently occur in this species of Fern.

FLORICULTURAL SOCIETY.

THE second show for the exhibition of Tulips and Heartsease took place at the Crown and Anchor in the Strand on Tuesday, and to the lovers of these flowers a great treat was afforded. The display of Tulips was beautiful; the stands contained some remarkably fine blooms, and were filled with the choicest varieties that are cultivated in the neighbourhood of London. In the department of class-showing some superb specimens were exhibited; and we are happy to perceive that a renewed stimulus seems to animate the growers of this "queen of flowers;" for the display of new varieties was numerous and encouraging. The show of Heartsease was the best collection of this universal favourite we have ever seen. The flowers were in the greatest perfection, large in size and fine in colour. The exhibition was attractive, and appeared to afford general satisfaction. The following is a list of the prizes:—

TULIPS.—*Amateurs:* Mr. Goldham, Islington, 1st prize for the best 9 blooms; Polyphemus, Shakspeare, Coronation, Parregiano, Daphne, Louis 18th, Triomphe Royal, Rose Brillante, Groom's Duchess of Sutherland.—*Professional Florists:* Mr. Brown, Slough, 1st prize best 9; Polyphemus, Brown's Hamlet, Platoff, Duchess of Tuscany, Lavinia, Belle Actrice, Triomphe Royal, Georgius Tertius, Cerise à belle forme. Mr. Willmer, Sunbury, 2d prize; Platoff, Mellona, Priam, Violette Rougeatre, Triomphe de Lisle, Roi de Siam, Triomphe Royal, Cameuse de Croix, Perle Brillante. Mr. Norman, Woolwich, exhibited the following:—Polyphemus, Abercrombie, Surpasse Catafalque, Laurence's Friend, Desdemona, Lord Bloomfield, Cerise à belle forme, Triomphe Royal, Rose Quarto.

NEW TULIPS.—No. 1. 1st-class prize was awarded to a bizarre named Brown's Polyphemus. This is a magnificent flower, broken from a seedling of Mr. Brown's, of Slough. The cup is a fine form, and very large; the petals are thick, stiff, well rounded, and even on the edges; the ground is a bright unstained yellow clean to the bottom of the stamens, with a very deep and intensely dark feather; the stem is strong, and it appears to be a middle-row flower. This splendid Tulip excited general admiration; from its size, fine cup, deep and bright colour, it will form a distinguished addition to any collection. 2, 1st-class prize. The Queen, broken by Mr. Goldham, of Islington; a beautiful rose, distinguished for its pure ground, clear bottom, and the peculiarity of its flame. 1, 2nd-class prize. A Byblœmen called Goldham's Napoleon; short cupped flower, with broad flame, broken into colour somewhat in the style of Pandora. 2, 2nd-class prize. A bizarre, Mr. Norman, of Woolwich; a very neat and pretty flower, clean and decided in its breaking, with a well-formed cup. There were several other seedlings of merit exhibited; a particularly fine bizarre, but evidently a Polyphemus, and others, which were fine flowers, but excluded from prizes, in consequence of their being repetitions of varieties we already possess.

HEARTSEASE.—*Amateurs*, 24 blooms: 1st prize, Mr. Edmonds, Wandsworth Road; Russian Duke, Imogene, Page's Wellington, Grand Duke, Reliance Superb, Herbert, Edmonds' Freak seedling), Brown's Curion, Lady Peel, Una, Jewess, Yellow Defiance, Giantess, Jesse, Tippoo Saib, Eclipse, Delicata, Seedling, Duke of Devonshire, Beauty of Hitchin, Seedling, Miss Stainforth, Mulberry Superb, Robespierre. 2nd prize, Mr. Bridges, of Carshalton; Bridges' Commissioner, Vivid, Bridges' Lady Peel, Jewess, Page's Wellington, Grand Duke of Russia, Ealing Hero, Argo, Magnum Bonum, Lucy Ann, Eclipse, Curion, Henbrey's Alpha, Bridges' Carshalton Hero, Gibson's Pilot, Bridges' Sylvia, Ketley's Bathonia, British Queen, Bridges' Cream, Iver Champion, Henbrey's Pearl, Seedling, Great Western, Mountjoy's Queen. *Professional Florists*, 36 blooms: 1st prize, Mr. Mountjoy, Ealing; Ealing Hero, British Queen, Silverlock's Prince Albert, Dr. Lindley, Desirable, Peter Dick, Lane's Grand Duke, Col. Dundas, La Superbe, Miss Stainforth, Amulet, Imogene, Curion, Duchess of Richmond, Mountjoy's IV., Mountjoy's Cleopatra, Dark Perfection, Flora M'Donald, Jehu, Earl of Clarendon, Jewess, Delicata, Mountjoy's Sylvia, Thompson's Grand Duke, Brown's Countess of Orkney, Lewis's Coronation, Queen Dowager, Eclipse, Flora Superb, Thompson's Launcelot, Thompson's Prince Albert, Thompson's Ultra Flora, Beauty of Hitchin, Thompson's Azurea, Romulus, Beauty of Entree Hill. 2nd prize, Mr. Brown Slough; Cappel's Admirable, Rufus, Grand Turk, Azurea, Bathonia, Warrior, Flora Superb, Brown's Crœsus, Royal Standard, Delicata, Dr. Lindley, Superb White, Brown's Jon, Ruby, Eclipse, Jehu, Maid of Honour, Miss Stainforth, Brown's Countess of Orkney, Brown's Cremona, Miss Nugent, Triumph, Launcelot, Ultra Flora, Duchess of Richmond, Corona, Brown's Jewess, Cook's Perfection, Silverlock's Prince Albert, Desirable, Brilliant, Vivid, Thompson's Prince Albert, Mulberry Superb, Sulphurea elegans, Brown's Curion.—SEEDLINGS. 1841, 6 Blooms. 2nd class, Mr. Bridges of Carshalton, for Commissioner: 1842, 1 Bloom, 2nd class, Mr. Bridges of Hampton, for Martha; and Mr. King of Iver, for Princess Royal. A Seedling of 1841 was also exhibited by Mr. King, called Exquisite, and Seedlings of 1842, by Mr. Mountjoy, called Purpuréa; two by Mr. Edwards, named Freak & Mendham: one by Mr. Gaines, the name of which we could not ascertain. Mr. Hardy, of Cambridge, sent a box of Seedlings, several of which were very good, but they did not arrive in time for the judges, and even had they done so, they could not, according to the society's rules, have been accepted, not having been accompanied by the names intended to be given to them.

MISCELLANEOUS.

The Prangos.—One of the most valuable sources of fodder of Ladakh, or perhaps of any other country, is a plant known by the name of Prangos, which grows only in the western parts of the country, at Imbal or Dras. This occurs of various sizes, from a single leaf, covering not more than an inch of surface, to a cluster of leaves and flowers spreading to a circumference of 12 ft. or 18 ft. This bush consists of long feathering leaves, of a dark green, crowned, when in blossom, with a profusion of large tufts of yellow flowers; the leaves, when full-grown, are 2 ft. in length, and the bush is circular, with a rounded top. The flower-stems rise from to 2 ft. to 5 ft., or even 6 ft., in old plants. The root is perennial, the leaves and flower-stems are in life for about four months. The plant flowers in June, and at the end of August the seeds fall spontaneously, and sow themselves: they lie in the ground till the snow begins to melt, or till April, and the plant then makes its reappearance. It is not, however, till the third year that the root is fully developed and begins to spread; thenceforward it continues to put forth fresh shoots for an indefinite period, so that, in the belief of the peasantry, a plant scarcely ever dies. The head of the Prangos, including leaves, flowers, stems, and seeds, is converted into Hay, as winter forage for Goats, Sheep, and Cows. Late in August, or early in September, the plants are cut to within 2 in. or 3 in. of the ground, and laid out in bundles, kept down by heavy stones; these bundles are sufficiently dry in three or four days to be gathered and piled in layers on the house-tops. In the winter months about 1 cwt. is considered sufficient for 20 Sheep or 30 Lambs for 24 hours. Healthy Sheep, fed upon Prangos, are said to become fat in 20 days; and that, if fully fed upon it for two months, their fatness approaches to suffocation. It is also said to be of a heating quality, and displays its nutritive properties in Cows as well as in Sheep and Goats, but does not increase the quantity of milk; and as beef is not an article of food in Ladakh, there is no advantage in feeding neat cattle upon it. Horses thrive upon it, but they are not readily reconciled to it; and it is remarkable that, whilst growing, no animal will browse upon its leaves, although they will feed upon its flowers. It is only as Hay that it is an acceptable article of food. Considering its value as fodder, its growing in a poor sterile soil, in every variety of site, except actual swamp, and in a bleak, cold climate, and its flourishing wholly in independence upon the care and industry of man, it would seem probable that it might be introduced with national advantage into many parts of Britain, and would convert her heaths, downs, and highlands, into storehouses for the supply of innumerable flocks.—*Moorcroft's Travels*, vol. i., p. 288. [It seems impossible to bring the seeds of this plant to Europe in a live state. Many attempts have been made, but without any success.]

Luminous Plants.—The following account of some luminous Fungi found at Swan River, by Mr. J. Drummond, is given in "The London Journal of Botany:"—"They grow parasitically on the stumps of trees, and possess nothing remarkable in their appearance by day, but by night they emit a most curious light, such as I never saw described in any book. The first species in which I observed this property was about two inches across, and was growing in clusters on the stump of a Banksia tree, near the jetty, at Perth, Western Australia. The stump was at the time surrounded with water when I happened to be passing on a dark night, and was much surprised to see what appeared to be a light in such a spot; on examination, I found it to proceed from this Fungus. It is six or seven years since this circumstance occurred. The late Dr. Collie, then our Colonial Surgeon, possessed a good collection of botanical books, which he and I jointly consulted, but without finding anything which bore on the subject. When this Fungus was laid on a newspaper, it emitted by night a phosphorescent light, enabling us to read the words around it; and it continued to do so for several nights, with gradually decreasing intensity as the plant dried up. A few weeks ago, and not till then, I discovered another instance of the same kind. I was collecting plants on an ironstone hill in the Toodjay district, when I was struck with the beauty of a large Fungus, of the same character as the former, but measuring 16 inches across, and about a foot from the root to the extremity of the pileus. The specimen which I carried home weighed about five pounds, was very smooth, yellowish-brown above, and dirty-white upon the gills: it gradually became thinner towards the outer edge of the pileus, where it was waved and sinuated. It was the beauty of the species which induced me to gather it—for as to making a full collection of the Swan River Fungi, such a task would require an entire season, and the skill of a person who could make drawings or models of them. The specimen in question was hung up inside the chimney of our sitting-room to dry, and on passing through the apartment in the dark, I observed the Fungus giving out a most remarkable light, similar to what I have described above. No light is so white as this, at least none that I have ever seen. The luminous property continued, though gradually diminishing, for four or five nights, when it ceased, on the plant becoming dry. We called some of the natives, and showed them this Fungus, when emitting light; the room was dark, for the fire was very low and the candles extinguished, and the poor creatures cried out 'Chinga!' their name for a spirit, and seemed much afraid of it; and I certainly must own it is a very extraordinary Will-o'the-Wisp."

Improved Method of Managing Pigs.—In Hampshire, the condition of pigs has been much improved by cleanliness; it is the custom there frequently to wash and rub the skin with a hard brush. It is well known that the bacon of the above country will fetch two-pence per lb. more than any other, which arises from good management, and the practice now alluded to, as well as burning the pig, which gives the peculiar flavour. The plan of letting the pigs run about the streets and feed upon offal, fish, and filth, as is the case in sea-port towns, is unknown in the counties of Wilts and Hants.

Vegetable Weather Prophets.—The corollas of the Germander Speedwell are all securely closed at the approach of rain, and they as surely open again when the storm is overpast.

Not for thy azure tint, though bright,
Nor form so elegantly light,
I single thee, thou lovely flower,
From others of the sylvan bower,—
Thy name alone is like a spell,
And whispers Love, in "Speed thee Well."

The Pimpernel, also called most commonly "the Poor Man's Weather-glass," closes its tiny but brilliant flowers many hours before the occurrence of rain; its delicate flowers "go to sleep," or close up, soon after twelve, and again expand at seven in the morning. Thus, by this simple monitor, can we ascertain both the hour and also foretel the weather:—

Of humble growth, though brighter dyes,
But not by rural swains less prized,
  The trailing stems allure
Of Pimpernel; whose brilliant flower
Closes against the approaching shower,
Warning the swain to sheltering bower,
  From humid air secure."

The common and despised Dandelion, a word evidently a corruption of the French translation of the word, Dent de Lion, in German Pfaffenkohrlein and Dotterbluhme, is one of the most correct sun-dials, or rather, perhaps, "dial flowers;" closing at five in the afternoon, and opening again at seven in the morning.

Leontodons unfold
On the swart turf their ray-encircled gold;
With Sol's expanding beam the flowers unclose,
And rising Hesper lights them to repose.

If the Siberian Sowthistle shut at night, there will generally ensue fine weather on the next day; and if it open, cloudy and rainy. If the African Marigold remain shut after seven P. M., rain may be expected. If the Trefoil contract its leaves, thunder and heavy rain may be expected.—*Meteorological Journal.*

Sugar.—A letter from Athens, of the 28th March, mentions that the directors of the Royal Sugar Manufactory at Kaïnourio-Chorio, where, for some time past, beet-root sugar has been made, have just concluded some experiments on the root of the Asphodel, which grows naturally throughout the whole of Greece in great abundance. These experiments have been crowned with success. Not only is the sugar of admirable quality, but the quantity is six times greater than that furnished by the beet-root.—*Athenæum.*—[This plant is, we presume, the Asphodelus fistulosus. If the statement is correct, it will be a curious fact as regards the properties of plants, for no sugar has ever yet been found in any of the Liliaceous order.]

Royal Garden, Berlin.—At a meeting of the members of the Prussian Horticultural Society, held in October 1841, Herr Lenné, garden-director, gave an account of the improvements going on at Berlin, under the direction of the King, as well as of some others in contemplation, of which the following is an abstract:—1. The laying out of the Place de Belle-Alliance, in a similar manner to that at Leipsic, with convenient pleasure-grounds, &c.—2. An improvement and extension of the Park-grounds, in which it is proposed that the large waste parade be partly taken into the park, and planted in an ornamental manner. This is very desirable, as at present the dusty parade forms an unpleasant contrast with the agreeable grounds on its left, and in summer gives rise to clouds of dust, which cover the neighbouring vegetation. It will, when attached to the park, form a square, in the midst of which a place will be left for the parade, which is to be covered with a firmer soil than it is at present. The pheasantry, situated close to the park, will be converted partly into an extension of the park, and partly be occupied as a zoological garden. One of the greatest and most important ornaments of the park will be a memorial in marble, dedicated by the inhabitants of Berlin to King Frederick William III., and which, according to the direction of an order of the Cabinet, will be placed in the Flora-Platz, an arrangement which has given the highest satisfaction. A lithographic impression of the design for its erection was exhibited to the society.—3. Several alterations are proposed to be made, which will not only facilitate the industry and commerce of the inhabitants of *Berlin*, but involve improvements interesting to those engaged in horticulture and planting. Great inconvenience has always been felt at the spring of the year, in vessels getting out through the lock of the Spree, on account of their great accumulation during winter; and in order to prevent this difficulty, and to facilitate the ingress and egress of vessels, it is proposed to form a canal, commencing in the Spree at Lützow, not far from Charlottenburg, passing near the terminus of the Potsdam and Berlin Railway, and opening again into the Spree, between the Halle and Cottbusser gates, and inside the walls of the city. On the one side of this canal, which is to be 80 ft. broad, will be a boulevard, laid out in an ornamental manner, and planted with trees, both within and without the city walls. The other bank of the canal will be devoted to the erection of commercial buildings of various kinds. The plan for the improvement of the Köpnicker-Feld consists in planting a large portion of it with trees. This will be in connexion with the above-mentioned boulevard, as well as many of the places of public recreation. It is also intended to improve the ground on which the gunpowder factory formerly stood, which is to be added to the park, for forming a new parade in the south-west front of the House of Invalids, and, at the same time, to form a large basin as a harbour for ships. In the last place, a plan was exhibited for laying out the Friedrichs-Hain, on the outside of the city, which the magistrate of this place wished to establish in memory of Frederic II. These improvements will all be brought into direct combination by a great boulevard-road, and in this manner form a circle of delightful shady promenades.

Re-issue of Royle's Botany.—We are happy to announce the intention of the publishers to re-issue Dr. Royle's very valuable "Illustrations of the Botany and other Branches of the Natural History of the Himalayan Mountains, and of the Flora of Cashmere." It is a very important work, which ought to be in every good library of Natural History; and being about to appear in numbers, will be accessible by many who cannot afford to pay its price all at once.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Catasetum globiflorum. Globe-flowered Catasetum. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—This is a distinct and well-marked species of a very variable genus, and was sent from Rio, by Dr. Gogarty, to the Glasnevin Botanic Garden in 1840, where it has since flowered. The flower-scape is erect, from a foot to a foot and a half high; producing 12 or 15 of its curious globular blossoms. The sepals are mottled with purplish dingy brown; petals of a pale green, spotted with brownish purple; labellum pale green, richly spotted with deep purple towards the margin and dotted with red near the apex.—*Curtis's Bot. Mag.*

Gloxínia spe'ciosa; var. Menzie'sii. Rough-leaved Gloxinia; Mr. Menzies' var. (*Greenhouse Herbaceous Plant.*) Gesneráceæ. Didynámia Angiospérmia.—This beautiful variety has flowered at the nursery of Mr. Chandler, where it is known under the name of Gloxínia Menziésii. The tube of the corolla is white or cream-coloured, with a tinge of purple, and the interior of the almost white throat is elegantly marked with numerous purple dots.—*Curtis's Bot. Mag.*

Rhododendron Smíthii au'reum. Mr. Smith's Yellow Rose-Bay. (*Hardy Evergreen.*) Ericáceæ. Decandria Monogýnia.—This noble hybrid was raised by Mr. Smith, of Norbiton, near Kingston, from a hardy seedling of his own, fertilised with the pollen of Azalea sinensis. It is a hardy evergreen shrub, with the foliage much wrinkled; and the flowers, which form a depressed cone, are individually above three inches across, of a yellow ground, shaded lightly towards the outside with a pale brown tint, and having the top petal spotted with brown. It is an admirable plant for lifting when it comes into flower, and placing in a pot in the greenhouse, for preserving the delicacy of its blossoms for a greater length of time. When cultivated in the open ground, it requires, like all Rhododendrons, a good depth of heath-soil, and a rather shaded as well as sheltered situation. —*Paxton's Mag. of Botany.*

Cœlógyne testa'cea. Testaceous Cœlogyne. Orchidáceæ. Gynándria Monogýnia. (*Stove Epiphyte.*)—An Orchidaceous plant from Sincapore, introduced by Messrs. Loddiges. The flowers hang down in racemes about six inches long, and are of dull clay colour, which renders them anything rather than handsome.—*Bot. Reg.*

GARDEN MEMORANDA.

Waterer's Nursery, Knap Hill.—This is situated in a pleasant part of Surrey, about 5 miles distant from Bagshot, and 2½ miles from the Woking station of the Southampton railway. It is deservedly celebrated for the choice collection of American plants, to which it is almost exclusively devoted, and which appear to thrive as well in this place as in their native country. A great quantity of the Rhododendrons are treated as standards, being trained with the clear stem to the height of 5 or 6 feet, and then allowed to form a bushy head, which certainly renders them highly ornamental. These will be finely in flower in about a fortnight's time; amongst those at present in bloom are a double variety of Rhododendron hyacinthiflorum, which promises to be a free flowerer; a handsome seedling, raised from Catawbiense, and trained as a standard, of a bright rosy purple, with the upper part of the flower almost white, margined with purple, and the throat marked with dark spots; and another of a delicate lilac colour and an excellent shape, having the throat spotted with dark brown. One large plant we observed which must have measured at least 20 yards in diameter. It is not, however, so much the beauty of the Rhododendrons, at the present time, as that of the Azáleas, to which we would call attention. These are just in full perfection, and being planted in dense masses, varying in colour from milk-white to the most intense red, create a brilliant display; many of them are from 10 to 12 feet in height. Among the seedlings raised by Mr. Waterer, are Azálea viscosépala, white, with a yellow throat; this is a cross between viscosa and Indica alba, which latter it very much resembles in the foliage; calendulácea exímia, a bright salmon; Póntica crócea spléndida, buff and orange striped, with a red throat; Póntica zebrina, orange and dark red, a handsome variety, the buds when expanding present a striped appearance; Póntica macrantha, very like the old variety, but far excelling it in size of flower; Sulphúrea grandiflora, light sulphur colour, throat spotted with deep yellow; Glória triumphans, bright rose, throat deep yellow, margined with pink; this is a very free bloomer, and the flowers are well shaped. We likewise noticed some flourishing beds of Ammýrsine buxifólia, Menziésia globularis, Vaccínium stamíneum, and a small plant of the double scarlet Thorn in flower, and some noble plants of Andrómeda floribunda and Kálmia latifólia; one of the latter was 10 feet in height and will shortly be in blossom. An exceedingly fine specimen of Magnólia auriculata is also in full bloom; this is perhaps the largest plant in England, being upwards of 40 feet in height. Pinus macrocarpa appears to thrive uncommonly well in this situation; so also do the various kinds of Junipers, Cypresses and Berberries, of which there is a good collection. A Laburnum is in bloom, which presents the singular appearance of three varieties upon the same tree, viz.—Cytisus purpúreus, C. róseus and common yellow; we were assured by Mr. Waterer that this had never been either grafted or budded.—*R. A., May* 23.

Messrs. Dickson's, Acre-lane, Brixton.—Many of the Tulip-beds in the neighbourhood of London, and particularly on the south side, have suffered from the late unfavourable season. Mr. Dickson's bed, with some failures, contains a fair share of very fine well-bloomed flowers. In the class of Roses, we particularly noticed the following sorts, in admirable condition: Pucelle d'Orleans, feather and flame, fine rose colour upon a delicate white ground, good cup, and the feathering very perfect. Rosa Bianca, feather only; ground, pure white, with good cup; this is a very constant and excellent show flower. Triomphe Royal, very fine; Catalani, very pure ground, with fine-coloured rose markings, in feather and flame, rather too much distributed over the petals for our taste; Cerise à belle forme, a fine and certain flower; it generally comes with the flame only, which is considered by the generality of growers its best character, but it occasionally comes with feather also; La Tendresse, a delicate rose; and Minerva, which is a very beautiful flower. Among the Byblœmens we were delighted to see Holmes' King in such fine condition; generally, the flame is very faint: but in Mr. Dickson's specimens the colour was deep, and the flame perfect, which rendered the flower very attractive. Mentor, or Reine de Sheba, delicate white, with feather and flame: Constantia, or La Virginité, delicate violet, with feather and flame; Belle Actrice, and Rubens, very rich in colour, feather and flame; Franklin's Earl Grey and Sir Edward Knatchbull we saw for the first time; both flowers have well-formed petals and short good cups, each feather and flame—the first a rosy Byblœmen, the latter a deeper colour. The Bizarres are very select; the one commanding most attention, on account of its size and fine colour, is a flower (broken by Mr. Dickson from one of Clarke's breeders) named the Duke of Devonshire; the ground is a bright, clear, lemon-yellow flame and feather, but preferable when with feather only, and rib running half way down the petal; in this state it shows the ground colour, which is very beautiful, to great advantage, contrasting with the deepest brown imaginable: the petals are stiff, and the cup large and well formed. We consider this flower a great acquisition. It comes into the middle row; the foliage is large, and the flower constant, grand, and attractive. Greig's Osiris, deep yellow, with good flame; Surpass Pompey, good cup, and rich colour; Surpass Catafalque, rich yellow, rib with feather, but it is most admired when with feather only; Semper Augustus, delicate feather with rib: Strong's Globe Bizarre, has a delicate lemon ground, with rich and perfect flame, occasionally in a lighter strain; Abercrombie, San joie, or Captain White, flame and feather, very certain. Mr. Dickson's flowers were a good size, and the colours were high and fine; those we have noticed are choice varieties, and are in fine condition.—*May* 21.

Reviews.

Designs for Farm Cottages and Steadings, with Descriptions, Specifications, and Estimates; General Remarks on Farm Offices, and an Appendix of Practical Information. By James Cunningham. Edinburgh: Blackwood.

This useful work forms a thin 8vo volume divided into two parts. The first commences with general remarks upon the present condition of the cottager, and points out the means by which that class might, in a great measure, be benefited. It is the opinion of the author that education would do much towards effecting this, and that better accommodation in the construction of cottage-dwellings ought not to be overlooked, since the deficiency in this respect is one source of the coarse habits to which the poor become habituated. After describing the plan upon which the generality of cottages are built, he proceeds to show where improvements are most necessary, and in what manner they may be effected. This description is rendered more clear by a series of plates exhibiting the front elevation, longitudinal section, and ground plan of his principal designs, and concludes with an estimate of the labour and expenses consequent upon their erection. The second part begins with a general description of barns, stables, cattle-sheds, and other offices belonging to a farm; and one important feature in this part of the work is, the facility which it affords of cheaply adapting the steadings to the wants of successive occupiers. A specification is then given of the manner of building and fitting up these offices; this is accompanied by designs, to which the reader is referred for a better elucidation of the subject. The volume contains also an Appendix, which treats upon the moving powers which may be applied to machinery—on the Ventilation of Farm-offices; on the use of Home Timber in their erection; on the Charges of Interest on Money expended on Farm-buildings; on the Covering of Roofs; and concludes with detailed estimates of Farm-offices by the lineal foot. Altogether it is a good, sensible, and complete guide to both farmer and landlord.

Loudon's Hortus Lignosus Londinensis is now before us. We find that, independently of its use in comprising a list of the hardy trees and shrubs, both indigenous and foreign, which are cultivated in the neighbourhood of London, with their synonymes and the different authors who have described them, it is also valuable in containing an analysis of the more common trees and shrubs of Britain, with the purposes, useful or ornamental, for which they may be grown. In this analysis they are arranged, first, so as to show whether they are valuable on account of their timber, the character of their head, their adaptation to particular soils, or for their produce in fruits or seeds; secondly, they are selected with reference to ornament, according to their bulk, form, mode of growth, foliage, or flowers. The work likewise contains an excellent index of genera and species, including their synonymes.

Loudon's Arboretum Britannicum is, we are happy to state, completed, and forms a thick 8vo volume, of 1162 pages, and 2109 woodcuts. For our opinion of the work we must refer our readers to p. 832 of last year's *Chronicle.*

CALENDAR OF OPERATIONS *for the ensuing week.*

The various delicate tints of the newly-opened leaves, the fresh verdure of the grass, and the gay colours of the blossoms of numerous trees and shrubs, combine to render the pleasure ground more attractive now, than perhaps at any other season of the year; it therefore behoves every one who has the charge of a garden, to heighten this beauty of nature, and enhance its enjoyment by keeping the grounds in the highest order that his means will admit. As the principal planting may now be presumed to be over, more time can be afforded for this purpose—which, however, ought at all times to be made a principal consideration, because inattention to it is certain, sooner or later, to create a distaste, either to the garden or to the gardener, in the minds of proprietors.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—See the directions given last week respecting the shifting of young plants. In pits heated by dung linings, these might be partly renewed, for the purpose of renovating the bottom heat, in preference to adding fresh bark. Give no water for a time to the roots of newly-potted plants; there will be no necessity for it if their leaves are surrounded by a humid atmosphere, and the plants slightly shaded in hot days.

Vinery.—Where forcing was commenced about the 1st of January, the fruit will now be ripe. If a pine-stove has been made use of for this purpose, which is done in many gardens, particular care will be requisite when working among the Pine plants, not to rub the bunches of Grapes; the bloom once destroyed can never be restored, and the finest fruit looks unsightly when deprived of it. If the next house in succession is not sufficiently advanced to come in for table immediately after that now in use is finished, the fruit should be forwarded by a night temperature of 70°, and 80° to 90° by sun-heat (with a moist atmosphere); in no case, however, ought Grapes to be strongly excited during the time that the seeds are forming.

Peach-house.—The fruit in the latest house ought to be moderately thinned, if not already done, before the stoning process commences. Take off all leaves that shade the ripe or ripening fruit, and follow the directions formerly given respecting its free exposure to air, at all times when the weather is suitable.

Cherry-house.—In case the fruit in the second house is ripening, diminish the quantity of water at the roots, and discontinue syringing. Air should also be very liberally admitted.

Fig-house.—See last week's Calendar.

Cucumbers and Melons.—If any red spider be observed, take away the infested leaves immediately, sprinkle the plants with water, and close the lights while the sun shines strongly on them. With the vapour perfectly confined, a temperature of 100° or 105° will not injure the plants; but when it exceeds that point they had better be shaded. Fumigate repeatedly, to keep down thrips—one smoking having but little effect upon that troublesome insect. A few young plants, either from cuttings or seed, should always be kept on hand.

Out-door Department.

Broccoli.—The Purple Cape and Grange's Early White may be sown where they are to remain, putting two or three seeds in a patch, two feet apart; or if ground be scarce, let the plants be one foot apart in the rows; every alternate one to be afterwards transplanted. Sow likewise a little seed of one or two late sorts, to furnish the latest crop next spring. The new variety called Chappell's Cream appears to be an excellent late kind.

Cauliflowers may be treated in the way above recommended for the early Broccolis. If that method be not practicable, sow a bed for transplanting; this should be done immediately.

Cabbages.—In some places very young Cabbages are required during the whole of the season, and to supply these it will be necessary to sow more frequently than is usual. A little seed put in now will come into use after that sown in March; and it will be best to sow two sorts which have been proved by experience to succeed each other.

Carrots.—Thin out the young crops before the plants crowd each other, leaving the Horn variety thicker in the rows than the large sorts; every other plant can afterwards be drawn for use. Also sow a few more rows for drawing young in autumn.

Celery.—Continue to transplant before the plants get too large, or their removal will give them a great check. If the weather be dry, give them a thorough watering, and then cover the damp earth with a little from the sides of the trenches. This method of mulching with mould saves considerable labour in watering, by checking evaporation.

Lettuce.—Besides Cabbage and Cos, sow one or more of the large summer sorts, such as the Malta or the Belle Bonne.

Mustard and Cress.—Keep up a regular supply by frequent sowings; or, if Normandy Cress is substituted, sow a bed of it.

Onions.—Sow the Welch, for drawing young; and the Silver-skinned thickly, for pickling: this last should be put upon poor ground.

Peas.—Sow the same quantity of the same sorts as before, with Spinach between the rows as usual.

Salsafy and Scorzonera may yet be sown, if there is found to be a deficiency of stock. Thin out the first sowing, and also all other young crops that are sufficiently forward.

Orchard.—Persevere in eradicating insects, for the reason given last week. Wall Vines are now forward enough to be dressed and nailed. Stop the fruitful shoots one joint beyond the bunch, and do not retain too much wood and fruit: covetousness in this particular often spoils a crop, besides injuring the Vines for after years. The shoots ought to be trained far enough apart to permit the sun to shine between the leaves upon the wall. Those who wish to excel in Vine culture on open walls will do well to consult Hoare's work on that subject.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Watch carefully for red spider and other insects, using means to eradicate them whenever they make their appearance. Remove seedling Mammillárias, or those which are unhealthy, to a dung-frame, and keep them there during the summer. Apply very little artificial heat at night; in a short time this will not be required, unless the weather is dull and cold.

Greenhouse and Conservatory.—The Greenhouse should be kept rather warmer than before, if it has been filled with tender annuals. A pleasing appearance might be given to the plants which have been set in the open air, by tastefully arranging them in groups. If the pots are set upon a layer of coal-ashes, worms will not get into them so readily. Delicate species must not be exposed to the variations of the weather, but should be kept under glass all summer; for which purpose a low pit, which can be conveniently shaded in hot weather, is well adapted. Examine the roots of unhealthy plants, and repot them in suitable soil; these likewise should be nursed in a pit till they recover.

Pits and Frames.—This department will now be chiefly occupied in raising a stock of young plants and of flowers to decorate the Greenhouse and Conservatory. If the whole of the pits are not wanted for these and the purposes above mentioned, part of them may be employed in the production of late Cucumbers and Melons.

Out-door Department.

Finish the transplanting of annuals, and thin those sown in patches. Many perennials now require staking and tying, but their flowering-stems should first be well thinned out. Fix the stakes so that they may not be seen conspicuously, but be hid by the flower-stems. After the planting and tying are completed, the beds should be hoed and raked. Do not, as is frequently done for the sake of neatness, cut off the leaves of Crocuses or other bulbs which have blossomed. If the appearance of these is objectionable, they should be taken up and temporarily planted in the reserve-ground till the leaves naturally decay.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Seed-beds must be kept free from weeds, which otherwise will soon smother the young plants. The more choice species, both seedling and transplanted, should be watered occasionally in dry weather. Keep grafted Stocks free from suckers, and take off the clay and untie those which have made shoots five or six inches long; these should afterwards be secured to stakes, that the wind may not blow them off.

Forest and Coppice Woods.—Pay attention to newly-planted trees, in keeping the small ones clear of weeds and grass, and preventing those which are larger from being blown about by strong winds. If seeds of forest trees have been sown where they are to remain, and are now coming up, the young plants will require a little care in the way of cleaning about them until they are high enough to overtop the grass.—*J. B. Whiting, The Deepdene*, State of the Weather near London for the Week ending May 26, 1842, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT GARDEN MARKET,

For the week ending May 27, 1842.

The supply of most sorts of Vegetables during the past week has been tolerably good, and every kind of Forced Fruit is becoming more abundant. Trade, upon the whole, has been pretty brisk. *Fruit.*—Pines are very good, and their price continues much the same as last week. Grapes are plentiful, and are somewhat cheaper, from 4*s.* to 8*s* per lb. Of Melons also there is a good supply; they are selling from 6*s.* to 9*s.* each. Peaches and Nectarines are becoming more plentiful, and appear to be very good; their price, however, has not varied since our last report. Cherries are considerably cheaper, having settled to 18*s.* per lb. Strawberries are abundant, at a somewhat reduced price, being from 4*d.* to 8*d.* per oz. Plenty of green Gooseberries may be obtained, and Currants are not scarce; the latter are selling at 6*s.* per half-sieve, the former from 3*s.* 6*d.* to. 4*s.* 6*d.* per half-sieve. Apples still continue to be well supplied; the demand for them is not great, and the Kitchen sorts are considerably advanced in price, fetching from 8*s.* to 12*s.* per bushel, and the Dessert kinds from 7*s.* to 13*s.* per bushel. Cucumbers are abundant, and may be obtained much cheaper, the best not fetching above 1*s.* 6*d.* per brace. *Vegetables.*—Asparagus still continues very scarce, owing to the coldness of the nights; consequently its price is not materially reduced; the best fetches from 3*s.* 6*d.* to 6*s.* per bunch. Cauliflowers are daily becoming more abundant, from 2*s.* to 12*s.* per doz.; and a few Broccoli may still be met with, from 1*s.* 6*d.* to 2*s.* per bunch. Cabbages are plentiful and very good. Peas although still very scarce are much cheaper than they were last week, and are fetching from 14*s.* to 16*s.* per half sieve. Kidney Beans still remain the same; new Potatoes are more abundant, and are selling from 6*d.* to 9*d.* per lb.; the Cornish kinds from 3*d.* to 5*d.* per lb. Young Turnips and Carrots are improving fast; and they are somewhat cheaper than they were last week. Lettuces and all kinds of Salading are somewhat abundant; so also is Rhubarb, the finer sorts of which are selling from 8*s.* to 12*s.* per doz. bundles. *Flowers.*—Of these there are a great variety; the finest among the cut ones consist of Azáleas, Clematises, Borónias, Roses, Gladioluses, Calceolárias, Gardenias, and Picotees.

PRICES SATURDAY, MAY 28, 1842.—FRUITS:—

Apples, Kitchen, per bush. 4*s* to 7*s*
— Dessert, per bushel, 5*s* to 12*s*
Strawberries, forced, per oz., 4*d* to 8*d*
Peaches, per doz. 30*s* to 40*s*
Nectarines, per doz., 30*s* to 40*s*
Pine Apple, per lb. 10*s* to 14*s*
Grapes, hothouse, per pound, 4*s* to 8*s*
Oranges, per doz., 9*d* to 2*s* 6*d*
— per 100, 5*s* to 18*s*
— Bitter, per 100, 7*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Cucumbers, per brace, 6*d* to 1*s* 6*d*
Melons, English, each, 6*s* to 9*s*
Cherries, per lb. 18*s*
Gooseberries, per hf. sve., 3*s* 6*d* to 4*s* 6*d*
Currants, per half sieve, 6*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Walnuts, per bushel, 16*s* to 24*s*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, White, per doz. 1*s* to 1*s* 6*d*
Cabbage, Red, for pickling, 2*s* 6*d* to 3*s*
Cabbage Plants, per doz., 3*s* to 4*s*
Broccoli, Green, p. bnch., 1*s* 6*d* to 2*s*
Cauliflowers, per doz., 2*s* to 12*s*
Peas, per half sieve, 14*s* to 16*s*
Kidney Beans, forced, p. 100, 2*s* 6*d* to 3*s*
Potatoes, per ton, 45*s* to 90*s*
— per cwt. 2*s* 6*d* to 5*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 3*s*
— New, per pound, 6*d* to 1*s* 6*d*
— — Cornish, 3*d* to 5*d*
Turnips, young, per bunch, 6*d* to 2*s*
Carrots, young, per bunch, 6*d* to 1*s* 6*d*
Parsneps, per dozen, 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* to 8*s*
Radish, per doz. hands (24 to 30 each) 6*d* to 1*s*
— Turnip, p. doz. bch., 6*d* to 1*s* 6*d*
Spinach, per sieve, 1*s*
Chives, per pot, 3*d*
Leeks, per dozen bunches, 1*s* to 1*s* 6*d*
Garlic, per lb. 1*s*
Shallots, per lb., 2*s* 6*d*
— Green, per bunch, 3*d*
Onions, per half sieve, 5*s*
— Green, per bch., 2*d* to 3*d*
Asparagus, per 100, large, 3*s* 6*d* to 6*s*

Mushrooms, per pottle, 9*d* to 1*s* 3*d*

Notices to Correspondents.

A Subscriber.—It is very beneficial to cut off the flower-stems of RHUBARB, when not required for seed, and it should be done at an early period of their growth.

A Constant Reader's plants are,—1, Andrómeda Catésbei; 2, Andrómeda arbórea; 3, Spiræa alpina; 4, Lithospermum purpúreo-cæruleum; 5, Gerànium phæum; 6, Gerànium striatum; 7, Mesembryánthemum acinaciforme.

An Essex Subscriber's Apple is the Yellow Buckland.

A. R. Z.—Your plants are,—1, A'llium ursinum; 2, Pedicularis palustris; 3, Lepídium campestre; 4, Sanguisorba officinalis; 5, Gerànium lúcidum; 6, Lithospermum arvense.

L. P.'s plant is Labichea lanceolata.

M. N.—The VEGETABLE MARROW requires to be raised in a hotbed; it may afterwards be planted out in the open ground, protecting it for a week or two with a hand-glass.

A Subscriber.—You will find a full account of the method of PACKING GARDEN-SEEDS for exportation, in a leading article at p. 715 of last year's *Chronicle.*

D. D.—By referring to the Garden Memoranda of this week, you will see that a DOUBLE SCARLET CRATÆGUS is now in flower at Mr. Waterer's Nursery, Knap Hill.

J. T. S.—Patience and perseverance in continually picking or brushing the SCALE from the bulbs of your Amaryllises while in a dormant state, will be more likely to prove effectual than any remedy which we can suggest; removing at the same time as many of the dry exterior coats of the bulbs as can be done with safety, and *burning* them.

Q. Q.—If you cannot accomplish the more sure and simple method of propagating MOSS ROSES by budding, you may increase them by cuttings of the half-ripened wood. The best time for pruning RHODODENDRONS and other Evergreens is early in the spring. There is no way to prevent the scraggy appearance of the WHITE BROOM when out of flower but by cutting out all the dead shoots, and shortening those which are unsightly.

A. B. C.—The proper time to commence shading your PICOTEES is just as the forwardest pods are beginning to expand; and as soon as any of the flowers are opened by all means shelter them during wet weather.

W. Earl.—Your purple PANSY is rich in colour and large; the general form of the flower is very round and good; it also lies flat, but we think that for so large a flower the petals want substance.

E. F.—Pray excuse us: and yet your POETRY has something imperial about it, for it reminds us of that of the late Catharine of Russia. Her Majesty, profoundly afflicted at the decease of her two favourite greyhounds, composed the following epitaph, which has since been considered a model for such compositions:—

> "Ci gît la Duchesse Anderson,
> Qui mordit Monsieur Rogerson."

We recommend this style to your attentive consideration.

If *?* had the misfortune to be the editor of a newspaper, he would discover that there may be very unexpected reasons for many things now unintelligible to him.

R. D.—If a MANURE brings good Turnips and Barley, it ought to bring good Clover. The failure of yours is, we apprehend, owing to the quantity of salt employed; two tons to five acres is a greater dose than we should expect any plants to bear advantageously; half a ton would have been a more useful quantity.

W. H.—We cannot print your letter without your real name. It affects the interests of respectable persons, and cannot be published anonymously.

F. R.—Many thanks for the beautiful Pinguicula, which we have seldom the good fortune to see on this side the Bristol Channel.

Adonis.—Your seedling Verbena is certainly high-coloured, to judge from the specimen sent; but it appears to approach very nearly to V. melindres superba. As, however, we have not a flower of that sort to compare with it, nor an opportunity of seeing your seedling plant, we cannot say whether it is sufficiently distinct to be classed as a separate variety.

W. W.—It is probable that your seedling PINKS will bear a great resemblance to their parents; and if the seed was saved from double flowers, that many of the offspring will come double also; but it is more likely that by far the greater part will be semi-double. If you wait with patience, you will be better able to judge for yourself.

A Young Farmer.—The experiments on AMMONIACAL LIQUOR, conducted by Mr. Bishop, of which an account is given at p. 224 of this year's *Chronicle,* were performed in April.

Pink.—In thinning out the pods of select PICOTEES and PINKS, it is the general practice of florists to leave the extreme or leading bud, and the most forward one upon each of the two laterals below, provided that neither of them are deformed. All the rest should be nipped off at an early stage of their growth.

C. N.—An instance of the curious transformations of the PURPLE LABURNUM is mentioned in this week's report of the Horticultural Society.

H. Major.—Your Princess Royal PANSY is a remarkably pretty flower, from the brilliancy of the blue border which surrounds the delicate lemon-coloured under petals: the eye is fine and decided; the upper petals bright purple. In the Glory of Knosthorpe, the three under petals are of a delicate lemon yellow, the upper petals bright purple; the eye fine, rich in colour, bold, and decided. In the Lovely Bride, the upper petals are purple, the lower of a delicate lemon yellow, with a mark of purple in the lip, the eye dark purple, with a darker pencilling visible. These are three very pretty varieties; they resemble each other in their delicate colour and fine eyes, and also in the substance of their flowers, which, however, in our opinion, is too thin, and is the cause of the lower petals being finely fringed or rough on the edges. The Beauty of Knosthorpe is our favourite, being the best in form, and with a peculiarly fine eye.

Hibernia.—You have allowed your TROPÆOLUM to become too dry, which is the cause of its flowers falling off. Eutáxia can be easily propagated by cuttings. A description of six new Fúchsias is given in the Notices to Correspondents of last week; we have not seen any of the varieties there described. The following are good sorts which we *have* seen: Fúchsia cordifólia, splendens, fulgens, radicans, Standishii, Chándleri, exímia, stylosa conspícua, grandiflora máxima, formosa élegans, Riccartónia, globosa major, and Moneypenniana.

A. S.—Your plant is Spiræa lævigata.

J. B.—Your plant of FUCHSIA CORYMBIFLORA will soon recover. It has either been attacked by insects, or is suffering from cold. Proteaceous plants are very easily managed, like other greenhouse plants, provided care is taken that water cannot accumulate about their roots: it is absolutely necessary that their drainage should be as complete as art can make it. This, with a free circulation of air, being attended to, the thing is done.

Stupid.—VINES, when in flower, require a moderate quantity of air: it is, perhaps, better to give them too little than too much at that period of their growth, especially if it be windy weather. If the Vine border requires watering, SOAP-SUDS are preferable to either manure or pond water. If PELARGÓNIUMS are watered frequently with *strong* liquid manure, their leaves will become yellow; once a week is quite sufficient, and then it should be mixed with an equal quantity of water. Common Green Vitriol, or SULPHATE OF IRON, will answer the same purpose as Gypsum in fixing Ammonia; pouring it in the manure-water only so long as you can perceive an offensive smell. You had better transplant your young TOBACCO PLANTS in a rich border; they will not be ready for use until after the seed is ripe, when the plants may be pulled up, and hung in a dry airy place till wanted for use. It will answer your purpose for making Tobacco-water, as well as for fumigation. They say you may destroy Caterpillars upon Gooseberry-bushes by dusting HELLEBORE-POWDER over them, but some persons deny this. Eccremocarpus scaber, and all the varieties of Anagallis, are half-hardy Creepers, and may be transplanted into the open border. Cobæa scandens requires protection in winter. CUCUMBERS should not be stopped at every joint; only where there is a fruit at the next joint below. VINES, trained on the rod system, may be stopped at one joint above the bunch, provided the shoot is not wanted to extend itself for next year's bearing-wood. To destroy the APHIS on your Pelargóniums, you must fumigate them, and not water them over-head with Tobacco-water.

S. Dago.—The larger of your plants is Neóttia Nidus avis; the smaller one is Ophrys Myodes.

Mr. R. Briar's note contained no Curcúlio when it arrived. If his beetle be the Sitona linearis, all that we can say at present about its destruction was communicated at p. 337. We wish he would ascertain the insect which erodes the edges of the Broad Bean leaves. In the gardens I have visited in Wiltshire, the leaves are all indented in the same way.—*R.*

R. G.'s large hairy caterpillar will produce a very beautiful moth, called Bombyx (Eyprepia) Caja, Linn.; it feeds upon a variety of plants and vegetables, from the Nettle to the Lettuce, which it sometimes attacks in good earnest.—*R.*

J. Barnes.—The best of your seedling Pansies is No. 5. The flower is of a good form, and large; the ground colour bright yellow, increased in richness in the lower petal; the eye dark and brilliant: the broad band of purple which surrounds the bottom and side petals; is rich in colour, but terminates rather too abruptly at the top; the edges of the petals are even, and free from the roughness generally found in large flowers: upper petals rich purple: it is a fine variety. No. 9 resembles No. 5, but is inferior in every respect: it is not so rich in colour; the band on the side petals is of the same colour as the upper petals, a bluish purple, on the lower petal it is of a bronzy purple. No. 31, a bronzy purple, is not so good as several already out in the same way.

Discipulus.—SALT AND WATER must be extremely weak if applied to plants; an ounce of salt in a pailful of water is enough. QUICKLIME will do no harm to anything, except slugs and such "small deer." The smoke of burning SULPHUR will destroy foliage. You may consider PEACHES and NECTARINES to be fairly stoned when a pin will not pierce them. The Catalogue of the Horticultural Society is descriptive of Fruits, in a tabular form, but includes no information about cultivation. We cannot send you "Paxton's Calendar" unless you send your address.

Peto—next week.

A. B. C.—It is quite impossible for us to recommend the VENDORS of manures, or of anything else. They must make themselves known by means of advertisements, or they must go without orders. We are sorry to refuse but necessity compels us to adopt the rule. Graves are the refuse of the tallow-makers; Willey dust is unknown to us; Bran is sold by millers. As your letter bears the post mark of South Lambeth, we should think you might *smell* out the Bone-crushers.

T. M. W.—BOKHARA CLOVER seed may be had of every respectable Seedsman, who, if he does not keep it, knows how to procure it. It is best to drill it.

No Teetotaller would probably be better if he was one. At least we do not understand his meaning; in the beginning of his note he says, that his Orange trees are very healthy and grow well, but drop their fruit; but then he adds that one of these trees is quite stunted and almost dead. What are we to understand by this? Nothing is said of the state of the soil, or the temperature of the house, or of any other circumstances connected with the Orange trees. In the absence of such information we cannot possibly give any advice.

Blunderbuss.—It is immaterial in what proportion you mix the stable MANURE and mould; the more there is of the latter, the weaker it will be. Sea sand will much improve it because of the salt as well as shells it contains. We are unacquainted with the sickle hoe; nothing is better than the common draw hoe. Spring-water cannot be made like rain-water; but it may be much improved by exposure to sun and air; and still more so by the addition of a very small quantity of gas-water. The DOUBLE ROCKET may be propagated by cuttings planted in any light sandy soil, beneath a hand-glass, and shaded during sunny weather.

J. C. L.—If your Brugmansia retains its large spathaceous calyx, it must be new. Floripondio is the name given to Brugmansia coccinea. We are not acquainted with the present species.

Surreyensis.—If your LAWN is foul, you *must* thoroughly clean it by pulling out the weeds. It is not absolutely necessary to sow the bare places with Grass seed, because the Grass itself which is left will soon spread and hide them. If, however, you are impatient, you had better employ Crested Dogstail Grass, Poa pratensis, and White Clover; it is unnecessary to employ any other mixture. A small quantity will do, unless your ground is very bare; what quantity it is impossible for us to say.

Exeter.—To grow DAHLIAS in POTS, you must select the dwarfer and more free flowering kinds, the taller ones being totally unsuited for that purpose. After they are started, and when the shoots are about three or four inches long, pot them singly into small 60s, in any light rich soil; water them freely, and place them in a hotbed, keeping them close for a day or two, and shading them during sunshine. They will (if properly attended to) be rooted in about 10 days, and should then be removed to a much cooler place, and have plenty of air. When well established, shift them into larger pots, and finally, before placing them out of doors, repot them either into 12s or 8s, according to the size of your plants. Top the leading shoots to make them bushy; and when the danger of frost is over, they may be plunged in the open border, which saves much labour in watering; but even then they must be watered copiously in dry weather. They will flower freely all the summer and autumn, although the blooms will not be so fine upon plants grown in pots as upon those in the open border. After flowering, cut the tops off, and place the pots containing the roots in any dry cellar, or other place where they will be secure from frost during the winter. Young plants struck from cuttings flower much better in pots than the old roots. We are much obliged, but, unfortunately, the Numbers of the *Gardeners' Chronicle* of which you have duplicates are the same as those we already possess.

Deal.—The Rose you sent is the Yellow Banksian.

Mr. Mills's letter contains nothing but what has already been stated more than once in our columns. We will not re-open the question about Chapman's Potatoes till the experience of a season has proved what they really are.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

OUR news from France is confined to the debates in the Chambers. The chief subjects of discussion have been the Right of Search Treaty, and the new Tariff of the United States, which involves some important questions affecting the interests of France. On the former subject the Chamber of Deputies has almost unanimously declared its opposition to the ratification of the treaty, and M. Guizot, pressed for an explicit avowal of the intentions of Government, has announced that although in his opinion the nation is morally pledged to ratify it, he considers himself called upon to refuse the ratification in its present form; while at the same time he declines to pledge the responsibility of the Crown as to its future acts. The questions at issue with the United States arise out of the proposed increase of the duties on French imports in the Tariff at present before Congress. In the discussions to which this proposal has given rise, the Ministry admitted the importance of the subject, and stated that the most urgent remonstrances had been made to the American Government, but without effect; that the adoption of reprisals, as suggested by the opposition, was likely to prove more injurious to France than to the United States; and that the whole subject was still under the serious consideration of the Government.—In Spain, much speculation continues to prevail respecting the rumoured changes in the Cabinet; but there appear no reasons to believe that any immediate modification will take place. The Cortes have been occupied with the discussion of the Supplies, and of a Bill for the reorganisation of the Navy. The Ministry appear to be earnestly endeavouring to repair the financial condition and credit of the country, and the details of another plan for raising a loan have been made public. Some disturbances of a political character have occurred in the provinces, and apprehensions are expressed for the tranquillity of Catalonia.—From Portugal we learn that the Slave-trade and Commercial Treaties with this country have been finally agreed to by the representatives of both

Powers; but the questions connected with the mutual reduction of the tariff, the principle of which has been already admitted, are still unsettled.—The late fire at Hamburgh continues to be the prominent topic of interest in our German news: the more immediate effects of the calamity have been removed, business begins to assume its usual activity, and active measures are in progress for rebuilding the city on an improved plan. The accounts from all parts of the Confederation are filled with details of various measures for the relief of the sufferers; and large sums of money continue to be collected for this purpose in the principal cities of Europe. The anxiety felt as to the means of the local merchants to fulfil their obligations is gradually subsiding; and although a few failures have occurred, the general condition of the commercial classes is represented to be sound.—Our Berlin news contains some particulars of the intended plan of the King of Prussia for relieving the Jews from the restrictions imposed upon them by the existing laws, and for organising them as a distinct corporation. The most important concession is their release from the obligation of military service; and in a recent decree the King assures them that, although he considers it necessary to withhold from them any privileges calculated to cause a prejudice to the Christian communities, no amelioration will be refused which may be compatible with the more general and more elevated interests of society.

At home the new Tariff has chiefly occupied the attention of Parliament. Numerous amendments on different clauses have been brought forward, but without success: the most important of these was one proposed for regulating the duty on foreign cattle by weight, with the view of affording greater protection to agriculturists. After a long debate, the amendment was negatived by a large majority; and the Bill has thus far passed through its early stages without any material modification.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal continue well. On Wednesday the Court returned from Claremont to Buckingham Palace, where it still continues. On Monday his Excellency Count Mensdorf, general in the Austrian service, uncle of her Majesty and Prince Albert, and brother-in-law to the Duchess of Kent, together with his four sons, Counts Hugh, Alphonso, Alexander, and Arthur, arrived at Buckingham Palace from the Continent, and proceeded to Claremont on a visit to her Majesty. On Thursday the Queen and Prince Albert, attended by a numerous suite, honoured the ball at her Majesty's Theatre, given for the benefit of the Spitalfields weavers. We are informed by the Morning papers that the Prince de Joinville and the Duke d'Aumale, sons of the King of France, are expected in this country on a visit to her Majesty in the course of the ensuing month; that the King and Queen of the Belgians will arrive about the same time; and that his Imperial Highness the Archduke of Austria is also expected on a visit about the latter end of June. It has been announced that her Majesty will hold a levee at St. James's Palace on Wednesday next, and a drawing room on Thursday the 16th of June. The Earl of Morton and Capt. Meynell have succeeded the Marquis of Ormonde and Capt. Duncombe, as the Lord and Groom in Waiting on her Majesty.

Official Appointments.—The Queen has appointed A. W. Young, Esq., to be Sheriff of the colony of N. S. Wales.

Parliamentary Movements.—The Cork County Election Committee has decided that Daniel O'Connell, Esq., and E. B. Roche, Esq., were duly elected for the County of Cork. Thursday next has been fixed for the County of Derry election: Sir H. Bruce has retired, and Mr. R. Bateson is now the only candidate.

Foreign.

FRANCE.—*Right of Search Treaty.*—The Paris papers are chiefly filled with reports of the debates in the Chamber of Deputies; the most interesting feature in which is the continued discussion on the right of search treaty, the commencement of which was given in our last, together with the declaration of M. Guizot, that it was not the intention of Government to ratify the treaty either before or after the elections. The majority of speakers who have since addressed the Chamber on this subject expressed themselves decidedly hostile to the treaty, and the Chamber has almost unanimously declared itself opposed to its ratification. At the close of the debate M. Guizot rose to reply to some observations of M. Berryer, by whom he had been charged with not having expressed himself in terms sufficiently sincere; and in a speech which elicited great applause from all parts of the house, entered into the history of the negotiations relative to the suppression of the slave-trade, and contended that "the course pursued by preceding Cabinets pledged the country morally to conclude the treaty of the 20th Dec. 1841." M. de Salvandy then rose to defend Count Molé's Administration, of which he had been a member, and proved from official documents that Marshal Sebastiani, when filling the post of Ambassador to the Court of London, signed a protocol in London in the year 1838, contrary to the express instructions of Count Molé, and contended that a protocol so signed could not bind the nation. M. Guizot rose to explain, and said, "that although he was of opinion that the nation was morally pledged to conclude the treaty of the 20th Dec., still he considered he was free to refuse to ratify it." This observation, which M. Guizot repeated several times, was received by the Chamber with much disapprobation. M. Dupin then rose, and declared that "it was absolute nonsense to assert that the nation was morally pledged to conclude a treaty to which the country was determined not to adhere." He concluded by recommending the Government to take measures for the abolition of slavery, but, at the same time, to secure the independence of white men and the honour of the national flag. M. Guizot afterwards again addressed the Chamber on this subject, and concluded by stating that the treaty had not been ratified, and in its present form would not be ratified; but he declined to pledge the responsibility of the Crown as to its future acts.

The Chambers.—With the exception of the debate on the right of search treaty, the only topic of interest that has occupied the attention of the Chambers has been a question of some importance affecting the commercial relations between France and the United States. In the course of the discussion of the supplies for the Foreign Department on Saturday, M. Legentil directed the attention of Government to a system of imposition practised by the American authorities towards foreign merchants, which, if it continued much longer, must, he said, end in the complete rupture of all commercial relations between France and the United States. According to the new tariff now before Congress, the import duties of 20 per cent. would be shortly raised to 30. This tariff combined with a duty *ad valorem* another on the weight; so that certain goods, and the silks among others, would be liable to pay a duty *ad valorem* and a weight duty, which, on an average, would amount to 15 or 20 per cent. also—in all to 35 per cent. The wines and other products of France were to be subjected to similar duties on their importation into the United States. The latter, on the other hand, with a view to compel foreign nations to consume their tobacco and flour, were about to lay a tax of 10 per cent. on the products of the countries which did not admit those two articles on the same terms on which they were introduced into America; so that the produce of France would be shortly burdened by another duty in addition to the general duty of 30 per cent. M. Legentil then recapitulated the advantages which France had conferred on the United States, which he thought entitled the former to more gratitude on their part, and concluded by saying that, should the Americans persist in their pretensions, he should recommend that France abrogate the Navigation Act of 1822, which assimilates the vessels of the United States to those of France, and have recourse to reprisals. M. Guizot, in reply, admitted that the measures about to be enforced by the United States were likely to be most injurious to the trade of France. Impressed with that persuasion, the Government had, during the last year, repeatedly addressed to the United States the most urgent remonstrances; but it was impossible for him to tell what would be the result of those representations and negotiations, because of the financial and internal crisis now prevailing in the United States, which prompted the latter to adopt extreme measures as respected reprisals. If the expedient of reprisals militated against the United States without injuring France, recourse should be instantly had to it; but he thought that France could not with safety increase the import duties on the raw materials constituting the great element of her manufactures. With regard to the navigation duties, the case was different; but he would not express any opinion on that subject, as the question was now undergoing serious examination before a committee composed of competent and enlightened men; but when they should have made known to him their advice, he would propose such measures as appeared to him expedient, and be ever guided by the principle that reprisals are good only inasmuch as they affect the interests of others without injuring those of France. After a few remarks from one or two Deputies, the subject dropped. The other business of the Chamber has for the most part consisted in voting the different chapters of the Budget. On Tuesday, during the discussion of the budget for the Departments of Agriculture and Commerce, one of the Deputies having called the attention of the Minister of Commerce to the distressed state of the manufacturers throughout France, and having complained of the increasing importation of linen thread, principally from England, which was now threefold greater than in the year 1836, the Minister said, he was anxious to declare that the position of the linen manufacturers was worthy the solicitude of Government. "This branch of trade must be relieved," said the Minister. "It is quite true that the importation of linen thread from England amounted last year to 12 millions of kilogrammes (12,000 tons). It is but too true that the number of operatives employed in the linen manufacture has been reduced from 100,000 to 50,000. I promise, therefore, that in the interval between the present and the next session of the Chambers, the Government shall occupy itself with the subject, with a view to the relief of the linen manufacture." This statement was understood to convey a pledge that in the interval mentioned an increased duty would, by Royal Ordinance, be laid on the importation of British linen thread. The Chamber of Deputies has disposed of the budget of commerce and agriculture. The committee on the railroad bill, in the Chamber of Peers, having declared for the adoption of the bill as passed in the Chamber of Deputies, it is expected that the dissolution will take place about the middle of June, and that the general elections will come on in July.

The Capital.—The Infants of Spain, sons of Don Francisco de Paula, were shortly expected to arrive in Paris. Private letters state that their movements have no connexion with the alleged intention of the Regent to bestow on the eldest the hand of Queen Isabella. The King has placed in the hands of the Minister of the Hanse Towns, in Paris, the sum of 20,000f. to be remitted to Hamburgh, towards the relief of the sufferers from the late fire. The committee of Peers, Deputies, &c., for receiving subscriptions, have published a list, making a total of 12,300f. Among the last contributors is the name of M. Guizot, Minister of Foreign Affairs, for 500f. A list of subscriptions has also been published by the committee of merchants and bankers of Paris, which shows that the total amount received by that committee, including 15,000f. given by the Bank, is 125,954f. Ali Effendi, the Turkish Ambassador to the Court of England, has arrived at Paris, on his way to his post, accompanied by his first secretary, Hair Effendi. The palace of the Elysées Bourbon has just been prepared for the reception of the Duke de Mecklenburg, whose arrival was daily expected. Mr. Washington Irving, Envoy of the United States to Spain, had arrived in Paris, on his way to his post. Lord Cowley, the British Ambassador, gave a banquet on Tuesday, in honour of her Majesty's birthday, which is said to have been one of the most splendid entertainments ever given in Paris.

The Fleet.—Accounts from Toulon of the 20th inst. state, that the Medée frigate left that port on the 17th inst. to join Admiral Hugon's squadron at the Hyères; and add that that squadron quitted the islands on the 18th, and was not expected to return for some time. All the vessels composing it had sent their sick to Toulon. Private letters contradict the reports of the expected arrival in Toulon of the Prince de Joinville, and state that the First Lieutenant of the Belle Poule has received despatches, announcing the intended departure of his Royal Highness for London, and giving orders for the frigate to join Admiral Hugon's squadron. The papers state that the Minister of Marine has sent express orders to all the ports at which steam-vessels are on the stocks, to have them finished with the utmost expedition.

Algeria.—Accounts have been received from Algiers to the 14th inst., but they add nothing to the information already communicated of the movements of the French Army. The "Moniteur Algérien" of the 14th merely gives a summary of the despatches relative to the affair between the troops of Abd-el-Kader and the division under Gen. Bedeau, on the 29th ult., an account of which we have given in a previous Number. Gen. Bugeaud was still at Mostaganem on the 13th inst., but he was preparing to set out for the Cheliff. Toulon papers state that it was reported in Algiers that Gen. Bedeau had defeated the army of the Emperor of Morocco, with the loss of 300 killed, and a great number of prisoners; but the rumour appears to require confirmation.

SPAIN.—Our intelligence from Madrid possesses little political importance. Speculation was still busy respecting probable changes in the Ministry; but there appears to be little ground for anticipating any immediate modification of the Cabinet. Much interest had been excited in the capital by a great banquet given by the Regent on the 15th inst., in the palace of Buena Vista, to the Infante Don Francesco de Paula. The Foreign Ministers, the Presidents of the Supreme Tribunals, the Queen's Guardian, the Patriarch of the Indies, M. Olozaga, leader of the opposition, and a number of other distinguished persons, were among the guests. The Cortes have been occupied with discussions on the different items of supplies, and have approved the extraordinary credits demanded by Government by a majority of 88 against 44. The Minister of Marine has brought forward a bill relative to the Navy, in which it is proposed that the total strength shall amount to one line-of-battle ship, four frigates, one corvette, nine brigs, eight schooners, four steamers, and nine vessels of smaller dimensions. A corps of sailors is to be enrolled of 3,260 men, and the marine artillery is to amount to 2,400. It was rumoured in the financial circles of Madrid that Government contemplates the issue of a new loan, bearing interest at 3 per cent., to the amount of 1,500,000,000 reals; but the success of the plan appears in the best-informed quarters to be considered doubtful.—Some rioting took place at Seville on the 10th inst. Groups of workmen, belonging mostly to the tobacco-manufactory, traversed the streets singing the "Marseillaise," and crying, "Down with the Regent!" "The Republic for ever!" The authorities however succeeded, without much trouble, in repressing those disorders; and the Political Chief issued a proclamation, declaring that every workman forming part of a group of six persons, who should not disperse within a quarter of an hour after the publication of the proclamation, should be arrested and tried by court-martial. Subsequent accounts have been received, announcing that tranquillity had been entirely restored. Disturbances of a more serious nature occurred at Chiclana on the 11th inst., in consequence of a degree of the Ayuntamiento laying a tax on the people of the town, the proceeds of which were to be appropriated to the armament and equipment of the militia. A detachment of 40 soldiers of cavalry at once proceeded to the scene of disturbance; and the revolters refusing to submit, the troops were compelled to use their arms, and killed and wounded a number of persons. The Barcelona papers mention that the Carlist chief Felip had re-appeared in the mountains of Upper Catalonia with a more numerous band, and had caused much uneasiness in that city. Accounts from Cadiz inform us that two placards in favour of Maria Christina had been found in the Constitucion-place; that rumours were in circulation of the appearance of 200 armed men in the Sierra de Saona, and that this event had caused the departure of troops and National Guards towards the menaced point. Private letters from Figueiras announce that Don Abden

Ferradas, the head of the Republican party, against whom a warrant had been issued by the authorities, has taken refuge in France.—Intelligence received in Paris on the 26th from Barcelona has excited great uneasiness for the tranquillity of Catalonia. The Captain-General has, however, taken every precaution to repel any act of aggression, by ordering reinforcements to march to Barcelona from the neighbouring garrisons; and the French force on the coast is also to be increased.

Portugal.—We have intelligence from Lisbon to the 16th inst. The general treaty of commerce, as well as the slave trade treaty, were understood to have been agreed to by Lord Howard and the Duke of Palmella; and it was expected that they would be forwarded to England by the next packet. A council of state had been summoned for the 17th, in order to sanction the course adopted by the Duke of Palmella on the subject. It was thought that the question of the mutual reduction of the respective tariffs, the principle of which had been agreed to, would occupy some time. The Government is said to be disposed to liberal concessions, in return for the large reduction which is expected to be proposed on Portuguese brandy, wines, and fruits; but several difficulties appear to stand in the way of a satisfactory arrangement, the chief of which are the opposition of parties interested in manufactories established under the high protective system; the state of the revenue, which makes a large reduction of duties a serious experiment; and the combined efforts of the party opposed to any concessions to England. The English dividends had been provided for by an arrangement between the Board of Public Credit and the Bank: the new funds made over to the former for the purpose had not yet realised a sufficient sum, but the Bank, it was said, would advance the amount requisite, receiving the same from the board in proportion as its income was realised. It had been reported that Government intended issuing a new paper money, called "copper notes;" but this is denied by the Government papers. Three more failures had taken place in the wine trade at Oporto, to the amount of 150 contos of reis. The Count de Raczynski, Prussian Minister to Donna Maria, had arrived at Lisbon. A Danish prince was expected at Lisbon on a visit, in a frigate, on his way to the Mediterranean.

Germany.—The Austrian journals contain an autograph letter from the Emperor to the Chancellor Mitrowsky, recommending that subscriptions in favour of the sufferers by the fire at Hamburgh be opened throughout all the provinces of the empire, and inviting the Archbishops and Bishops to aid in this measure throughout their respective dioceses. Private letters from Vienna state that as a means for meeting the extraordinary expenses of the railroads, the Government is about to issue bills of from 50 to 5,000 florins each, similar to bank notes, payable to bearer, but carrying an interest of three per cent. per annum. They are to have on their backs a table, indicating their precise value, including interest, on each day of their circulation, at which they may be received by the public, and will be paid by the Treasury.—Private letters from Berlin of the 13th inst. state that M. de Rochow will continue to act as Minister of the Interior until the 1st July, when Count d'Arnim will commence his functions. They also mention a report that the King of Prussia has offered to lend a million of crowns to the city of Hamburgh for three years, without interest. It appears that the Jews lately presented a petition to the King of Prussia, praying that their body might not receive an organization as a private corporation, nor be subjected to special obligations, as a compensation for being relieved from military service. The journals contain the King's reply to this petition, in which his Majesty states "that his intention is to adopt measures which will relieve Israelites from the restrictions imposed on them, and secure their relations with Christian communities, by giving to their private interests more independence and authority through the formation of corporations. Means will be thus afforded them to give their faculties a greater development, both in their own interest and that of the Christian population; but his Majesty thinks it necessary to attach all those advantages to conditions based on the essence of a Christian state, according to which it is not permitted to grant the Israelites any power over the Christians, or any privileges which would be calculated to cause a prejudice to the Christian communities. The preservation of the rights enjoyed by the Christians must consequently counterbalance the suppression of these restrictions. These two objects can only exist united, and cannot be separated. In relieving the Israelites from the obligation of military service, they will not be deprived of any advantage, as they may always enter the service voluntarily. At all events, the Israelites may calmly wait the result of the deliberations commanded on the subject, and they may depend that no amelioration will be refused them compatible with the more general and more elevated interests of society." The papers give accounts of several fires which have occurred within the last fortnight, the most serious of which occurred at Pozey, in Croatia, where no less than 168 houses were destroyed in a short time, and fifteen persons perished.—Private letters from Muskau, dated the 12th inst., state that Prince Pückler, who has for some months had in his service the famous pedestrian Meusen, sent him off on that day for Cairo, giving him letters of recommendation for several persons of distinction. Meusen is to pass by Jerusalem. He is charged by the Prince to discover the sources of the White River, as well as to determine the real position of the mountains called the Mountains of the Moon, which, up to the present time, have been considered fabulous by many persons. Meusen formerly took a journey from Calcutta to Europe, through Affghanistan, Persia, and Syria, and did not meet with the slightest accident. He can easily walk 20 German miles (92 English) a-day, requiring for food only a loaf of bread. He is to embark on the Nile for Karthum, and as the pretended Mountains of the Moon are, if they exist, only five degrees of latitude from this place, he could reach them in four days. Great hopes are entertained that his journey will be crowned with success.—Subscriptions for finishing the cathedral of Cologne have been opened at all the principal towns in Germany; and the sum raised for this purpose in Berlin already amounts to about 1,650*l.*, more than a fourth part of which is said to have been subscribed by Jews.—The journals publish the following statistics relative to the population of the states composing the German Customs Union: Prussia, 15,159,031 souls; Bavaria, 4,375,586; Saxony, 1,706,276; Wurtemberg, 1,703,258; Baden, 1,294,131; Electoral Hesse, 666,280; Grand Duchy of Hesse, 820,907; the Duchy of Nassau, 398,095; the free town of Frankfort, 66,338; the union of Thuringen, 952,421. Total, 27,142,323 souls. The income derived from the duties levied by the Union amounts in Prussia to 14,701,856 crowns; Bavaria, 1,681,171; Saxony, 1,878,177; Wurtemberg, 474,449; Baden, 846,364; Electoral Hesse, 40,867; Grand Duchy of Hesse, 515,415; Nassau, 35,142; Frankfort, 1,026,461. Total, 21,915,921.

Hamburgh.—Accounts have been received from this city to the 23d inst. The late calamity continues to be the principal topic of conversation. Considerable anxiety appears to prevail amongst all parties having commercial relations with the place as to the means of parties fulfilling their obligations. A few failures have already taken place, and an extensive corn-broker has stopped for an amount of 60,000*l.* It is, however, stated that the general condition of the commercial community is sound, and that business, which was for a time suspended by the recent calamity, is resuming its ordinary activity. In the mean time, the clearing of the streets is actively advancing, and plans are in progress for the improvement of the city. Mr. Lindley, the English engineer, who distinguished himself during the fire by his exertions to arrest the progress of the flames, is one of the persons appointed to draw up a plan for this purpose, and his proposal is said to be, that the New Exchange should be made a centre, towards which a number of fine broad streets should converge. A portion of the walls of St. Petri's Church, which had been left by the fire in a dangerous state, has been thrown down by gunpowder; but unfortunately in the operation four or five soldiers near the spot were injured by the falling of the bricks, and one man was killed. A number of workmen are employed in covering every vacant spot with wooden houses for the use of small shopkeepers, who are thus enabled to resume their business. Various reports exist as to the mode which will be adopted of raising money for the reconstruction of the city, but nothing official has yet transpired on the subject. Large subscriptions for the relief of the sufferers continue to be received from various foreign states. In addition to those mentioned in our last, the Emperor of Russia has forwarded 80,000 marks banco; and the King of Saxony has appropriated 1,600 louis-d'ors for the purchase of stone and timber, to be used in the construction of new buildings. In Frankfort and other places, ladies' bazaars are about to be established for the purpose of raising money; and accounts from the former city state that 5,000 florins have been subscribed by M. Rothschild, and 1,000 more by some of the banking establishments. The King of Wurtemberg has contributed 10,000 florins from his private purse, and 5,000 marks banco had on the 15th inst. been collected at Stuttgard. The Orphan House, in the Admiraletale-strasse, will be used as a Senate-house until a new one can be built; and the orphans will in the mean time be removed to Harvelsleteude. It is stated as a fact, that pieces of burning paper, tapestry, silk, &c., fell in Lübeck, and even to a greater distance from this city, during the conflagration; and that the reflection of the fire was seen in the Baltic by the passengers in a Swedish steamer, and also by ships in the German Ocean, at a distance of 100 miles from the city. A correct statement of the extent of the damage done by the fire has been published, and may be interesting to some of our readers; it is as follows:—61 streets, 120 courts, 1,992 houses, and 1,716 dwelling floors (Etages, Sähle); 498 cottages, 468 dwelling cellars; 21,526 inhabitants roofless; 3 churches, 2 synagogues; 3 watermills, with 36 wælves; the Spinnhaus and Zuchthaus, with their churches (houses of correction); the Detentions House; the Senat House; the Old Exchange; the Eimbeck House, containing court of commerce, court of common pleas, with offices: the custom-house offices, the stamp offices, the lottery saloon, the citizen guard offices, and other public offices; the Bank; all the largest hotels, and all the libraries. 3,786,300 square feet is the superficial extent of the burnt portion of the city.

Italy.—Private letters from Naples state that the French Government has undertaken the mediation of the pecuniary questions which have arisen between Holland and Naples, and that a squadron is to be sent from Toulon to watch any movements that may be made in the Mediterranean by Dutch ships of war.

Russia.—Private letters from St. Petersburg announce the sudden death in that city, on the 4th inst., of the celebrated traveller Sir Robert Ker Porter, in his 62d year. It appears that on the morning of the 3d inst. he went to court to pay his respects to the Emperor, and afterwards made two or three visits to private friends; on arriving at his house, about 3 in the afternoon, the servant, on opening the door of the carriage, perceived that his master was holding himself in, and that he moved to the door with much difficulty, and before he could descend the step, he fell down from the effect of an apoplectic stroke, and was carried up stairs; he took a little water, but soon after lost his consciousness, and expired at 8 the following morning. It seems that he had on the previous day written a letter to his brother, Dr. Porter, of Bristol, announcing his intention to return immediately to England.

Turkey.—By the arrival of the Levant mail we have advices from Constantinople to the 7th inst. Intelligence, said to be of an undoubted character, had been received in that capital from Syria, announcing the arrival of an Egyptian frigate and corvette at Beyrout, with Egyptian troops; and adding that Suleiman Pacha was expected shortly to arrive from Alexandria, with an additional reinforcement of four regiments (16,600 men), the greater portion of whom were already *en route*. This force is intended to co-operate with the Turks in the complete disarmament of the Lebanon. The other news from Constantinople is not important. The misunderstanding between Sir S. Canning and the first dragoman is said to have been arranged. Tahir Pacha, the high admiral, has just bought from his colleagues, for a sum of 50,000,000 piastres, a right of farming the Stamboul Customs for the ensuing year. Sir Baldwin Walker had received an appropriate sword from the Vizier, coupled with an assurance that the former one, which had been returned by Sir Baldwin, as noticed in a former number, had been sent entirely through mistake. M. Mavrocordato addressed a note to the Porte, dated the 25th April, in which he states that the refusal on the part of his majesty the King of Greece to ratify the treaty of commerce and navigation, negotiated and signed on the 3d of May, 1840, by M. Zographos, has given rise to discussions, the more to be lamented, that they are opposed to the real interests of the two states; that M. Zographos was not furnished with competent authority to sign such a treaty; and that the present government, being desirous to terminate this unpleasant state of affairs, now offers proposals to the Porte to exchange powers with it, and to negotiate a new treaty on the basis of the former, but with certain indispensable modifications.—The following additional intelligence from Constantinople, dated the 7th inst., has since been received through private letters received by way of Paris. Riza Pacha, Grand Marshal of the Palace, has had such a severe attack of a pulmonary nature, that his medical attendants entertain but faint hopes of his recovery. The Grand Vizier is obliged to keep his bed from a wound in his thigh, which has opened afresh, and which, it is feared, may render amputation of the limb necessary. It is stated that Tahir Pacha proposed, at a council of ministers, to despatch to Tunis a commissioner to watch the conduct of the Dey; but the Sultan opposed it, on the ground that he did not wish to give umbrage to his friend and ally the King of the French; and further, ordered steps to be taken to put an end to the intrigues of the Prince of Samos, who was said to be everywhere exciting a feeling of hatred towards France. The Sultan had increased the 'appointments' of Fethi Pacha, and in a private audience is said to have expressed to him the greatest friendship and regard.

Egypt.—We have intelligence from Alexandria to the 6th inst. The expedition which Mehemet Ali sent last year to explore the course of the White River in Nigritia had returned to Cartum, after an absence of 6 months, having failed in its object, the course of the river being impeded with rocks and cascades. Two Frenchmen, employed by Mehemet Ali to make mineralogical observations in the country, brought back several specimens of copper and iron. The Pacha had forbidden any slaves to be made; but, contrary to his instruction, several of the inhabitants were brought back to Cartum in chains.

United States.—Our readers will perhaps be interested in perusing the following abstract of a pamphlet published by Dr. Channing, the American divine, which has appeared in the *Morning Chronicle*. It embodies the writer's opinions on the subject of slavery generally, but more particularly in connexion with the claim set up by the United States for compensation for the slaves of the Creole liberated by order of the British authorities at Nassau, the particulars of which have already been given in this paper. "The question," says Dr. Channing, "between the American and English Governments turns mainly on one point. The English Government does not recognise within its bounds any property in man. It maintains, that slavery rests wholly in local municipal legislation; that it is an institution not sustained and enforced by the law of nature—and, still more, that it is repugnant to this law; and that, of course, no man who enters the territory, or is placed under the jurisdiction of England, can be regarded as a slave, but must be treated as free. . . . This principle is so plain, that it has been established, and is acted upon among ourselves, and in the neighbouring British provinces. When a slave is brought by his master into Massachusetts, he is pronounced free, on the ground that the law of slavery has no force beyond the state which ordains it; and that the right of every man to liberty is recognised as one of the fundamental laws of the commonwealth. A slave flying from his master to this commonwealth is indeed restored, but not on account of the validity of the legislation of the south on this point, but solely on the ground of a positive provision of the constitution of the United States; and he is delivered, not as a slave, but as a 'person held to service by law in another state.' We should not think for a moment of restoring a slave flying to us from Cuba or Turkey. We recognise no right of a foreign master on this soil. The moment he brings his slave here, his claim vanishes into air; and this takes place because we recognise freedom as the right of every human being." Our space does not allow us to give the whole of the author's arguments on this subject; but the following are the concluding remarks, in which he appeals to the free states on the subject of slavery. "This declaration of national principles cannot be too much lamented and disapproved, for the dishonour it has brought on our country. It openly arrays us as a people against the cause of human freedom. It throws us in the way of the progress of liberal principles through the earth. The grand distinction of our revolution was, that it not only secured the independence of a single nation, but asserted the rights of mankind. It gave to the spirit of freedom an impulse which, notwithstanding the dishonour cast on the cause by the excesses of France, is still acting deeply and broadly on the civilised world. Since that period, a new consciousness of what is due to a human being has been working its way. It has penetrated into despotic states. Even in countries where the individual has no constitutional means of controlling government, personal liberty has a sacredness and protection never known before. Among the triumphs of this spirit of freedom and humanity, one of the most signal is the desire to put an end to slavery. The cry for emancipation swells and spreads from land to land. And whence comes the opposing cry? From St. Petersburgh? From Constantinople? From the gloomy, jealous cabinets of despotism? No; but from Republican America! from that country whose Declaration of Independence was an era in human history! The nations of the earth are beginning to proclaim that slaves shall not breathe their air; that whoever touches their soil shall be free. Republican America alone protests against this reverence for right and humanity, and summons the nations to enforce her laws against the slave!"

Australia.—We have received papers from Sydney to the 20th Jan., from which we learn that the Debenture Bill had been withdrawn from the Legislature by the Governor, who complains of the high rate of interest the banks charge in all their transactions. An insolvent debtors' bill had been introduced, the several clauses of which were under discussion. It is proposed that the estates, as in cases of bankruptcy in England, shall pay the expenses attendant upon the administration of the law. The crops were promising in most of the districts of the interior, and the commercial state of the colony appears to be gradually improving from its late distressed state. Some cessation had taken place in the importation of goods, and the stocks, though still heavy, were gradually clearing off, but sufficient remained in the warehouses to supply the inhabitants for a considerable time. The accounts of the staple articles are satisfactory, and the production of them is on the increase. The comparatively recent location of Hunters' River, from which settlement accounts had been received at Sydney to the 8th Jan. appears to be going on well, and in the last year it sent upwards of 1,200 bales of wool to Sydney by steam vessels alone, exclusive of large quantities forwarded overland or shipped direct to England.

Cape of Good Hope.—We have recent intelligence from this colony. The papers mention that the accounts from Natal were satisfactory. The emigrants, after long consideration, had determined upon pursuing a pacific course; and it was reported that the chief commandant, Pretorious, and some others, had in consequence resigned. It appears also, from letters received from the districts to the north, that several of the Natal emigrants had returned to the colony, ostensibly to visit their friends; and it is stated that the movements of the troops had occasioned an unfavourable feeling in the colony. The 50*l.* wool prize-cup given by the Cape Agricultural Society had been awarded to Mr. William Dickson, as the successful competitor. In consequence of the depressed condition of the wine trade at the Cape, a committee had been appointed to present a memorial to the Legislature, praying for leave to establish distilleries for distilling wine into spirits, and that the stamp duty affecting all distillers should be repealed. Premiums are offered for the best sample of raw sugar made from grapes, in quantities of not less than 100 lbs. Fresh arrivals of settlers were looked for from Germany and other parts of the continent of Europe.

Parliament.

HOUSE OF LORDS.

Monday.—Several petitions were presented; among others one by the Duke of Richmond, from the Vale of Orford, Aberdeenshire, against those parts of the tariff which related to the importation of meat and cattle. The noble Duke expressed alarm at some of the propositions of Government, and considered many of them to be inconsistent with themselves.

Lord Campbell put a question to the Lord Chancellor respecting the practice of locking up passengers travelling by railways. He said he need not refer to the frightful accident which had recently occurred on a railway in a neighbouring country. The French Government had since passed a law forbidding the practice, and he thought a similar regulation should be established in this country; and he hoped that the noble and learned Lord would be able to tell him whether Government had any measure in contemplation upon the subject.

The Lord Chancellor said that he was afraid he could not give a very satisfactory answer upon the subject in the absence of his noble friend, the President of the Board of Trade. He had himself been locked up that morning in one of those carriages, without experiencing any inconvenience; and as far, therefore, as his feeling was concerned, he was not desirous of any alteration.

Tuesday.—After the presentation of petitions, the Earl of Ripon, alluding to the practice of locking up passenger carriages on railways, noticed by Lord Campbell on the previous evening, said, that in consequence of the accident on the Versailles Railroad, he had communicated to the different railroad companies in England the opinion of Government, that the practice of locking both doors of the carriages was unnecessary and dangerous. He had thus used all the powers of Government, and he believed the intimation would not be disregarded by the only company (the Great Western) that now pursued the practice.

The Duke of Richmond presented a petition relative to the importation of foreign cattle, which raised some discussion. He was of opinion that justice had not been done to the agricultural classes.

The Earl of Ripon defended the Tariff, on the ground chiefly that the price of meat, and the demand for it in foreign countries, was such as to preclude the possibility of its importation at a moderate duty injuring the agricultural interests in Great Britain.

The Duke of Richmond animadverted on what he considered the inconsistency of the Tariff in admitting the importation of animals at the same duty without reference to their weight or value.—Earl Fitzwilliam and Lord Kinnaird briefly supported the opinion of the Earl of Ripon, and the subject dropped.

Lord Kinnaird, referring to the distressed state of the country, gave notice that on Thursday next he would move for a select committee of inquiry on the subject. He also intimated that he would move for the production of the Queen's letter, addressed to the clergy, for the purpose of raising subscriptions for the relief of the distress.

The Duke of Wellington said that before moving for the letter, the noble Lord should be perfectly certain that such a letter had been written.

Lord Kinnaird said that his noble friend near him could certify to the fact, because he had heard it read last Sunday at church.—Lord Colborne said, he certainly was in the belief that he had heard such a letter read last Sunday.

The Duke of Wellington said, if there were such a letter, he would offer no objection to the production of a copy of it.

Thursday.—Lord Wharncliffe, in reply to observations by Lord Hatherton on presenting a petition, said that he was aware of the evils resulting from canal navigation on Sundays, and that although, from the state of public business, Government could not undertake to introduce a measure upon the subject during the present Session, they would afford every facility in their power to any noble Lord who should bring forward a measure empowering the proprietors of canals to prevent Sunday trading.

Lord Kinnaird then rose, and, pursuant to notice, moved for a copy of the Queen's letter to the Archbishop of Canterbury, for the purpose of calling on the clergy to aid in raising subscriptions to relieve the existing distress. He animadverted on the ignorance expressed on Tuesday by the Duke of Wellington as to the existence of such a letter, and thought there was great reason to doubt the propriety of the course adopted by Government in issuing such a document at the present time.

The Duke of Wellington explained the circumstances which had prevented him from knowing that the letter had been issued, when the subject had been brought before the House on a previous evening. He frankly confessed, that being absent from town during the recess, he had known nothing of the letter, and said that he took much shame to himself for this neglect of duty. His Grace then briefly vindicated the decision of Government to issue such an appeal, on the ground of the prevalent distress in certain districts; and concluded by saying that he had no objection whatever to the production of the letter. A short conversation ensued, in which several noble Lords joined, and the motion was finally agreed to.

The Lord Chancellor moved, that the House should resolve itself into a committee on the Copyright Bill. Understanding that powerful opposition was about to be offered to the bill, he considered it to be necessary to enter into a history of the law of copyright, which he proceeded to do at great length, and concluded by declaring that he regarded the measure before their Lordships as one of simple justice, less than the persons for whose benefit it was intended were entitled to receive, but as a compromise which had obtained the concurrence of all parties worthy of their Lordships' approbation.

Lord Brougham opposed the measure on several grounds, one of which was that it contained an objectionable retrospective clause. The extension of the period of copyright would be of no use to authors, for booksellers would not give more for a copyright of 42 years than for one of 28. He had obtained a calculation of the comparative value of copyrights for each period, supposing each yielded an annual profit of 100*l.*, and he found that the copyright of 28 years would be worth 730*l.* and that for 42 years only 781*l.* Even this small difference in value would not reach the authors from the booksellers. While, therefore, no benefit would accrue to authors, much disadvantage would result to the public, by keeping up the prices of valuable works, and keeping them out of the hands of the people.

Lord Lyttelton thought the terms of protection granted by the bill insufficient, and said that the arguments of Lord Brougham, however cogent as to authors who sold their works, did not apply to those who retained their copyrights.

The Bishop of London supported the measure. He said there were many cases in which works were gradually rising in their market value, and would be most valuable about the time that the copyright would expire under the present law. In such circumstances, the advantage that should belong to the author's family was frequently appropriated by a speculative bookseller.

Lord Cottenham said he would not oppose the bill, although he doubted whether the proposed addition of 14 years to the term of protection would be beneficial to authors. He thought that the bill should not be argued on the ground of justice or injustice to authors, but on the ground of public interest. He concurred in the general objects of the bill; but he considered its retrospective clauses to be adverse to the public advantage.

Lord Campbell expressed his cordial assent to the principle of the bill. The bill then passed through committee, with the understanding that the clauses might be fully discussed on the bringing up of the report.

Friday.—Lord Wharncliffe stated in reply to Lord Dunally, what precautions had been taken by the Government for the prevention of any general breach of the peace in the county of Tipperary.

Lord Campbell laid on the table a bill for transferring appeals from the Ecclesiastical Courts in Ireland to the House of Lords, which was read a first time.

HOUSE OF COMMONS.

Monday.—Col. Rushbrooke moved that a new writ be issued for the borough of Ipswich, in the room of Messrs. Wason and Rennie, whose elections had been declared void. After a lengthened conversation the issue of the writ was postponed; and Mr. C. Wynn announced that he would on Thursday propose that the Attorney General be directed to prosecute the parties concerned in bribery at the late election for Ipswich.

On the motion for going into committee on the Customs Acts (the Tariff), Mr. Callaghan proposed a resolution for charging on all imported articles of manufacture a duty equivalent to that charged on the raw material of the same articles respectively, with a view, particularly, to the equalization of the duties upon salted provisions and upon live cattle.

Mr. Gladstone said, that the shipowner, fitting out from Ireland, was now paying between 7*l.* and 8*l.* for the same quantity of salt provisions which, 10 or 15 years ago, he obtained for between 4*l.* and 5*l.* Considering the hardship, he must oppose the motion.

Mr. Labouchere and Mr. Roche made a few observations; Sir R. Peel briefly supported the opinions expressed by Mr. Gladstone; and Lord J. Russell declared his intention of supporting in all instances the principle of free competition. Sir R. Fergusson spoke in favour of the motion of Mr. Callaghan, who, however, allowed it to be negatived without a division, and the House went into committee.

Mr. Miles then brought forward the motion of which he had given notice, "that the duties to be levied upon all live stock imported from foreign countries for the purposes of food, be taken by weight." He applauded the financial measure of Sir R. Peel, and claimed credit to the body of county members surrounding the Rt. Hon. Baronet for the steady support they had given him, and for the silent endurance with which they had brooked the taunts of their opponents. But the time for silence was now past, and the season had arrived when a legitimate opposition must be offered. This opposition, however, had no tendency to affect the Administration; for the question was one of detail only. He then entered at great length into calculations of the cost of breeding oxen, sheep, and hogs abroad and at home, inferring the necessity of a better protection to the British farmer, and remonstrating against the lowness of the proposed duty on live, as compared with that on dead meat. He concluded by saying that he asked not for undue but for just protection; and hoped that Sir R. Peel would consent to adopt his amendment. Mr. Palmer (Berkshire), in seconding the motion, declared the alarm at the existing tariff to be very general among the agriculturists. Mr. C. Wyndham (Sussex), was not afraid that the continental states would injure the British farmer by sending cattle into this country; for they had really had no cattle to send. Lord March regretted to differ from his colleague, the previous speaker, whose sentiments he must say, were not those of the county of Sussex. Mr. G. Heathcote supported the amendment, from a conviction of the injurious consequences which would result from the Government proposition.

Mr. Gladstone affirmed that Government had precisely the same object in view as the proposer of the amendment, and they were quite satisfied that no evil consequences would ensue to the British farmer from that part of the proposed tariff which related to cattle. Viewing the state of the country, Sir R. Peel would have failed in his duty had he proposed less than he has done; and as to the alleged alarm which prevailed among the agriculturists, the returns of prices at the late country fairs showed that it was greatly exaggerated. The price of meat had greatly increased in this country, to the diminution of the comforts of the people; and it was the duty of Parliament to check the progress of that increase. His only fear was, that the importation likely to be let in by this tariff would be too small to give the desirable amount of relief. He instanced several of the continental states as consuming cattle to an extent which left them no stock to export. Some had calculated, that in five years the importation would reach 80,000 head per annum; but even that supply would not so meet the demands of our increasing population, according to its recent rate of progression, as to prevent a still further rise of prices. But then it was said, if so little effect would follow, why disturb the existing protection? Because even if the import were not large, it would do good as far as it should go, and would create a demand for our manufactures to a proportionate extent. For these reasons he should oppose the amendment.

Dr. Bowring made various statements in support of the Government proposition, which he regarded as a great and important step towards sound principles in legislation. Lord Norreys said, this motion seemed to be intended for the purpose of getting up an agricultural division, which might soothe the farmers for what had passed about the corn law. He would not be a party to countenance the panic which some agricultural agitators had got up. Mr. Gally Knight ridiculed the notion of any alarming import of cattle from countries whose meat was so inferior to ours, that they durst not exhibit it in the shape of a joint. He would, therefore, lend no hand to embarrass the Government, or to open the way for the return of the loose and dangerous Ministry of last year. After a few remarks from Lord Alford in opposition to the amendment, and Mr. O. Stanley in support of it,

Lord J. Russell contrasted the arguments of those who opposed and those who supported the amendment; and said he regarded the speech of Mr. Miles as most convincing against his amendment. Surely the wisdom of Parliament did not consist in legislating against the welfare of the community, and compelling them to pay a higher price for meat than they otherwise might. Increase the comforts of the working classes, and the agricultural interest would derive its advantage from the improved condition of the country. But he could not reconcile Sir R. Peel's present measure with his conduct on other matters, particularly on the corn-law. If cheap fish and cheap meat were a great benefit, why not cheap corn? and yet, as to corn, the great object had been to prevent its cheapness. After entering at length into the details of the Government measure, the noble Lord concluded by saying, "on the whole, therefore, while I agree in the general grounds of the Tariff, I cannot assent to some of its proposals. I cannot see that its practical benefit will be so great as the hon. gentleman who moved this amendment would represent. I cannot see that the admission of cattle will immediately take place to a great extent; but I think it of great value as the assertion of a principle. It is, in the first place, putting an end to prohibition; in the next place, it is apportioning a fixed and moderate duty to great articles of consumption: but when the hon. gentleman, who has given notice of a motion for making the duty on cattle equal to that on corn, shall submit his motion, I shall be inclined to assent to it, with this slight difference, that I shall endeavour to bring down the duty on corn to the proportion of that imposed on cattle. Entirely agreeing with the present proposal, and hoping that the Government will apply their principle to all articles, without fear or affection, I shall support them against the proposition of the hon. gentleman."

Sir R. Peel observed, that Lord J. Russell himself had not, as might have been supposed from the speech he had now delivered, been the advocate of the cheapest possible supply of food; on the contrary, the noble Lord had proposed a protection, in the shape of an 8*s.* duty. The Rt. Hon. Baronet then proceeded to express his gratitude to the mover and those who concurred in the motion, for the generous confidence with which they had honoured him, and which he trusted and believed would survive the difference of that night. With respect to this particular topic, he was happy to observe that the panic was declining, and the price of live stock rising. All the modern improvements in steam navigation had failed to lower the markets in London or in Liverpool. The new inlet would not lower them; it would, at best, be only a prevention of further advance. Three things were always forgotten—the quantity of the continental article, its quality, and that rise of its price abroad which its admission must of itself occasion. It would be highly beneficial to England to obtain free access to some of the improved breeds of cattle on the continent. The interests of the community imperatively demanded the change now proposed, and the apprehensions entertained respecting it were perfectly groundless. He had not yet yielded to the solicitations of many esteemed friends, who had waited on him to ask for increased protection, for his conscientious belief was that a duty of 1*l.* per head was amply sufficient; and he was of opinion that the population of this country was increasing at a rate more alarming and more rapidly than many were aware of. "My interests," he said, "are connected with those of the agricultural body, and I would not knowingly do anything which would prove injurious to them. I think, however, that by agreeing to the proposal of my hon. friend the agricultural interest would attract to itself a great deal of superfluous and unnecessary odium. I deeply regret being compelled to differ from many of my agricultural friends; but I am perfectly convinced that the interests of the consumer require that increased facilities should be afforded for the importation of cattle; and I say with regret that I can make no concession upon the present occasion, but must adhere to the proposal I have made, and which I trust the House will by a large majority affirm."

Mr. M. J. O'Connell approved of the admission of cattle; and wished the principle had been applied to corn.—Lord Worsley supported Mr. Miles's motion.—Mr. Villiers could not treat with respect a motion to check relief, at a season when the people were starving. The discussion, however, had done this good, that it had extorted an admission of the people's sufferings.—Mr. F. Scott replied to the insinuations of the preceding speaker in reference to the Corn-laws; and after some observations from Mr. Ward against the amendment, Mr. O. Gore said he had that morning come up from Shropshire, where he had left the farmers perfectly satisfied with the proposal of Sir R. Peel. The panic had entirely ceased there.—Mr. Hume supported the duty as proposed in the Tariff. The present motion, he considered, went only to add to the public misery. The people wanted cheaper food; corn should be made cheaper. Distress was never so general as now. He maintained that the whole proceeding of the House was to starve the people.—Mr. Miles replied; after which the Committee divided, when there appeared for the duty as in the Tariff, 380; for Mr. Miles's proposal, 113; majority for Ministers, 267.

It was arranged that the third reading of the Income-tax Bill should be deferred until Monday, and that of the Poor-law Continuance Bill until Tuesday next; after which Mr. Roebuck brought in his Indemnity Bill, which was read a first time without remark.

Tuesday.—The Feversham Navigation Bill was read a third time and passed.

Mr. Scarlett moved the order of the day for the further consideration of the report on the Haddingtonshire Roads Bill.—After some discussion the House divided:—For the original motion, 46; for the amendment, 64. The Bill was consequently lost.

Mr. O'Connell notified to the House that he had made his election to sit for Cork county; and, therefore, moved that a new writ be issued for Meath, which was agreed to.

Mr. G. Palmer gave notice that in committee on the tariff he should move that the present duty on foreign vegetables be retained.

Sir R. Peel took occasion to say, with reference to a question put to him some time since by Mr. Hume, respecting Capt. Elliot, late British plenipotentiary in China, that whatever opinions he might have expressed or entertained respecting that officer's conduct in the extremely difficult position in which he was placed in Canton, the interviews he had had with him since his return led him to place every confidence in his integrity and ability to perform his functions.

The House then went into committee on the Tariff.—Mr. Miles explained, that his view, in his motion of the preceding night, had been to arrive at a duty of 5s. 6d. per cwt. of live meat: which he would now move as an amendment on the proposal of Government.

Sir R. Peel opposed it, and repeated shortly his objections to Mr. Miles's motion of the previous evening.

Mr. Pusey suggested as an amendment to the proposal of a duty on live cattle per head, the appointment of a select committee to investigate the matter.

Sir R. Peel said he could not concede a committee on this subject without conceding a committee on every other disputed point of the Tariff.

After a few words from Col. Wood and Mr. Gibson, against Mr. Miles's resolution, Mr. Palmer (Berkshire) said he concurred in it for the reasons he had stated on the preceding night.—Mr. Ward condemned the proposition as an insidious attempt at a compromise in a case where public duty forbade any compromise at all. Upon every question in this Tariff where an attempt should be made to neutralize general interests for particular ones, he said he would place himself at the disposal of Government.—Mr. Buck was afraid that the Tariff was paving the way to a system disastrous to the best interests of the country.—After some observations from Mr. W. O. Stanley and Col. Wood, Mr. Villiers expressed his fear that the remission proposed by Government would produce but little effect.—Mr. Escott supported the proposal of Government: and Mr. R. Yorke stated that an advertisement which had appeared in Yorkshire, and had excited some attention, for supplying beef at 3d. per pound from Hamburgh, was intended only as a joke, to practise on the credulity of the agriculturists.

Lord J. Russell said, this was not more monstrous than the story about the amount of corn which Russian Tamboff had been represented as likely to produce. The relief really wanted was an alteration in the corn laws.

Sir R. Peel showed that the exaggerated estimates formed respecting the amount of corn which Tamboff would be capable of pouring in upon this country, had arisen from an oversight on the part of the late Ministers in publishing a paper without due examination of its contents.—The Committee then divided, and Mr. Miles's amendment was negatived by a majority of 209 to 44.

Major Vivian then moved to equalize the duty on Canadian cattle and provisions with the duty on the like articles imported from foreign countries.

Sir R. Peel refused his assent; and after a short debate, in which Mr. C. Buller, Lord Howick and Mr. Labouchere joined, the motion was withdrawn.

The duties were then voted on various articles, till the Committee came to the item of swine and hogs, when Mr. S. O'Brien moved to substitute for the proposed uniform duty of 5s. per head, a duty of 4s. per cwt. This protection he desired for the sake of the poorer classes in Ireland, who bred this description of stock.—Mr. Miles briefly seconded this amendment, which was negatived on a division by 121 to 32.

The Chairman then proceeded, proposing successively the different items of the tariff. At the article "fish," some debate arose as to the proposed duty on lobsters, which are at present admitted duty-free; and Sir R. Peel, partly from the representations of Major Beresford on behalf of the lobster fisheries of Harwich, and partly from an assurance of Mr. Wakley, that the chief consumption of this fish is by the middle and working classes, consented to reconsider the intended impost.—Another discussion arose as to turbots, which also are at present free of duty. But turbot being an article consumed almost exclusively by the rich, Sir R. Peel refused to give way in this instance.

Sir R. Peel, in answer to an inquiry of Mr. C. Buller, why salmon was subjected to a duty of 10*s*. per cwt., while other fish were charged with only 5s., said that the other fish were sea fish, while the salmon fishery was a river fishery, in which, on the faith of the prohibition hitherto prevailing, long leases had been taken, and large capital invested by individuals, by corporations, and by charities.—Mr. Gladstone observed, that 10*s*. was a lower duty on the value of salmon than 5*s*. on the value of soles.

Under the head of "fruit," Mr. Baring brought forward a remonstrance against the increase in the duty on apples.

Sir E. Knatchbull explained, that a diminution of that protection had been made by the late Government in their Customs' Bill without notice; that the new enactment remained undiscovered till the bill reached the Lords; that, upon a resistance there, Lord Melbourne promised, or was understood as having promised, to readjust the duty in the following year; but that, this redress never having been afforded, the protection was partly restored in the present scheme.

Mr. Gladstone said that cherries and currants would come in at the low duty, because they were perishable fruits. He admitted that, on the lower qualities of apples, the duty of 6*d*. the bushel would be heavy; but his belief was that, practically, this duty would attach only on apples of medium quality: apples of the lower class were not imported from France. With regard to the 5 per cent. duty, that had been left an open question. Lord Melbourne had expressed his intention, when the alteration to 5 per cent. was proposed, to have the matter reconsidered in the next session; and the present Government therefore found themselves bound to redeem the pledge which their predecessors had given.

Mr. Wakley opposed any alteration of the existing law, on the ground that, with the exception of Kent, no other apple-producing county called for it. Government should consider that apples constituted one of the luxuries of the poor, and that it was, therefore, unfair to increase the duty from 5 to 20, and, in some instances, 40 per cent.

Sir R. Peel said that he had considered the subject maturely. He had received earnest representations against continuing the low duty on foreign apples; but still he did not at all undervalue the importance of the subject, or mean to deny that apples constituted one of the luxuries of the poor. On this ground he felt unwillingness to increase the duty, but, at the same time, he felt bound to fulfil the engagements of the late Government.

Lord J. Russell said that Lord Melbourne's colleagues had not understood the late Government as having come under any pledge on this subject, except to reconsider it. It had been reconsidered by a committeee, which took evidence; and the result of that evidence was, that the change had been generally beneficial to the consumer, without any ruinous effect upon the grower. With respect to the discouragement of orchards, it did not appear that the existing duty had produced the effect of preventing the planting of new orchards in some parts of the country.

Mr. Wakley moved, as an amendment, that the words "five per cent. *ad valorem*," should be substituted for the duty of 6*d*. per bushel proposed in the tariff.—After a short conversation, the committee divided, and there appeared: For the amendment, 51; against it, 110. The resolution was then agreed to, as was also the remaining duties in the same schedule.—The Chairman then reported progress, and the House resumed.

The Incumbents' Leasing (No. 2) Bill was read a third time and passed.

Wednesday.—After the presentation of petitions, the subject of locking-up passenger carriages on railways was introduced by Sir R. H. Inglis, and Mr. Gladstone intimated that he had reason to think that the directors of the Great Western Railway would cause the practice to be given up.

The Committee on the Tariff was then resumed. Lord Howick proposed that the import duty on foreign butter should be reduced from 20*s*. per cwt. to 10*s*., leaving the duty on colonial butter at 5*s*., as imposed in the tariff.

Sir R. Peel objected to this reduction, which, he said, would work a serious loss of revenue. He remarked it as inconsistent with the anti-differential doctrines advanced on a former evening by Lord Howick, that the noble Lord, in now proposing to alter the duty on foreign butter should himself have made a difference between the foreign and the colonial article.

Some of the country gentlemen represented the necessity of keeping up the protection of the small dairymen.—Mr. C. Buller thought it much more important to provide cheap food for the poor population.

Lord J. Russell was resolved to take this opportunity of supporting Sir R. Peel's general principles of free trade against Sir R. Peel himself.—The Committee then divided, when there appeared for the amendment 59; against it 115.

Some discussion then followed respecting the duty on cheese, which it was proposed by Mr. M. Philips to reduce from the 10*s*. 6*d*. proposed on the tariff to 7*s*. 6*d*.—Mr. Labouchere referred to a Cheshire newspaper, in which the high rate of duty preserved in the tariff on this article was ascribed to the influential exertions of the county Members with Government.

Sir R. Peel assured the Committee that the decision of Government had been taken upon considerations of revenue, before the county Members had brought in any application whatever.

After some observations from Messrs. Hume, Cobden, Wakley, and Ward, all of whom inveighed against the agricultural party, who they said resisted the relief of the starving people for the sake of their own interests,—Mr. Jervis said that though generally favourable to free trade, he would support the protection of cheese, on a mere comparative question between 7*s*. 6*d*. and 10*s*. 6*d*.

Sir R. Peel regarded the preceding speech as a strong illustration of the difficulty of his task. Mr. Jervis was making an exception in favour of cheese, as being Member for Chester; and thus it was that each man thwarted the Government measure in the particular matter that touched his own constituents. This showed how necessary it was, instead of dividing on these single items, to take the tariff as a whole; and he believed the wisest thing the House could do would be to pass the entire measure that very night. The Committee then divided, and negatived Mr. Philips's amendment by a majority of 82 to 37.

Mr. Palmer, of Essex, moved to raise the proposed duty upon onions from 6*d*. to 1*s*. per bushel.—Mr. Gladstone resisted this, as unreasonable in amount and unnecessary for revenue.—Mr. Palmer refrained from pressing his amendment to a division; but moved to raise the duty on potatoes from 2*d*. per cwt. to a shilling. And this he desired, not for the sake of rents, but in order to keep the country independent of foreigners for this great article of food. The Ministers, before their accession to office, had held out expectations of full protection to agriculture; and the agriculturists were not to be blamed if they now required the fulfilment of that pledge.

Mr. Gladstone represented the great importance of providing for the importation of potatoes in time of scarcity. The consumer of wheat could fall back on oats, of oats upon potatoes; but the consumer of potatoes could fall back upon nothing. Still the ordinary importation of them was greatly checked by their bulk and the consequent dearness of freight.

After a few remarks from Mr. Wakley, in support of the amendment; and from Messrs. Escott, S. Wortley, and Beckett against it, Mr. Palmer withdrew it.

The schedule of duties upon food having been disposed of, the schedules relating to spices, seeds, and woods were passed without opposition; and the Committee then came to the schedule affecting minerals, on which Mr. Turner raised a long discussion in reference to the mining interests of Cornwall, and concluded by moving the omission of the words upon which his objections were founded.—Mr. Gladstone opposed the amendment, and explained the peculiar advantages which it was expected the adoption of the proposed rate of duty would confer upon those engaged in smelting the metal.—Sir C. Lemon spoke in favour of Mr. Turner's amendment, and the Committee divided, when there appeared for the amendment 7; against it 158.

The Committee then proceeded with the other descriptions of ores, the proposed changes in the duties upon which were agreed to without much discussion.

Thursday.—After some preliminary business of little interest, Mr. Wynn, pursuant to notice, brought on his motion for a direction to the Attorney-General to prosecute such persons as shall appear to him to have been guilty of bribery at the last election for Ipswich.

Sir T. Wilde opposed the motion, which he said he did reluctantly. He thought it would be infinitely preferable to introduce a general measure for the suppression of bribery, than to select individuals for punishment in one or two isolated cases. The sympathy manifested by the House towards individuals brought before it on charges connected with inquiries into bribery, was also a strong reason for not proceeding against individuals in a way which might appear merely vindictive.

Sir W. Follett also opposed the motion. He thought it was not expedient to give a general direction to the Attorney-General, leaving him to exercise his discretion; he should receive special instructions, according to the usual custom of the House, to prosecute particular individuals.

Lord J. Russell alluded to the conduct of the House in the case of Mabson, committed by the Southampton Committee, as a proof of the disposition of the House to screen bribery transactions.

Mr. Thesiger vindicated his conduct in that case, and explained his motives in procuring the meeting of the House on a Saturday for the purpose of the release of Mabson. After a short conversation on this subject, and some remarks from Mr. T. Duncombe against the motion before the House,

Mr. O'Connell called on the Attorney-General to bring in, on the part of Government, a bill of indemnity for witnesses, by which all bribery cases could be probed to the bottom, and the wealthy bribers reached. If this were not done, the country would give no credit to any expression of anxiety to put down bribery.

Sir R. Peel said, by all means punish the bribers, but do not set up the dangerous practice of screening the bribed. Confessing the difficulty of the case, he thought it best, on the whole, not to direct a prosecution in the present instance, though he came to this conclusion with reluctance. He had not had much time to attend to election committee proceedings during the present session; but from an inspection of the Ipswich and Southampton reports, he could not draw any unfavourable conclusions against the tribunal constituted by the House for the trial of controverted elections

Several other members spoke against the motion, which was finally withdrawn.

Col. Rushbrooke then moved the issue of a new writ for Ipswich.—Mr. Hume objected to the motion, and hoped that the writ would be suspended for a month, pending the proposed inquiries.

Sir R. Peel did not see sufficient grounds for the suspension of the writ.

Lord J. Russell said that the power of suspending a writ, on the ground of bribery and corruption, had been repeatedly exercised since the time of the Revolution: and though he should use the power with reluctance, yet there were cases in which it was advisable to do so. It seemed advisable to him, under all the circumstances, to suspend the writ.

A long and animated debate ensued, the speakers on one side of the House contending that the continued suspension of the writ involved a constitutional right, and those on the other, that an inquiry into and a prevention of bribery and corruption was of more importance. Mr. Aglionby, Mr. Hawes, and Sir T. Wilde addressed the House against the issue of the writ, and Lord Stanley and Mr. H. Hinde in favour of it

After some observations from Mr. R. Yorke, on the subject of bribery, Mr. Ferrand said there was a rumour abroad that Mr. R. Yorke had spent thousands of pounds in corrupting the electors of the city of York.—Mr. R. Yorke replied, that if the House would appoint an inquiry into the circumstances of the last election, he would lend it all the assistance in his power.—After a few observations from Mr. Wynn and Col. Rushbrooke, the House divided, when there appeared—For the issue of the writ 126; for its suspension for one month, 107. Majority, 19.

Mr. O'Connell then moved, as an amendment on the motion for the issue of the writ, that a select committee of inquiry be appointed to inquire into the extent of bribery at the last Ipswich election; upon which another discussion arose.

Sir R. Peel, disclaiming all feeling of participation in any sympathy for corrupt proceedings, begged the House to beware how it interfered with the rights of constituents, as there might be no limit to the extent to which a majority might be disposed to go.—After some remarks from several other members, the House again divided, when there appeared—For the issue of the writ, 133; for the committee of inquiry, 119. Majority, 14.

Lord Stanley obtained leave to bring in two bills; one to provide for the Government of Newfoundland; and the other to make further provisions for the Government of New South Wales.

The Witnesses Indemnity Bill was read a second time, on the motion of Mr. Roebuck, after some alterations had been suggested by Sir R. Inglis and Sir R. Peel.

Friday.—The Income Tax Bill was read a third time *pro formâ*, various amendments being ordered to be printed with a view to a final discussion on Monday. The Tariff was then resumed. A division took place on an amendment proposed by Mr. Lyall for postponing the operation of the new duties on train oil for two years, and on sperm oil for three years, when the amendment was rejected by 108 to 41. On the timber duties a discussion arose as to the proposed mode of admeasurement by which the duty is to be levied. Sir R. Peel promised that further inquiry should be made, and if it should appear that there is any obstacle, another mode of admeasurement will be adopted. However, Sir R. Peel guarded himself from consenting to any alteration which will affect the duty.

Mr. C. Buller brought on his motion in reference to the petition of Mr. Warburton and the late Bridport election, and stated that besides the compromise of the seat no less than fifty-one actions for bribery had been compromised, the penalties in which would have amounted to 25,000*l*.—He was followed by Mr. Cochrane and Mr. Mitchell, the sitting members, who addressed the House at considerable length.—Sir T. Wilde thought that the statements of both members amply warranted the House in referring the petition to a committee; and after a discussion, in which Sir R. Peel, Lord J. Russell, Sir R. Inglis, Lord Palmerston, and Lord Stanley took part, a division took place, giving 156 for the inquiry, and 37 against it.

CITY.

Money Market, Friday.—Consols for money are quoted 92½ to ⅝; for the account, 93⅛ to ¼; Bank Stock, 167 to 168; India Stock, 249½ to 251; Exchequer-bills, 37s. to 39s. premium; Three per Cents. Reduced, 91⅝ to ¾; Three-and-a-half per Cents. Reduced, 100 to ⅛; and New Three-and-a-half per Cents., 101 to ⅛.

Metropolis and its Vicinity.

Metropolitan Improvements.—Within the last few days a new bridge over the piece of ornamental water leading from the inner circle in the Regent's-park, across the park to Macclesfield-gate, has been opened to the public, and there are now two other bridges in course of erection, which, when completed, will facilitate the visits of the inhabitants of the Metropolis to Primrose-hill.—Considerable improvements are at present making in the narrowest part of Upper Thames-street, near Queenhithe, where it has hitherto been so confined as to be impassable for two carriages abreast. The whole frontage of several large warehouses, upwards of seven stories in height, and which project into the street for nearly twenty feet, have been pulled down, and new fronts are erecting on a line with the other buildings, whereby the appearance of the street will be greatly improved, and sufficient room afforded for the passage of vehicles.—The contemplated improvements in Piccadilly have been postponed until the ensuing autumn, in consequence of some difficulties on the subject which have arisen on the part of St. Martin's-in-the-Fields, whose limits extend to the basin in the Green-park. It is, however, said that the parish of St. George, Hanover-square, are willing to accede to the proposals of the Commissioners of Woods and Forests to facilitate the widening of the street, and that there is no doubt that this improvement, though suspended for a time, will ultimately be carried into effect.

Spitalfields Ball.—The ball for the relief of the distressed weavers of Spitalfields, the announcement of which has for some time created considerable interest, took place at the Opera House on Thursday evening, and was one of the most attractive sights presented to the public for many years. The interior of the theatre was converted into a saloon for the occasion; a flooring being thrown over the pit, which was brought to a level with the stage; in the midst of which was the orchestra. All the machinery was removed from the stage, which, by the aid of drapery, was made to assume the appearance of a spacious tent, supported by Corinthian pillars. In the back, against the wall, was a group of polished armour and stands of colours, brought from the Tower for the purpose. At the opposite side of the house, facing the stage, was the Royal box, constructed in the form of a Corinthian portico, and handsomely decorated. The entire body of the theatre was festooned with rich silk draperies, interspersed with garlands of flowers; and the general appearance of the house was brilliant and imposing. The company began to arrive at nine, and by ten the floor of the theatre as well as the various boxes was filled. Some few fancy dresses appeared, but they were not general; the report that the Queen would appear in the costume worn by her Majesty at the fancy ball given at Buckingham Palace, having been incorrect. Her Majesty and Prince Albert, with the other members of the Royal family, and a numerous suite arrived about half-past ten. The dancing then commenced, and was kept up with much spirit. During the evening the ladies patronesses of the ball, and several other ladies, were introduced and presented to her Majesty. Her Majesty remained until after twelve, when accompanied by the members of the Royal family and her suite, she retired amid the enthusiastic cheers of the company.

The Tower.—A few evenings since, in moving the ordnance estimates in the House of Commons, Capt. Boldero alluded to the late fire in the Tower, and said that the destruction of small arms on that occasion rendered an additional grant of 50,000*l.* necessary for that department of the service. Having touched upon the subject of the fire, he said it would be a favourable opportunity for disabusing the public mind of the erroneous impressions that had prevailed as to the amount of the loss. He had seen it stated at various sums, from half a million to 250,000*l.* Perhaps it would be some satisfaction to the House if he stated that the whole amount of loss to be provided for by the public, scarcely exceeded the half of the last sum he had mentioned, or 128,000*l.* At the time of the fire, there were in the Tower 94,520 stand of arms; about 4,000 were saved, and 12,006 were, before the fire, in a useless state; the number consumed was 78,500. The entire value of the property in the Tower previous to the fire was 168,000*l.*; they had saved a little more than 10,000*l.* worth, and had lost upwards of 30,000*l.* worth in the shape of ornaments and trophies. The entire loss had been about 128,000*l.*

Trinity House.—Monday being Trinity Monday, the master, wardens, and elder brethren of the corporation of the Trinity proceeded from the Trinity-house, on Tower-hill, and embarked at the Tower-wharf-stairs, in their state barges, for Deptford, on their annual visit of inspection to the Trinity-house of Deptford Strond, or Hospital, at Deptford, incorporated by Henry VIII., and the more modern structure called Trinity Hospital, for decayed pilots, or masters of ships, and their widows. The inmates met the corporation at Deptford-stairs, and walked in procession to St. Nicholas Old Church, where an appropriate sermon was preached; the election of a master for the ensuing year then took place in the hall of the hospital. The Duke of Wellington, who has held that office for several years, was re-elected. After the customary distribution of buns and favours to the people, the corporation returned in the same state to the Trinity House, on Tower-hill, where a banquet was given, to which a number of distinguished individuals were invited. The corporation, headed by the Duke of Wellington, and attended by a guard of honour, the wardens of the Tower, and other functionaries, left the Trinity-house about 11; and the procession on land as well as the display on the river attracted a great number of spectators.

Public Meetings.—A meeting of the merchants, bankers, and traders of the City has been held for the purpose of considering the propriety of adopting measures to relieve the unfortunate sufferers by the late conflagration at Hamburgh. The Lord Mayor took the chair, and briefly introduced the object of the meeting. He said that he did not doubt that his fellow citizens would respond to the call made on their humanity for the relief of the distressed. Mr. Colquhoun, Minister for the Hanse Towns, addressed the meeting at great length, and read an official despatch from the Syndic of Hamburgh, giving a detailed account of the circumstances attending the calamity, which, it stated, could only be compared to the fire of London, or the earthquake at Lisbon. Mr. Colquhoun concluded by stating that among the many motives that should incite the people of England to render every aid to the people of Hamburgh, was the fact of their having a common origin, sprung as they both were from the ancient Saxons. Mr. T. Baring in a brief speech then proposed the first resolution:—"That this meeting has heard with unfeigned sorrow the afflicting intelligence of the late disastrous conflagration at Hamburgh, a city connected from the earliest period in commercial relations with Great Britain, by which so large a portion of the town has been reduced to ashes, heavy losses sustained, and some thousands of human beings reduced to a state of destitution." Mr. M. Attwood seconded the resolution, and it was adopted unanimously. Several other resolutions were then proposed and carried, of which the following is the substance:—That the uniform liberality of the people of Hamburgh towards British subjects visiting that city, entitle the inhabitants, suffering from the recent calamity, to the peculiar sympathy of the British public. That the thanks of the meeting be dutifully tendered to the Queen, Prince Albert, and the Queen Dowager, for their sanction and assistance on this occasion. That the thanks of the meeting be also given to Government for their ready supply of tents and blankets from the public stores, and to those public bodies which have already set a laudable example by their liberality on this occasion; and, lastly, that the public at large be solicited to co-operate towards creating a fund, which may in some degree prove adequate to the extent and severity of the sufferings which it is intended to relieve. The principal speakers were Mr. Jones Lloyd, Deputy Governor of the Bank of England, Mr. J. J. Gurney, Sir J. Rae Reid, and Sir M. Montefiore. It was also resolved that subscription books be opened at the London and country bankers; and a committee was appointed to carry into effect the objects of the meeting. —The twenty-fourth annual general meeting of the society for promoting the enlargement building and repairing of churches and chapels was held on Monday, the Archbishop of Canterbury in the chair. The report stated that since the publication of the last report application had been made to the society, from various parts of England and Wales, for assistance towards the repair, enlargement, and building of churches and chapels in populous places. In consequence of those applications 143 grants had been voted of sums varying according to the circumstances of the several cases, and provision had been made for the accommodation of 41,554 persons, of whom 30,041 would have the privilege of attending divine service without cost. The sum thus voted amounted to 19,090*l.*, being less than the votes of the preceding year by 3,453*l.*, while the increase of accommodation given had been in proportion greater; for, in 1841, accommodation had been provided for 45,757 persons at a cost of 22,543*l.*, while in the past year the number had been 41,554, and at a cost to the society of 19,090*l.* The present amount of grants of the society remaining unpaid, or liable to be called for, was 50,985*l.*, and the sum in possession for the purpose of meeting it 47,759*l.*, showing a deficiency of 3,226*l.* The report was adopted.

Wood Pavement.—At a meeting of the Marylebone vestry held on Saturday, a memorial was presented from the Metropolitan Wood Paving Company, containing the opinion of the Attorney General and other eminent counsel in reply to a memorial presented to the vestry from Mr. Stead, who claimed to be the original inventor of wood-paving, and who has charged the Metropolitan Company with an infringement of his patent rights. The opinion of the Attorney General was in favour of the company. A memorial was also presented, praying to be permitted to lay down Saunders's patent wood-paving, which is a new specimen, to the extent of 1,500 yards in Oxford-street, as an experiment, for 12 months, free of charge, and if approved of at the end of that period, to be supplied at the rate of 12s. per square yard. On this, Mr. Harbut moved a resolution that no further applications, with respect to wood-paving, be entertained until the expiration of the present contract with the Metropolitan Patent Wood-paving Company, and that the durability of wood, as a paving, has been fully tested. A long discussion ensued, and ultimately the motion was carried. On Thursday, a meeting of the inhabitants of Oxford-street took place for the purpose of considering the conduct of the Marylebone vestry in adopting the above resolution. Several inhabitants of Oxford-street addressed the meeting on the injury and injustice done to them and the ratepayers generally, by the conduct of the vestry; and resolutions were adopted, declaring that the suspension of wood paving for three years, without any previous notice to the great body of the vestrymen, was a breach of faith, and that the majority by which it was carried were unworthy of being the representatives of so important a parish.

Mortality of the Metropolis.—The following is the number of deaths in the Metropolis from all causes, registered in the week ending Saturday, the 14th inst:—Males, 392; Females, 381; total, 773. Weekly average 1838-9-40-1—Males, 467; Females, 445; total, 912.

Police.—On Monday morning, Daniel Good underwent the last penalty of the law at Newgate. The crowd of persons assembled to witness the execution was greater than has been known on a similar occasion since the execution of Fauntleroy. The convict made no confession, but denied his guilt to the last.

Fires.—A fire broke out on Wednesday in the extensive distillery of Sir F. Booth, at old Brentford. Fortunately it was soon discovered before it had made much progress, and the flames were easily subdued. It is stated that there were at the time in the different buildings, which are of great extent, nearly 500 head of cattle, and grain to the value of from 10,000*l.* to 12,000*l.* There seems to be reason to suspect that the fire was the act of an incendiary, but it has not yet been traced to any party.

Provincial News.

Birmingham.—At the borough sessions in this town on Saturday a woman named Ann Mills, the Edgbaston letter-carrier, was sentenced to six months' imprisonment, for detaining and opening certain letters which it was her duty to have delivered. The letters which were found concealed between the mattress and her bed, and which she had opened, were all addressed to ladies. The Recorder said that he hoped the punishment would be a sufficient check to the indolence or curiosity of others. It did not appear that she had opened the letters to obtain money, or her sentence would have been much more severe.

Cambridge.—The local papers inform us that Archdeacon Wrangham has presented a valuable collection of tracts, amounting to upwards of 8,000, in about a thousand volumes, to Trinity College, in this University. It is also stated that Messrs. Rundell, Bridge, and Co., of London, whose intention of soon retiring from business has been announced, have presented to this University and to that of Oxford, a cast in bronze of the far-famed shield of Achilles, the composition of the late great sculptor, John Flaxman, R.A. A correspondent informs us that at St. Peter's College, on the 21st, prizes were adjudged, in classics, to Messrs. Stow, Suffield, and Thomson, Æq.; in mathematics, to Mr. Thompson; and for classical composition, to Mr. Smith. On the 24th, Messrs. Dickinson, Fitzpatrick, Golding, Parry, Smith, Stow, Suffield, and Thomson, were elected scholars.

Falmouth.—A numerous meeting of the mining interest of this county was held in this town on Monday, for the purpose of receiving the report of the deputation appointed at Redruth some weeks ago to wait on Government, to endeavour to obtain a better protection for British ores, metals, &c., than that afforded by the pending tariff. The report having been submitted, regret was generally expressed that no better result had been obtained than the substitution of a sliding scale on the importation of copper, and a change from an *ad valorem* duty on ore to a tonnage duty on metal, and a trifling additional duty on tin. It was ultimately resolved that the deputation should be requested to continue their labours to draw up a still stronger memorial, and present it again in person to Government, in the hope that, as the question seriously affects the interest of this county generally, and might be the means of suspending a large portion of mining operations if not made more protective, Ministers would reconsider the points laid before them. The petitioners were of opinion that the objects of their application might be granted without incurring any risk of the foreign miner sending his ores to any other place than England to smelt and manufacture.

Maidstone.—A vestry meeting, which was numerously attended, has been held at All Saint's Church in this town for the purpose of considering the propriety of making a church-rate. The Mayor presided. Mr. Watts, one of the churchwardens, then said, that having entered into an estimate of the amount of money they should require in their office to carry them through the year, he begged to move, in order to raise a sum which would cover it, a rate of threepence in the pound. The motion having been seconded, Mr. Stephens rose and said he felt it his duty to move an amendment, "That the application now made by the churchwardens for a rate of threepence in the pound be not granted." A long debate ensued, several persons present speaking against the principle of church-rates; after which the mayor put the motion for the rate to the meeting, when there appeared a large majority against it; and it was accordingly declared to be lost. A poll was then demanded, which will take place in a few days.

Manchester.—We have noticed in a former Number that the meeting of the British Association this year will be held in this town on the 23d June. It is now officially announced that the general committee will meet on the 22d, for the election of sectional officers, and the despatch of business usually brought before that body. On this occasion it is said that the report of the council, embodying their proceedings during the past year, will specially call attention to a plan which has been laid before them for occupying the late Royal Observatory in Richmond Park, for the purpose of experimental inquiries in physical science recommended by the Association.

Newcastle.—Intelligence has been received at Lloyd's of the loss by fire of the ship Georgia of this port, an Indiaman, while on her passage from Calcutta to London. It appears that appearances of fire in the hold were first discovered early in the morning of the 1st of April, when in lat. 30° south, and longitude 36° east, about 900 miles from the island of Madagascar. Active exertions were immediately used to extinguish them, but unsuccessfully; and in a short time the whole ship was in flames. The captain and crew, amounting in all to 15 persons, then took to the boats, though it was very rough and a gale of wind blowing at the time. The boat containing the captain and four of the crew soon after foundered, and all in her perished; but the other boat, in which were the chief mate and nine men, was fortunately picked up by a ship, the Thomas Sparks, which fortunately hove in sight, and attracted by the flames of the burning vessel bore down to their assistance. The Georgia burnt to the water's edge and then sunk. She had a rich cargo on board, consisting of jewellery, merchandise, and other valuable property, which perished with the vessel; a loss in total of nearly 20,000*l.*

Newport (Isle of Wight).—Some excitement has again been produced in this town, in connexion with the church-rate question. A vestry was called a few days since at St. Thomas's Church, for the purpose of granting a rate for the poor, and making a church-rate. Mr. S. Pring, as senior warden, having been proposed to the chair, mentioned the object of the meeting, which was to make a rate for the poor as well as the church. The Rev. Mr. Spence inquired, if a small rate were granted, what extra sum would be required to be advanced from other sources? The chairman said 1,000*l.* would be advanced to afford extra church accommodation, and a rate amounting to 300*l.* would complete the repairs. Mr. J. Cooke said, he understood that at the last meeting the question was not again to be discussed for six months. The chairman said the last refusal of the rate was made in July 1841, and it was absolutely necessary that a rate must be refused before any voluntary contributions could be admitted. A long debate ensued, which terminated by an amendment being proposed, refusing the rate; and on its being put to the vote, it was declared to be carried by a large majority. A poll was demanded, which was to take place forthwith, but the result has not yet been published.

Preston.—A local paper states that in the course of last week a field of hay, in ripe and excellent condition, was cut by Mr. Nicholson, of Ingrol Lodge, near this town, for the second time this season, the first, which was a fair crop, having been cut about five weeks ago. The grass last cut is said to have been very abundant, thick-set, and about fourteen inches high. It seems that during the last season the same field was mown four times, and the season before, five times.

Southampton.—A memorial from the mayor and principal merchants and traders of this town was recently presented to the Lords of the Treasury, praying that the privilege of importing and warehousing silk manufactures and tobacco under bond might be extended to this port. It is now announced that the application has been assented to, on the usual condition of suitable premises being provided for that purpose.

Stafford.—A local paper states that it is estimated that in the coal and iron districts not less than from 10,000 to 14,000 operatives struck work on Saturday se'nnight, including workmen discharged by blowing out several blast furnaces. There have, however, been no outrages committed in consequence, or any disturbance of the peace. At the Stourbridge iron works, a machine has been invented for squeezing the cinder out of the puddled iron, in consequence of which there will be no further use at those works for the services of the men called shinglers.

Stockport.—The report of the assistant poor-law commissioners appointed to inquire into the nature and causes of the distress prevailing amongst the operatives of this town, and also into the extent to which the distress has been relieved, has recently been published. It commences by giving an account of the working population of the borough previously to the existing depression of trade; and shows that the wages derived from labour by a large portion of those employed in the cotton manufacture were such as to place them and their families above the necessity of resorting to parochial relief. It also acquits them of any charge of improvidence, and adds, that it must be stated, in justice to the manufacturing population of the northern counties, that they exhibit a degree of hardihood in the endurance of distress, and a spirit of pride and independence in regard to the receipt of parochial relief which are not commonly prevalent in other parts of England. With reference to the causes of the prevailing distress, several of the principal mill-owners were examined, all of whom stated that the want of employment, owing to a number of the mills having stopped entirely since 1836, and to most of the others having only worked short time, was the chief cause. Taking all the various circumstances into account, it was estimated that the amount of factory wages paid in this town at present is 5,483*l.* less per week than in 1836. In the conclusion of their report, the commissioners bear testimony to the superior character of the manufacturing population, adding, that they feel assured that the sufferings of such a population will meet with sympathy and consideration from all classes of their fellow-subjects, and that the interests of that branch of trade which has furnished them with employment will be held entitled to peculiar attention from the Legislature.

Railways.—The following are the returns of the principal railways for the last week:—Brighton, 2,895*l.*; Blackwall, 1,050*l.*; Greenwich, 1,018*l.*; Eastern Counties, 1,027*l.*; Northern and Eastern, 1,353*l.*; South-Western, 6,809*l.*; Great Western, 13,918*l.*; London and Birmingham, 17,101*l.*; Grand Junction, 8,530*l.*; Great North of England, 1,284*l.*; Hull and Selby, 848*l.*; Birmingham and Derby, 1,177*l.*; Midland Counties, 2,627*l.*; and Edinburgh and Glasgow, 2,126*l.*—On Thursday the South-Eastern Railway was opened as far as Tunbridge; and the first train, which left that place at a quarter before eight, reached town a few minutes before ten. The down trains were despatched at half-past nine. There are to be four trains each day, except Sunday, and carriages are procured at Tunbridge to convey parties to Hastings, St. Leonard's, Tunbridge Wells, &c. Arrangements have been made with the company, for the transmission of the newspapers, by which the delivery will be accelerated at Tunbridge Wells, and other places, between three and four hours.

IRELAND.

Dublin.—His Excellency the Lord Lieutenant and the Countess de Grey arrived at the Castle from London on Monday. On Tuesday there was a review in Phœnix Park, to celebrate the Queen's birthday, at which his Excellency was present, with a large concourse of spectators. All the regiments in garrison were in attendance, under the command of Lieut.-Gen. Sir E. Blakeney, who has entirely recovered from his recent accident. In the evening a ball, which was numerously attended, was given at the Castle in honour of the same event.—The Repeal Association held their weekly meeeting on Saturday. The Secretary laid before the meeting a communication from the Repealers of Louisiana, United States, enclosing a draft for 200*l.* After some observations from the Lord Mayor, the Secretary read a letter from the National Repeal Convention held in Philadelphia, and one from the Albany Repeal Association. They were ordered to be inserted on the minutes. The Secretary then read an address from the ladies of Dundalk to Mr. O'Connell, forwarding the sum of 10*l.*, the amount of repeal rent subscribed by the ladies of Dundalk within the last fortnight. Mr. O'Connell having moved that the thanks of the Association be given to the ladies of Dundalk, said it was his duty to bring forward the important topics of the day. He meant to propose that the Association pledge itself to a renewed and continuous exertion in favour of repeal. After a long detail of the evils of the Union, his Lordship said, there never was a Ministry since the days of Cromwell more decidedly hostile to Ireland than that at present in office. They had no prospect of relief—they were at the mercy of the British Minister and the British Parliament; and if there was any cessation from attacking them, it was because they thought it more prudent not to trample further on the people of Ireland. There was no man who could deny that there was anything else for Ireland at present except the Repeal of the Union. If Ireland would give him three millions of repealers, he would pledge himself to succeed. His Lordship concluded by moving that the Association, now renewed, pledge itself to the most unremitting exertions in the cause of repeal until the Parliament should be replaced in College-green. He then announced that the amount of repeal rent received since the last day of meeting was 266*l.* 2s. 2½d. Another meeting of the Association was held on Monday, but the proceedings present nothing of particular interest.—The family of the Chief Justice of the Queen's Bench has just suffered a melancholy bereavement by the sudden death of Master John Pennefather. It seems that the Chief Justice had proceeded to the Royal Hotel, Bray, for a few days' relaxation previous to the commencement of Trinity Term, with two of his sons and son-in-law; and while there, his two sons went to Bray Head for exercise. Having arrived at the top of one of the cliffs, the young gentleman's hat was blown off; and either in endeavouring to regain it, or from his foot having slipped, he fell down the face of the cliff, and was killed on the spot. He was 16 years of age, and is said to have been a youth of great promise.

Tipperary.—The disturbances in this county still continue; and the local papers, among numerous other outrages, contain a long account of a murder committed on a man named Michael Laffan, who was shot a few days since at Annaghmeadle, in the barony of Upper Ormond. Government has offered 100*l.* for the apprehension of the murderers, but they have not yet been traced. The alleged offence on the part of deceased is said to have been that of summoning trespassers, in his capacity of under care-taker on the lands of Kilgurtin, a portion of the Bowen estate. With respect to the disturbed state of this county, to which we have referred in several previous Numbers, Lord Eliot, Secretary for Ireland, stated in the House of Commons a few evenings since, that it was unhappily true that very serious outrages had been recently committed in the north of the county, which was in a state which unquestionably required the prompt attention of Government. That attention had been paid to the subject. The police force hitherto stationed in the county amounted to no fewer than 800 men; and to that number 100 more had been lately added by way of reinforcement. There were seven stipendiary magistrates, and four more were now stationed in the vicinity of the disturbed districts. The commander of the garrison at Limerick had also been ordered to hold himself in readiness to assist at a moment's notice. He trusted that those measures would be sufficient to restore tranquillity to the district in question, without its being necessary for Government to apply to the House for any new powers. There was only one other point to which he would allude. He believed the atrocious crimes now committed in Ireland might be traced to the facility of procuring firearms; and it had been represented to him that the law in that respect was inefficient, and that some amendment in it might be necessary. He should not then pronounce any opinion upon that point; he should merely say that it was the only subject on which he thought it probable that the House would be called upon to legislate.

SCOTLAND.

Edinburgh.—The Marquess of Bute, the Lord High Commissioner, held his first levee, which was numerously attended, in the throne-room of the Palace on the 19th inst. About noon his Lordship went to the High Church in procession: and the usual discourse having been delivered by the Rev. Dr. Gordon, Moderator of the last General Assembly, the commission of his Lordship was read, and ordered to be recorded. The Queen's letter was also read, expressing her Majesty's continued interest in the welfare of the Church of Scotland, and her Majesty's deep regret that distress should prevail so extensively, and her desire that means should be taken to mitigate its pressure. The Lord High Commissioner then addressed the Assembly. He said that, having laid before them the Queen's commission and her Majesty's letter it was his duty in the first place to assure them of Her Majesty's resolution to maintain the Presbyterian Government of their church; and this being the first occasion on which he had had the honour to represent the Crown in that Assembly, he hoped he might be permitted to say that he gave them this assurance with the greatest satisfaction to himself. He had further the command of her Majesty to announce to them that she had directed her annual grant of 2,000*l.* to be placed in their hands, for the propagation of the gospel in the Highlands and Islands of Scotland. After some remarks on the distress existing throughout the country, his Lordship concluded by expressing a hope that the deliberations of the Assembly might, under the divine blessing, be conducted to those happy ends which her Majesty so anxiously desired. The Moderator then addressed the Commissioner, congratulating his Lordship on the interest he had always taken in the Church of Scotland; assuring him of the earnest desire of the Assembly to conduct their deliberations in the spirit recommended by her Majesty; and assuring him that the recommendations of her Majesty in behalf of the poor working classes would have a prominent place in their deliberations. A committee was named to answer her Majesty's letter; and the Assembly then proceeded to business, when the Strathbogie case gave rise to a warm debate. Two commissions were presented, the one from the majority, and the other from the minority of the Strathbogie ministers; but as there can only be one presbytery of Strathbogie, the question was which was that one; and a discussion ensued on the subject of the general controversy, viz., the supremacy of the civil or ecclesiastical jurisdiction. After several speeches had been made, Mr. Dunlop moved, That the commission of the Rev. James Dewar, the Rev. Harry Leigh, and Major Stewart, be sustained, and their names added to the roll; and that the commission purporting to be in favour of Messrs. Walker, Thomson, and Edmond, be rejected. Dr. Cook objected to this hasty consideration of so important a question, and moved as an amendment, That the General Assembly do not entertain the commissions of either of the parties. After a long and warm debate, the vote was taken, when there appeared—for Mr. Dunlop's motion, 215; for Dr. Cook's motion, 85. At a subsequent meeting of the Assembly, the Strathbogie case again gave rise to a long and warm discussion. Two commissioners from the presbytery of Strathbogie were admitted and heard on the subject. They stated at length their reasons for not obeying the interdict from the Court of Session, prohibiting them from taking their seats in that Assembly as representatives of the presbytery of Strathbogie; and expressed their resolution not to obey the decision of a civil court in opposition to the duty which they considered they owed to the church. Dr. Candlish then addressed the meeting at great length, and said he supposed the present case was one unexampled in the history of the Church of Scotland. There were two duties which he should be ashamed if the Assembly would shrink from discharging in the circumstances in which it is placed. He held it a duty, on the one hand, that the Assembly should express their approbation that the commissioners from the presbytery of Strathbogie had, in obedience to the word of God, taken their places as members of that Assembly; and on the other, to express the sentiments with which the Assembly regarded such interference with its constitution. Having spoken at length on these points, he concluded by moving a resolution embodying them. He was followed by Dr. Cook, who took a different view of the case: he thought that one great point had been overlooked—that the very establishment of a church was its establishment by law. From that law it derived its ecclesiastical jurisdiction: it must recognise the law of the land. The whole question simply amounted to this: the Assembly was a court constituted by the law of the land, and it was obliged to obey that law as laid down by the expounders of that law. After a long and warm debate, Dr. Candlish's resolution was at last put to the vote, when there appeared—for it, 173; against it, 76. An animated debate afterwards took place, which did not terminate until two o'clock, on a motion by Mr. Cunningham for the abolition of patronage, which was finally carried by a majority of 68; the numbers being—for the motion, 215; against it, 147.

Law.

Vice-Chancellor's Court.—*Garrett* v. *Cockerill.*—His Honour, in giving judgment, said that the question in this case, which rose under the will of the testator in the cause, Mr. Burgess, contained a valid limitation in favour of one of the plaintiffs. By his will, dated Sept. 1809, the testator gave his property in four equal shares—one share to his wife for her natural life, then to devolve to his children, and to the longest liver in equal shares; the remaining three shares to be divided equally between his three children, and the longest liver of their heirs; and the will contained the following words: "Should all my children die without heirs, my property in that case to be divided equally between the children of my brothers and sisters alive at the death of my last surviving child." Upon these last words the dispute in the cause turned. It was admitted that the children of the testator were all dead, and that neither of them had left issue. At the death of the survivor of the testator's children, there were children living of some of the testator's brothers and sisters, and it was in right of Mrs. Garrett, as one of those children, that the present suit was instituted. It was contended for her that the word "heirs," as used in the will, meant either children or issue; that the limitation in favour of the children of the testator's brothers and sisters was intended to take effect only in the event of the testator's children respectively either never having a child, or not leaving a child living at their respective deaths; that the limitation was therefore valid, and that if valid, it had, upon the admitted facts, taken effect. His Honour said he should hold that the word "heirs" meant either children or issue. With respect to the question, whether the testator meant the limitation in favour of the children of his brothers and sisters to take effect only in the event of the issue not being born to either of his children, his impression was, that the language did not authorise such an interpretation. He could not hold that by dying without heirs the testator meant dying without leaving a child. Then came the question, what would be the effect upon the construction of the words "My last surviving child"—whether they would support a restrictive construction of the words "die without heirs?" His Honour then cited several cases bearing upon the construction of the words, and after stating that the will had already been before the Master of the Rolls in 1837, said he should defer to the authority of the learned Judge by dismissing the Bill. He had collected from the bar, however, that the case would in any Court be carried before the Lord Chancellor, and he thought such a course would have been very reasonable, in whichever way he had decided.

Court of Exchequer.—*Stephens* v. *Hill.*—This was a rule obtained by calling upon the defendant's attorney to "show cause why he should not be struck off the roll," or prohibited from practising in this Court, for persuading a witness who had been subpœnaed to give evidence in a horse cause at the Gloucester assizes, to absent himself from the trial. According to the statement contained in the affidavits on which the rule was obtained, the witness, who resided in Yorkshire, and whose name was Jackson, was brought to Gloucester to prove the defendant's handwriting to a warranty. Jackson was known to the defendant's attorney, and he not only persuaded the witness to leave the town, and not remain to give evidence, but upon Jackson's expressing reluctance on the ground that by absenting himself he would be subjected to some pecuniary liability, the defendant's attorney offered to indemnify him against the consequences, and actually gave him a written indemnity to that effect. After this he (witness) left Gloucester, and proceeded to Birmingham, where he remained until he was rejoined by the other witnesses on their return to Yorkshire. Cause was now shown against the rule. It appeared, from the affidavits in reply, that the document which the witness Jackson was subpœnaed to prove was not the actual handwriting of the defendant, but had been written at his request, and that the attorney suggested this to the witness, and observed to him that he could not prove a signature to be in the defendant's handwriting which was not so. It was also stated that the witness had himself expressed a desire not to give his evidence against the defendant, but to return home; and the affidavit stated that the deponent had no recollection of having given the witness any written indemnity; and, if he had done so, it must have been under the influence of intoxication. Under those circumstances, it was submitted that the Court ought to discharge the rule, and not try upon contradictory affidavits a question which might be the subject of a criminal indictment. The Court said, that where an attorney was charged with an offence which subjected him to an indictment, it was a rule not to call upon him to answer the matters of an affidavit, as that would be to oblige him to give evidence against himself. In this case, however, the attorney was not called upon to answer the facts, but to show cause why he should not be prevented from practising until he could explain the facts alleged against him. The Court was of opinion that the facts stated in the affidavits on which the rule was moved had not been satisfactorily answered, and the rule must therefore be made absolute.

SPORTING.

Epsom Races.—These popular races commenced on Tuesday. The programme for the first day was unusually inviting, and the sport equal to expectation. The weather, however, was unfavourable; the rain, which fell heavily, having continued without ceasing until near 2 o'clock, in consequence of which the attendance was less numerous than might have been expected, The racing commenced half an hour after the time appointed with

The Craven Stakes of 10 sovs. each, Craven Course. 14 *subs.*—Mr. Forth's ch. f. Lucy Banks (Bell), 1; Lord Westminster's Satirist, 2; Sir G. Heathcote's Pannakeen, 3. The following also started, but were not placed:—Col. G. Wyndham's Nora Creina; Mr. Price's Marshal Biron; Mr. Thornhill's Equation; Mr. Rush's br. c. by Plenipotentiary, out of Maresfield's dam; Mr. Balchin's Epaulette, Mr. Osbaldeston's f. by The Saddler, out of Ebberston's dam, Mr. Goodman's Music; and Lord G. Bentinck's b. f. by Camel or Rockingham, out of Enterprize. Betting, 5 to 4 and 11 to 8 on Satirist, and 4 to 1 agst Lucy Banks. After one false start Epaulette took the lead at a moderate pace, followed by Satirist, Snowdrop, and Equation, Lucy Banks lying in the rear. There was little change in the position or pace till near the distance, when Lucy Banks went in front, and the lot closing ran well together three parts up it; Satirist and Lucy Banks then singled themselves out, and made a severe race home, the mare winning on the post by a neck. Pannakeen was a respectable third, and Nora Creina was fourth.

The Shirley Stakes of 25 sovs. each, one mile. 3 *subs.*—Mr. Herbert's Nessus by Sir Hercules (Rogers), 1; Mr. Shelley's Iole, 2; Sir G. Heathcote's Arkansas, 3. Betting, 5 to 4 agst Nessus, and 11 to 8 agst Iole. The filly made all the running, Nessus waiting on her to the end of the rails in front of the Grand Stand, where he challenged, and, after a pretty race, won by half a length.

The Woodcote Stakes of 15 *sovs. each.* 5 *subs.*—Mr. G. Ongley's b. f. by Camel, dam by Octavius (Sly), 1; Mr. Forth's Venus by Sir Hercules, 2; Sir G. Heathcote's bl. c. by Velocipede (Dryad), 3; Gen. Wyndham's Handmaiden, 4; The Camel filly made all the running, was challenged at the distance, and won, after a good race, by half a length without having been caught. The third and fourth were beaten off.

The Manor Plate of 50 *sovs. The winner to be sold for* 300 *sovs. Two-mile heats.*—Mr. Nightingale's Ajax (late Nick), (Sly), 1 1; Mr. Kingsley's Jessica, 4 2; Mr. S. Lucas's The Traitor, 2 dr.; Mr. Bradford's Sister to Confusionee, 3 dr.; Mr. King's Exton, bolted. Ajax was the favourite, and won both heats in a canter.

WEDNESDAY.—This being the Derby, or great day of the races, the course, as usual, was crowded from an early hour with a large concourse of visitors. The meeting was expected to have been one of the gayest and most brilliant that had ever assembled on the Downs, but the absence of her Majesty, and the uncertain character of the weather at an early part of the day, served to deprive the course of some of its attraction. The weather, however, cleared up about eleven, and continued fine the remainder of the day; adding greatly to the interest of the sport. It is stated that there were nearly 100,000 persons on the Downs, and the attendance of fashionable and distinguished visitors was as numerous as ever known. About two, Count Mensdorf, uncle to her Majesty, and his four sons, accompanied by Col. Arbuthnot, one of the Queen's Equerries, arrived from Claremont. About three the races of the day commenced with,

The Derby Stakes of 50 *sovs. each, the second to receive* 100*l.* *out of the stakes, and the winner to pay* 100*l.* *towards the police and regulations of the course. Last mile and a half.* 182 *subs.*

Mr. P. Pryse's ch. c. Cheops	(Wakefield)	0
Mr. G. Clark's ro. or gr. c. The Baronet	(Templeman)	0
Lord Westminster's br. c. Auckland	(T. Lye)	0
Col. Wyndham's Singleton, by Ernest	(G. Francis)	0
Lord Wesminster's ch. c. Wm. de Fortibus	(Cartwright)	0
Mr. Copeland's b. c. Combermere, by Bran	(Marlow)	0
Mr. Trelawney's ch. c. Coldrenich	(J. Day)	0
Mr. Gregory's ch. c. Defier, by Defence	(Robinson)	0
Gen. Yates's br. c. Seahorse, by Camel	(Nat)	0

Betting at Starting.—11 to 8 agst. Coldrenich, 5 to 1 agst Attila (6 to 1 laid two or three times), 12 to 1 agst Jack, 12 to 1 agst Forth's lot, 14 to 1 agst Seahorse, 20 to 1 agst Agreeable colt, 30 to 1 agst Chathan, 40 to 1 agst Combermere, 40 to 1 agst William de Fortibus, 40 to 1 agst Lesso, 50 to 1 agst Auckland, and 1,000 to 10 agst any other.

Some time elapsed before the horses made the final start; which being accomplished, and the horses having fairly settled into their places, Combermere took the lead, followed by Attila, Lasso, and Belcœur, the second lot being headed by Auckland, Chatham, Seahorse, Policy, and Coldrenich; to these succeeded a body of horses in racing phraseology "the ruck",, and then the tail, viz.:—Defier, Robert de Gorham, Palladium, Hydaspes, and Jack—the latter having lost a start of nearly 100 yards. For the first quarter of a mile the pace was moderate; it then quickened, and Lasso immediately vacated the third place, but in other respects the race proceeded as described above, till near the turn, when Belcœur headed Attila and Combermere, and with the two at his shoulders carried the running into the straight course, the lot behind them consisting of Chatham, Auckland, Seahorse, Policy, and the Agreeable colt; Robert de Gorham, who had gradually improved his position, lying next. The front rank continued intact to the road, but it was otherwise with that behind it:—Coldrenich had already shown that the distance was too great for him; Chatham fell lame; Seahorse, Policy, and the Agreeable colt, had shot their bolts, and Robert de Gorham, passing them in succession, took his ground next to Auckland; a few yards of the distance Combermere gave up entirely, and fell into the ruck; and immediately after, Attila shot past Belcœur, took a decisive lead, kept it to the end, and won with perfect ease by two lengths. Robert de Gorham ran by Auckland half way up the distance, collared Belcœur at the stand, and beat him for the second money cleverly by a length, Auckland being well up with Belcœur at the finish. The Agreeable colt and Policy were fifth and sixth, Seahorse dividing them from the crowd behind. Jack and Palladium were about the last two. The pace was good, but not first-rate. Value of the stakes, 4,900*l.*

The Epsom Stakes of 5 *sovs. each, with* 35 *added. The winner to be sold for* 120*l.* 1 *mile.* 12 *subs.*—Mr. Forth's Camelino (Bell), 1; Mr. Forth's f. Trident, 2; Mr. J. Day's br. m. by Nimrod, out of Busk, 3. The following also started, but were not placed:—Count Bathyany's Gammon-Box; Mr. Bushell's Jenny Jones; Mr. Smith's Astronomer; Mr. Balchin's Gog (h. b.); Mr. Treen's Haitoe; Mr. Goodman's Miss Fidget; and Mr. Pryse Pryse's Australia. The race was entirely between Mr. Forth's two, and was won cleverly.

The Walton Stakes of 5 *sovs. each, with* 35 *added. The winner to be sold for* 100*l.* 1 *mile.* 7 *subs.*—Mr. Forth's Knightsbridge (Butler), 1; Mr. Jobson's Frank, 2; Mr. Savage's John o'Gaunt, 3. The following also started, but were not placed:—Marquis of Exeter's Patchwork; Mr. Garrard's The Dandy; Captain Cunningham's Mungo Park. Won cleverly by a length; a good race for second.

The Burgh Stakes of 5 *sovs. each, with* 35 *added. Winner to be sold for* 80*l.* *One mile.* 12 *subs.*—Capt. Daintree's b. c. by Mulatto, dam by Middleton (Marson), 1; Capt. Rous's Nicholas, 2. The following also started: Lord G. Bentinck's Balcony, Lord Exeter's Patchwork, Hon. S. Herbert's Teetotaller, Mr. Litchwald's b. m. Distance, Mr. Price's Marshal Biron, Mr. Greville's Palæmon, Mr. Lawrence's Lampedo, Mr. Williamson's Wiltona, Mr. S. Scott's f. by Bay Middleton, Mr. F. Walter's Miss Whinney. A short quick-run race, and won cleverly by half a length.

THURSDAY.—The showery state of the morning occasioned a thin attendance of visitors this day, and deprived the sport of much of its interest. The running commenced at half-past two, and from the number of heats into which the plates were spun, did not terminate until six. The following is a report of the results:

Sweepstakes of 10 *sovs. each, h. ft., with* 50 *added. Mile and a quarter.* (14 *subs.*)—Mr. Herbert's Teetotaller (Evans), 1; Mr. Goodman's Miss Fidget, 2.

The following also started, but were not placed: Lord Exeter's Revision, Mr. May's Master Aaron, Mr. Nightingale's Ajax, Mr. Treen's Haitoe, Captain Ives's Folly, Mr. King's Tommy, Mr. Forth's Vibration, Mr. Phillimore's Rochester, and Mr. Kling's Dahlia. No betting. Rochester took the lead at a good pace, and with Folly at his heels, made the running to the turn, where both gave way; Miss Fidget and Teetotaller took their places and made a capital race home, the colt winning by a head; Revision and Vibration were up at the finish.

Fifty pounds, free for any horse entered for any of the races on Tuesday and Wednesday, others to pay 3 *sovs. each. The winner to be sold for* 200 *sovs. &c. Mile heats.*

Fulwer Craven's That's-the-Time-of-Day (Bartholomew)	3	3	1	1
Mr. Balchin's Dromedary	6	1	2	2
Mr. Phillimore's Finchley	1	4	3	3
Mr. Sherrard's Lady Mary	5	2 dr.		
Mr. Lucas's Traitor	2 dr.			
Mr. King's Exton	4 dr.			

The first heat was closely contested by Finchley, The Traitor, and That's-the-Time-of-Day, and was won by about a neck. Second heat—Lady Mary made all the play, but ran out near the cords and was beaten by a length; Finchley did not go for the heat. Third heat—Finchley cut out the work to the distance, where he was passed by the other two; an indifferent run in, ended in favour of That's-the-Time-of-Day by a length.

Fifty Pounds, free for any horse which has been entered for any of the preceding races, others to pay 3 *sovs. each. Winner to be sold for* 150*l.* *Mile and quarter heats.*

Mr Shelley's b. c. by Glaucus, out of Malibran (Esling)	0	1	1
Mr. King's Exton	1	2	2
Mr. Falconer's Miss Emily	3	5	3
Mr. S. Lucas's The Traitor	2	3 dr.	
Mr. Balchin's Affection	0	4 dr.	
Mr. Dockerary's Dispatch	0	6 dr.	

First heat, won by a neck, after a good race between the three; second heat, won by a length; third heat, won easy.

FRIDAY.—The great race of the day was for *The Oaks Stakes, of* 50 *sov. each, h. ft.* Value of the stakes 3,150*l.* Four failures took place before a fair start was effected. 16 started; several were beaten early, and Mr. F. Marshall's ch. f. by Bran out of Fury (Lye) went to the front, and won cleverly by a length. Mr. Shackell's ch. f. Meal was second.

The 50*l.* *for* 3-*years olds* was won by Mr. Shelley's Iole (Butler); *The Members' Plate* of 50*l.* by Capt. Cunningham's Mungo Park; and *The Derby and Oaks Plate* by Mr. Shelley's b. c. by Glaucus out of Malibran.

MARK LANE, FRIDAY, MAY 27.—We have had but little English Wheat fresh up since Monday, and the supply has been cleared off at that day's currency. Free Foreign is offered generally on the same terms, without much progress having been made in sales: there is still inquiry for Bonded at improving prices.—Barley, Peas, and Beans are unaltered in value.—Fine English Oats are 1s. dearer; the trade for Irish is firm, having a short supply.—During this week there has been a general rain, which is very beneficial to the growing crops.

GAZETTE OF THE WEEK.

INSOLVENTS.—T. Quaife, T. J. Tyrrell, and J. Quaife, North-end, Fulham, brewers—H. Stevens, Willian, Hertfordshire, and J Stevens, Clophill, Bedfordshire, builders—H. F. Delamain, St. Mary-at-Hill, London, wine-merchant—M. and W. Johnson, Cheadle, Staffordshire, grocers.

BANKRUPTCIES SUPERSEDED.—W. Hooper, Reading, tobacco manufacturer—W. M. Brown, jun., Skinner's-place, Sise-lane, City, merchant—J. Thomas, Ramsgate, butcher—J. Owen, Woolwich, cow-keeper.

BANKRUPTS.—A. Telfer, Praed-street, Paddington, smith—W. and E F. Finden, Southampton-place, New-road, Pancras, engravers—J. Smith, Hertford, wine-merchant—J. and J. Simmons and J. Pine, Battersea, Surrey, manufacturers of prussiate of potash—M. Quick, Compton-street, Burton-crescent, baker—J. Fuller, Maidenhead, Berkshire, cord merchant—J. Radford, Tiverton, Devonshire, upholsterer—J. Tattersall, Heath Charnock, Lancashire, coal-merchant—W. G. Gray, Bath, dentist—J. Jones, Carnarvon, woollen-draper—R. Attree, Brighton, Sussex, hosier—R. Biass, Liverpool, wine-merchant—J. Cottereil, Darlaston, Staffordshire, hinge maker—J. Berry, Rugby, Warwickshire, grocer—W. Donald, Brighton, furrier—E. Bowra, late of Gracechurch-street, umbrella-warehouseman—C. Helmer, senior, West Bromwich, Staffordshire, wine and spirit merchant—F. Davis, Weymouth, wine and spirit merchant—T. Evans, Welshpool, Montgomeryshire, draper—C. Pendlebury, Bury, Lancashire, bleacher—Wm. Heywood, Manchester, merchant—Wm. Gooding, Chatham, boot and shoemaker—G. Hutton, Liverpool, ship chandler—E. Style, Windsor, bookseller—W. Hill and W. K. Wackerbarth, Leadenhall-street, ship and insurance agents—T. Dykes, Broad-street, St. Giles's, stationer—J. Dawson, Huddersfield, Yorkshire, draper.

SCOTCH SEQUESTRATIONS.—E. Johnstone, Stirling, bookseller and printer—D. Leighton, Dundee, baker—A. Corti, Glasgow, carver and gilder—A. Lothian, Edinburgh, publisher—W. Boyd, Saltcoats, merchant—Thomson and Spiers, Greenock, ship-builders.

BIRTHS.—On the 24th inst., at Little Stanmore, Middlesex, the lady of J. Sladen, Esq., jun., of a son—On the 20th instant, at Weymouth, the lady of Lieut.-Col. Jasper Hall, of a son.

MARRIED.—On the 19th inst., at Dawlish, Devonshire, G. Wilson, M.B. Trinity College, Cambridge, to Mellene, daughter of the late J. Lowder, Esq., of Chapel-house, Bath—On the 26th inst., at Hornsey, Mr. R. Barnett, of the Minories, to Jane Frances, only daughter of the late Joseph Maddox, Esq., of Stoke Newington.

DIED.—A most severe affliction has befallen the family of Mr. Linton, nurseryman, of Haverstock-hill, Hampstead; in the space of three days no fewer than four of his children have died of a malignant fever. One of them, who had been employed in nursing the rest, was apparently quite well on Friday morning, and before Saturday night she was dead. The father and one of his sons have been removed to the hospital, where they continue in a precarious state—On the 4th inst., at St. Petersburgh, Sir Robt. Ker Porter, K.C.H., late Consul-Gen. at Venezuela—On the 23d inst., at Chelsea, aged 43, Mr. W. Goodhugh, a writer of considerable repute on biblical literature—On the 23d, in Great Russell-street, aged 59, W. M. Thiselton Dyer, Esq., coroner and steward for the Tower, and one of the magistrates of Middlesex—On the 24th inst., in St. James's-street, aged 79, C. Wilson, Esq., of Oxton Hall, generally known as the Father of the Turf—On the 22d inst., at Richmond, aged 44, J. H. Tredgold, Esq., late secretary of the British and Foreign Anti-slavery Society—On the 20th, in his 54th year, Mr. A. W. Webster, aurist and oculist, formerly of New Bond-street—On the 18th, at Soho, Staffordshire, M. Boulton, Esq., of the firm of Boulton and Watt, engineers, aged 72—On the 26th, at Brighton, the Earl of Coventry, in his 59th year.

Price 1*s.* 9*d.*

London: W. S. Orr and Co.; and W. and R. Chambers, Edinburgh.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates. Price 2*s.* 6*d.*

PAXTON'S MAGAZINE OF BOTANY. The Number for May, 1842, contains highly-finished drawings of *Franciscea latifolia*, *Calceolaria Standishii*, *Zieria lævigata*, and *Rhododendron Smithii aureum*; likewise Papers on Gardening as a science, with illustrative woodcuts; on Improving Indigenous Plants; Baskets for Orchidaceæ, copiously illustrated with engravings; Floricultural Notices of new and beautiful Plants figured in the chief Botanical Periodicals for March and April, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

BRIGHT'S NUTRITIOUS FARINA, FOR Invalids and Children, the Consumptive, Asthmatic, and Dyspeptic. Highly patronised and strongly recommended by the Medical Profession as containing a larger proportion of Nutriment, being more economical, and easier prepared than any other article of its kind ever yet offered to the Public. The Proprietor of this Farina begs to state, that its properties have been for some time known in extensive private use, and it is at the suggestion of many of his medical friends that he is induced to offer the public the benefit of its more general introduction. Its excellence is supported by numerous testimonials from medical gentlemen, and public institutions, requiring only to be tried for its advantages over all other beverages, for invalids and children, to be immediately discovered; and is also particularly adapted for *hospitals*, *infirmaries*, and large *institutions*, for its economy, and the simplicity of its preparation for use.

Sold in Canisters at 1*s.* 6*d.*, 3*s.* and 6*s.* each, with directions for use, Testimonials, &c., at the Manufactory, No. 5, Holland-street, North Brixton, and by Agents in Town and Country.

Just published, No. VIII., price 2*s.* 6*d.*

FOR THE FACE AND SKIN

ROWLAND'S KALYDOR, a Preparation from Oriental Exotics, is now universally known as the only safe and efficient protector and beautifier of the Skin and Complexion. Its virtues are commonly displayed in thoroughly eradicating all Pimples, Spots, Redness, Tan, Freckles, and other unsightly cutaneous defects, and in rendering the most rough and uneven Skin pleasantly soft and smooth. To the Complexion it imparts the juvenile roseate hue, and to the Neck, Hand, and Arm a delicacy and fairness unrivalled.

It is invaluable as a renovating and refreshing Wash, during travelling or exposure to the sun, dust, or harsh winds, and the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving.

Price 4s. 6d. and 8s. 6d. per bottle, duty included

CAUTION.—Ask for "ROWLAND'S KALYDOR," and see that these words are on the envelope, with their signature and address in *red*—"A. ROWLAND AND SON, 20, Hatton Garden, London;" the same are engraved on the Government stamp affixed over the cork.—Sold by them, and by respectable Perfumers and Medicine Venders.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, May 28, 1842.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MEMBERS of the ROYAL AGRICULTURAL SOCIETY of ENGLAND who expect to be able to attend the Meeting of the Society at Bristol in July next, are requested by the Local Committee of that place to transmit their names to Mr. JAMES MARMONT, 15, Corn-street, Bristol, in order to aid the arrangements which the Local Committee are making for the commodious reception and comfort of the Members at the ensuing Meeting.

JAMES HUDSON, Secretary.
London, May 27, 1842.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT BRISTOL.

THE SOCIETY'S SHOW of CATTLE, IMPLEMENTS, &c., will take place on Thursday, the 14th of July next, and all persons intending to exhibit Stock, Implements, or other articles, are requested to observe that all CERTIFICATES or ENTRIES must be sent to or lodged with the Secretary, at the Society's house, No. 12, Hanover-square, London, on or before Tuesday, the 14th of June, and that no entries will be admitted after that day. A bill of the Prizes offered, and the printed Forms of Certificate, &c., can also be obtained by applying to the Secretary, at the above address—it being particularly requested that all parties making such application will specify the kind of Stock, &c., which he intends to enter, in order that the proper Certificate Forms may be sent accordingly.

By order of the Council, JAMES HUDSON,
London, May 11, 1842. Secretary.

WEST LONDON GRAND FLORICULTURAL EXHIBITION, for Prizes of Two Silver Cups and Twenty-three Medals, under the superintendence of Mr. J. T. Neville, will be held in the Grounds of the Almshouses of the Butchers' Charitable Institution, at Walham Green, Fulham, on Wednesday, the 22d, and Thursday, the 23d June.

Also a LADIES' BAZAAR and FANCY FAIR, under the patronage of Her Most Gracious Majesty Queen Adelaide, in aid of he Building Fund.

Military and Quadrille Bands will attend. The Gates will be opened at 12 o'clock each day. Admission 1*s.*

Dyer's Buildings, Holborn. JAMES NESS, Sec.

NOTICE TO EXHIBITORS.

A SELECT FLOWER SHOW will take place on Tuesday, the 21st of June, in the Gardens of the Royal Beulah Spa, Norwood. The following is the description of a portion of the prizes to be awarded on the occasion, viz.—

	1st.	2d.	3d.
For the 3 best collections of 24 Greenhouse Plants in flower	6*l.*	3*l.*	1*l.*
For the 3 best collections of 12 Geraniums . .	3*l.*	1*l.*	15*s.*

Prizes will be also given for Cut Flowers and Specimen Plants. Further Particulars will be advertised in next week's Number of this Journal.

WARWICK and WARWICKSHIRE HORTICULTURAL SOCIETY.—At the Second Exhibition, to be held at the County Hall, Warwick, June 23d, 1842, Sweepstakes, open to all England, for cut specimens of Geraniums, Pinks, Roses, Heartsease, Fuchsias, &c. The specimens may be consigned, carriage-paid, to Mr. HODGKINSON, Secretary. Particulars may be had on application.

TO HEARTSEASE GROWERS.

J. PEARSON'S SPLENDID PANSY, the "BLACK PRINCE," is ready for delivery at 15*s.* each; on receipt of a Post office order, it will be sent by post, prepaid. It is much larger and better shaped than "Black Diamond," brighter black, and fine golden eye.—Chilwell Nurseries, near Nottingham.

THE NEW GERANIUM—"LYNE'S SUNRISE," which obtained the Gold Medal at the Plymouth Horticultural Show last week, and which created such an extraordinary sensation at the Exeter Horticultural Show last Thursday, can be ordered of Mr. W. E. RENDLE, Union-road Nursery, Plymouth, by whom the stock has been purchased, at Three Guineas each.

LYNE'S SUNRISE.—The colour is of a bright rosy orange, very large flower, and of the most perfect form.

Union-road Nursery, Plymouth, May 26, 1842.

CHEAP SHOWY PLANTS FOR FLOWER-BEDS.

WILLIAM BARRATT begs to offer to Floriculturists, as below, CALCEOLARIAS, GERANIUMS, VERBENAS, FUCHSIAS, PANSIES, DAHLIAS, and other free-blooming Garden Flowers, at 4*s.* to 6*s.* per dozen; strong Plants ready for planting out. A fine collection of the above plants in named sorts, as well as other Greenhouse and Herbaceous plants for Rooms and Greenhouses.

About 10,000 GREENHOUSE HEATHS and EPACRISES, in fine health; worthy the attention of the Amateur and Nurseryman.

⁂ NATURAL GRASSES for permanent pasture, in selected sorts. Persons ordering these should give the quantity of ground, the situation and quality of the soil, and for what purpose wanted; doing this they may rely on having the proper kinds, and at not above one-third more expense than the old mixtures of Hay-seeds, which are very uncertain in producing good Herbage. Also, DWARF LAWN GRASSES; as much seed as will sow 100 square yards for from 3*s.* to 4*s.*

Wakefield Nursery, May 1842.

NEW AND SUPERB FUCHSIAS.—Messrs. W. and F. YOUELL continue sending out their splendid collection of the above, by post, free, to any part of the United Kingdom. For particulars see their Advertisement in the *Gardeners' Chronicle* of the 21st inst.

Great Yarmouth Nursery, May 26, 1842.

LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, Album, and Punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

THURTELL'S SEEDLING GERANIUMS.

J. ADAMS begs to acquaint the admirers of this beautiful Flower, that he has had the honour to place an entire Set of the 24 Seedling varieties raised by Charles Thurtell, Esq., in the Greenhouse of M. P. Guimaraens, Esq., of No. 1, Northwick-terrace, Maida Hill, Edgeware Road, with permission to state that any Amateur, Florist, or Nurseryman, who may wish to see them, will be kindly allowed to do so, on application to Mr. G.'s as above any morning before 9 o'clock, or after 5 in the afternoon.

J. A. begs further to state that with the exception of Britannia, Lady Minto, Eclipse, Elegans, and Reform, he has a considerable quantity of the other varieties, as advertised in the *Gardeners' Chronicle* some three or four weeks back, still on hand, and which he will be happy to supply on moderate terms.

Belmont Gardens, Stoke, near Devonport, May 30, 1842.

CHAPMAN'S NEW SPRING POTATOES.—This excellent new variety, possessing all the qualities of the best Ash-leafed Kidney, but capable of being produced in perfection for table from November till June, is now ready for delivery at One Guinea per bushel, with directions for their culture in the open ground without protection.

"We never yet tasted any forced or retarded Potatoes anything like so good."—Dr. Lindley, in *Gardeners' Chronicle.*

"We can only repeat, that, be they what they may, they are of excellent quality."—Dr. Lindley, in *Gardeners' Chronicle*, Apr. 2.

"They are of excellent quality and appearance, and in my opinion only require to be known to be generally cultivated."—Geo. Mills, Gunnersbury, May 20th, 1842.

⁂ Orders for sample baskets, enclosing 1*s.*, will be attended to; but orders for sets must be prompt—addressed to T. H. Chapman, Brentford-end.

FINE SUCCESSION PINE PLANTS.

TO BE DISPOSED OF, about EIGHTY FINE SUCCESSION PINES, being the property of a Gentleman who is about to discontinue the cultivation of them. The Plants are of fine growth, in three grades of size, and are of that most valuable kind known in Lancashire by the name of Black Jamaica, and about London, &c., as Montserrat. They are warranted clean from any injurious insects that affect the Pine; and the present being the proper season for shifting, the Plants can be carefully packed for removal to any part of the Kingdom.

Any inquiries by letters, prepaid, and addressed to J. and C. WHALLEY, Nurserymen, &c., South George Crescent, Liverpool, will be duly replied to.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to Public Competition, at the Auction Mart, Bartholomew-lane, on Tuesday, June 7th, Thursday 9th, and Friday 10th, 1842, at 12 o'clock, about 500 of the most approved Dahlias, Splendid Geraniums, New Fuchsias, Verbenas, and a great variety of other Plants.

May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

BARNSBURY NURSERY.—Messrs. PROTHEROE and MORRIS are instructed to offer to Public competition, on the Premises, Thornhill Road, Barnsbury Park, Islington, on Monday, June 13, 1842, and following day, at 11 o'clock (if not previously disposed of by private contract), the desirable LEASEHOLD NURSERY; also the whole of the choice GREENHOUSE PLANTS, consisting of the newest varieties of Geraniums, Heaths, Camellias, Calceolarias, Fuchsias, Clematis Seboldii, Daphne, Heliotropes, Verbenas, Salvias, &c. Four newly-erected Greenhouses; several Pits, Frames, Hand-lights, Utensils in Trade, &c.

PRODUCTIVE LIFE ASSURANCE SOCIETY and MARITIME FUND empowered by Acts of Parliament. Offices, 29, Moorgate-street, Bank, London.

Board of Directors.

John Blogg, Esq., Guildford-st., Russell-square.
Donald Grassick, Esq., Bedford-place, Kent-road.
Hyam Hyams, Esq., Cornhill.
George Rose Innes, Esq., Billitor-street, City.
J. Linnit, Esq., Argyll-street, Regent-street.
W. T. Smith, Esq., Public Office, Southampton-buildings.

(With power to add to their number.)

Treasurer.—Hyam Hyams, Esq.

Auditors.

Robert Dover, Esq., Cornhill.
Amos Hodgson, Esq., Ordnance Office, Tower.
James Walton, Esq., Grocers' Hall.

Arbitrators.

Charles Compton, Esq.
Peter Ellis, Esq.
John Tidd Pratt, Esq.

Bankers.—The Bank of England.
Physician.—William Brewer, M.D., F.R.S., &c., 21, George-street, Hanover-square.
Surgeon.—David Lewis, Esq., 28, Artillery-place West, Finsbury.
Solicitors.—Messrs. Chatfield, Wingate and Hart, Cornhill.
Actuary.—Francis G. P. Neison, Esq.
Chief Agent for the Maritime Fund.—Thomas Bull, Esq., 91, Minories, London.

This Society is established on the principles of Mutual Life Assurance, with a division of the whole amount of profits among all the assurers, to whom the books of the Society always lie open for inspection. A General Meeting takes place annually, at which is given a detailed account of the business of the Society. No policy stamp duty charged on assurances above the term of ten years.

The Maritime Fund is a department of the Society which affords to captains and mariners the same facilities and advantages of life assurance which residents in England have hitherto enjoyed. Upon this fund, at a comparatively small cost, a member (should he be lost at sea on a particular voyage) will provide an annuity for his wife as long as she lives, in proportion to what he has paid.

Every particular may be known, and Prospectuses and "Observations upon the Maritime Fund" obtained, by applying to Mr. Bull, any of the country agents, or the Secretary, at the offices, 29, Moorgate-street. GEORGE B. SCOTT, Secretary.

BRITANNIA LIFE ASSURANCE COMPANY,
1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Viet., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l.* for whole term of Life.

PETER MORRISON, Resident Director.
A liberal commission allowed to Solicitors and Agents.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronised their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l.* 5*s.* and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s.* 3*d.*, 3*s.* 3*d.*, and 4*s.* 3*d.* per yard.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name: in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

⁂ NUTT ON BEES (5th edition) now published.

GARDEN SEATS, FLOWER STANDS, WIRE WORK, GREENHOUSES, &c.

J. CRIPPS, No. 11, MARKHAM PLACE, KING'S ROAD, CHELSEA, Wire Worker by special appointment to her Majesty Queen Victoria, the Dowager Queen Adelaide, and her Royal Highness the Duchess of Kent, begs respectfully to inform the Nobility and Gentry that he has at present on hand, the largest stock in London of Rustic and other Garden Seats, Chairs, Stools, Tables, Flower Stands, Mignonette and Plant Boxes, Wire Work of every description, as Arches for walks, Flower Bordering, Trainers for plants, &c. &c. J. C. also constructs Forcing Houses, Conservatories, Greenhouses, Verandahs, Alcoves, and Summer Seats, Invisible and Hare-proof Fences, Gates, &c.; in short, almost every decorative appendage to the Rural Residence.

Plans and Estimates submitted for works in contemplation. Blinds of every description made, repaired, altered, or painted.

FLOWER PROPS, of Wrought Iron, made upon an approved principle, in lengths of 2 ft. to 8 ft. Also, Garden Engines, Greenhouse Syringes, improved Watering Pots, Fumigating Bellows, Grass and Border Shears, Pruning Knives and Shears, and all other Horticultural Implements, upon the most advantageous terms, at Trudell and Edwards's, Wholesale and Retail Ironmongers, 46, Leadenhall-street, London.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists; that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

BOTANY.

With four beautifully-coloured steel-plate figures, and sixteen wood-cut Miniatures of the most interesting plants for Garden culture.

Publishing monthly, large, 1s. 6d.; small, 1s.

THE BOTANIC GARDEN; or Magazine of Hardy Flowering Plants; by B. MAUND, F.L.S. Each Number contains four finely-coloured figures of Ornamental Plants selected for their beauty and utility in the decoration of the open Flower-Garden and the Shrubbery; with a popular Historical Description of them, Account of their Habits, and Instructions for their Culture. Each Number contains also the FLORAL REGISTER, with Sixteen Miniature Cuts of the rarest Plants, and a detailed account of each; and the AUCTARIUM, being a register of interesting information on Gardening, &c.

No. 210 of the BOTANIC GARDEN was published on the 1st of June, and will contain Indices to the first Parts of the Floral Register and Auctarium, which now form a handsome Volume; and a continuation of them is still given in each successive No.

The first eight volumes of the BOTANIC GARDEN may now be had complete in boards, at 37s. per vol. large, and 25s. small, without extra charge for the 9th vol., comprising the Floral Register and Auctarium, and which contains nearly 1200 finely-executed Woodcuts of Plants.

London: Simpkin and Marshall, and Sherwood & Co.

IMPORTANT TO AGRICULTURISTS, &c. &c.

Just published, and sold by Maish and Co., 1, New Bridge-street, Vauxhall, price 1s.,

A WORD OR TWO ON GUANO, and a NEW MANURE—ARTIFICIAL GUANO.

By W. H. POTTER, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15s. per cwt. cash.—Chemical Works, Upper Fore-street, London.

PROPOSALS TO ABOLISH ALL POOR-LAWS, except for the Old and Infirm, and to establish ASYLUM FARMS, on which to locate the Destitute Able-bodied Poor, who might thereon maintain themselves, and benefit the Country 18,000,000*l.* annually.

"Prosperity could never be reached and maintained in this country without some provision for the *regular employment* of the Poor."—*Mr. Beckett's Speech in the House of Commons, Feb.* 3d, 1842.

By R. J. MARRISON, Esq.,

Formerly Agent to the Kent Agricultural College, and Lecturer on Agricultural Education.

London: Published by Sherwood, Gilbert, and Piper, 23, Paternoster-row. Price 6*d.*

On the 1st of June, price 7*s.* cloth, Part I. of

THE PHYTOLOGIST; a Popular Botanical Miscellany. The Contributions are by C. C. Babington, Miss Beever, W. Borrer, Rev. W. T. Bree, Dr. Bromfield, D. Cameron, Miss Carpenter, Rev. F. F. Clark, H. Doubleday, E. Doubleday, T. B. Flower, S. Gibson, Dr. Greville, Mrs. Griffiths, L. H. Grindon, J. W. G. Gutch, Rev. W. S. Hore, Rev. C. A. Johns, Al. Irvine, Edwin Lees, W. A. Leighton, G. Luxford, B. Maund, J. S. Mill, E. Newman, J. Ralfs, T. G. Rylands, Mrs. Riley, J. Riley, J. D. Salmon, S. Simpson, R. Spruce, W. A. Stables, J. Tatham, jun., G. H. K. Thwaites, N. B. Ward, H. C. Watson, F. Westcott, W. Wilson, Dr. Wood, Miss Worsley, and other eminent British Botanists. Many of the papers are illustrated with expensive woodcuts.

☞ The PHYTOLOGIST will in future be published in monthly Numbers, price 1*s.* each.

John Van Voorst, Paternoster-row.

NEW WORK ON BEES.

In a few days, in small 8vo, with numerous Engravings on Wood,

MY BEE-BOOK. By the Rev. W. C. COTTON, M.A., Student of Christ Church, Oxon; and Chaplain to the Lord Bishop of New Zealand.

Rivingtons, St. Paul's Churchyard, and Waterloo-place.

COMPLETION OF JOHNSON'S FARMER.

NOTICE IS HEREBY GIVEN, that Ships will be regularly despatched on the 1st day of every month during the present year, to one or more of the Company's Settlements of Wellington, Nelson, and New Plymouth.

In the Wellington District the Sales take place by Auction, and an allowance of 25 per cent. is made towards the passage-money of purchasers arriving from England.

Lands in the Nelson Settlement are sold in this country at the price of 300*l.* per allotment; comprising 1 town acre, 50 acres of accommodation, and 150 acres of rural land. Purchasers receive passage allowances not exceeding 25 per cent. upon their purchase-moneys.

Lands in New Plymouth are sold in this country to actual colonists at 75*l.* per allotment of 50 acres; and a town lot, with passage allowances not exceeding 25 per cent.

The Company continues to offer a Free Passage to Agricultural Labourers and Mechanics of good character, and eligible according to the regulations.

Maps and Views of the Country may be seen, and all necessary information obtained, by application at this House.

By order of the Court,
JOHN WARD, Secretary.
New Zealand House, Broad-street Buildings,
19th May, 1842.

SHIPS FOR NEW ZEALAND.—NOTICE IS HEREBY GIVEN, that the following Emigrant Ships have been Chartered by the New Zealand Company to sail from the ports and on the days undermentioned, viz.—

FOR NELSON.

OLYMPUS, A 1, 316 Tons, from London, June 15th.
NEW ZEALAND, A 1, 380 Tons, from Greenock, July 1st.

FOR WELLINGTON.

GEORGE FYFE, A 1, 391 Tons, from London, June 15th.

FOR WELLINGTON and NEW PLYMOUTH.

BLENHEIM, A 1, 374 Tons, from Plymouth, July 1st.

Applications for Free Passage by labouring persons duly qualified are received daily at this House.

By order of the Court,
JOHN WARD, Secretary.
New Zealand House, Broad-street Buildings,
19th May, 1842.

THE following communication (translated from the German) was addressed to Messrs. Rowland's Agent at Cologne:—

13, Straitz Euggasse, Cologne,
Mr. Th. S. Ditges, May 23, 1841.

Sir,—I have much pleasure in informing you of the extraordinary effects of "ROWLAND'S MACASSAR OIL." For about nine years I had not a particle of hair on my head, when I was casually recommended to give this celebrated Oil a trial; I accordingly purchased two bottles at your establishment, and strictly followed the printed directions: in the course of two months my head was covered with fine short hair, which I had cut off, and continued to persevere in the use of the Oil. The result is, that after five months' perseverance, I can now boast of as good a head of hair as any man in this city. In justice to the inventors I make this acknowledgment, and shall feel great pleasure in satisfying any inquiry.—I salute you with respect.

ADAM BAUER, 8th Artillery Brigade.

ROWLAND'S MACASSAR OIL prevents hair from falling off, or turning Grey; changes Grey Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

⁂ Ask for "ROWLAND's MACASSAR OIL."

The LOWEST PRICE is 3*s.* 6*d.*; the next price is 7*s.*—10*s.* 6*d.*, and 21*s.* per bottle.

ISLE OF WIGHT.

TWO or THREE YOUNG LADIES, of good Family, in delicate health, are received into the Family of a Physician, whose residence is beautifully situated in the most picturesque part of the Island, between Ryde and Brading, surrounded by extensive Gardens and Pleasure-grounds, commanding a fine View of the Sea, and within a few minutes' walk of a firm sandy beach. They have constant Medical Care, Salt-water Baths, frequent Excursions on the Water, &c., the use of a Carriage, together with all the Comforts of Home, and everything requisite to promote their health. The Climate is well suited to such as have a tendency to Consumption.—Apply to M. D., care of Miss Wallis, House Agent, Ryde.

THE DOUGLAS MONUMENT.

THE Committee appointed to carry into effect the Erection of a Monument to the memory of that eminent Botanist, the late David Douglas (to an engraving of which each Subscriber is entitled), beg to inform the Subscribers that the Monument was finished last year, and that the Engravings are now ready for distribution, and to be had on application to Messrs. DICKSON and TURNBULL, Seedsmen, Perth, and the other gentlemen in Scotland who furnished Subscription Lists; and to J. C. LOUDON, Esq., Bayswater, London.

[As Mr. Loudon lives a mile from town, and it might be inconvenient to many persons to send to him for their copies, he has deposited the 500 sent to him at the office of the "Gardener's Gazette," 320, Strand; the Proprietors of that Paper having kindly undertaken to deliver them to any persons sending or calling whose names shall be found in a list left at the office. The Lithograph would be injured if sent by post; therefore it is hoped that all who claim copies will send for them or call, and not trouble either Mr. Loudon or the Proprietors of the "Gardener's Gazette" with letters on the subject.]

⁂ A list of the subscribers to Douglas's Monument, together with the Report of the Committee, an Engraving on Wood of the Monument, and a Portrait of Douglas, will be found in the "Gardener's Magazine" for June.

WANTS a SITUATION as GARDENER, a Married Man, 32 years of age, without any incumbrance, who well understands his profession in all departments; would not object to live in a lodge if required. Direct M. N., Mr. Davies's Coffeehouse, Queen-street, Seymour-place, London.

WANTS a SITUATION as GARDENER, a Married Man, who has a thorough knowledge of his business in all its branches, and can have an undeniable character from his last situation. His Wife can assist in the Laundry, or take care of the Dairy, if required.—Address to M. H., Mountjoy and Son's, Nurserymen, Ealing, Middlesex.

WANTS EMPLOYMENT, a Steady Man, about 45 years of age, who has spent nearly 15 years in the Nursery line and about 20 as a Florist and Gentleman's Gardener; is a good hand at Budding, Grafting, Layering, Training, Propagating, &c.; is a useful Man; can manage, Stock, Land, &c., if required.—Letters to be addressed G. S. T., Mrs. Hall's, Sydenham Common, Kent.

THE 'FRANKLIN MEMORIAL.'—The existence of the identical press at which Dr. FRANKLIN worked as a journeyman printer when in London (in 1726) having been mentioned in the "Athenæum," many persons were induced to visit the warehouse of Messrs. Harrild, in whose possession it then was, and among them Mr. J. B. Murray, of New York, who expressed a desire that the venerable relic should be preserved in the Museum of the Philadelphia Philosophical Society, as a memorial of his illustrious countryman. To this national good feeling Messrs. Harrild cheerfully responded, declining any price, but, wishing to make it instrumental in forwarding a work of charity in favour of decayed printers, proposed that a donation should be made for that purpose. The Society's constitution precluding any such arrangement, it was at once given unconditionally, and the press is now on its way to America. On its arrival at Liverpool, Mr. Murray, being anxious to carry out the benevolent intentions of the donors, caused it to be exhibited, and a public Lecture was given by the Rev. Hugh M'Neile, on the Life of Franklin. The result was a net sum of 150*l.* So unexpected and welcome an issue has led to the proposal of founding a Memorial of the philosopher, and to make this sum the nucleus of a subscription for the establishing of a pension or pensions bearing his name, in favour of indigent printers. It is proposed to found two pensions, if the funds will admit, one of 30*l.* for a decayed master-printer, whom misfortune has "reduced to the ranks," and one of 20*l.* for a decayed overseer who has served five years in an office with credit, or, failing any such applicant, a journeyman who has retained a situation for the same period—to be called the "Franklin Pensioners." Thus, as was observed by Mr. Murray, "each country will be put in possession of a new Memorial of Franklin: America of her citizen's Press, and England of an endowment bearing his name; directly resulting from the fact of his having worked at an English press; and in accordance with his benevolent and provident disposition." The abovenamed Lecture has been published, and the proceeds of the sale in England and America, and further subscriptions, will be added to the fund; and contributions, not only of the English public, but of the American nation and the Colonies, are confidently anticipated: in short, wherever an English press has been set up (for it has now become universal*) a collection should be made, and contributed to by all who feel that they are indebted to the printer's art for the intellectual enjoyments of social life. The name of FRANKLIN will ever be associated with that invaluable art, and his example serve to stimulate aspiring youth in the pursuit of its exercise. Many are they who have profited by his precepts; and his interesting Autobiography has served for a chart to the young adventurer by which to steer in the voyage of life. Let all those who have so profited—all who have attained success by following his course, look with compassion on those who have foundered or failed in the struggle with adversity. It is hoped at least that in every printing-office in the kingdom a collection will be made; and that every American residing in England will hasten to inscribe his name in so praiseworthy a record, in testimony of his approbation of the FRANKLIN MEMORIAL. The facilities of the post-office will enable every individual to contribute his mite, which will be thankfully received.

Subscriptions will be received by the following Bankers:—Messrs. Rogers & Co., 29, Clement's-lane; Stevenson, Salt, & Sons, 20, Lombard-street: and by Marchant, Smith, & Co., Printers, Ingram-court, Fenchurch-street; and Harrild & Sons, 11, Great Distaff-lane, Friday-street.

---

* So great has been the spread of the art of printing and the English press, that *one* manufacturer has, in the last 15 years, sent out upwards of 1500 presses to all parts of the world! If but a guinea were contributed by each of the respective parties, it would make a sum sufficient for the object proposed.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.

The Second Exhibition will take place on Saturday, the 11th of June. Subjects for Exhibition must be at this Office on Friday, the 10th of June, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition. The Gates will be opened at One, P.M.—Tickets are issued to Fellows at this Office, price 5*s*. each; or at the Garden in the afternoon of the days of Exhibition at 10*s*. each; but none will be issued without an order from a Fellow of the Society.—21, Regent-street.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d*. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s*. for every 25 copies required.

The Gardeners' Chronicle.

	Floricultural	7 P. M.
Wednesday	Medico-Botanical	8 P. M.
Saturday	Royal Botanic	3½ P. M.

LONDON, and, for aught we know to the contrary, the country has been lately inundated with handbills setting forth the wonderful properties of a vegetable prodigy, imported for sale from the East, and called the Everlasting Rose.

"It is a most astonishing thing," says the writer of the handbill in question, "that this Rose, after it has been plucked, will nevertheless retain the power of opening and closing, exhibiting all the appearances of vegetable life for many years, although without a root from which to derive support. The writer has had one of these Roses in his possession for upwards of twelve months, and a relative abroad has had one for as many years. A Roman Catholic bishop in Ireland has had one half a century, which retained unimpaired all the powers of vegetable life, expanding in the form of a very pretty star, and closing up again its numerous little fibres about an hour or two after being taken out of the water. In the East it is highly prized on account of the superstitions there prevalent about it. On receiving a small number last year, it created no little degree of interest among Botanists and persons interested in the seed trade; and it has hitherto baffled all the 'learned heads' to account for its retaining this mechanical power. It was publicly lectured on by an eminent Botanical Society last year, the Fellows of whom declared it to be one of the most extraordinary things they had ever seen. When the rage for making pilgrimages was at its height, and Europe sent forth her inhabitants to the Holy Land, no sooner had the pilgrims discovered the wonderful powers of this little plant than they immediately declared them to be supernatural. They said that God had gifted it with these expansive powers with a view to the conversion of infidels; and with this view it bloomed forth at Christmas-eve to salute the birth of our Redeemer, and paid homage to his resurrection by remaining expanded till Easter, and that its revival from death was a miraculous type thereof! Thus it is also called 'Anastatica,' or the Plant of the Resurrection; and Hierochuntina, because it used to be found in Palestine."

We should like to learn what "eminent Botanical Society" was last year so prodigiously astonished at one of the commonest phenomena in vegetation, presented by a plant as well known to Botanists as the Cedar-trees of Lebanon.

The Anastatica hierochuntina, or Rose of Jericho of the old herbalists, is not a Rose at all, nor has it the smallest resemblance to a Rose; nor, in the state alluded to by the writer of the handbill, is it alive, as he asserts. It is a little grey-leaved annual, very common in Palestine, and of which hundreds may be gathered in full flower in June, by the sides of the road over the isthmus of Suez. It produces a number of short, stiff, zigzag branches, which spread pretty equally from the top of the root, and, when green and growing, lie almost flat upon the ground, having the flowers and fruit on their upper side. It is, in fact, a cruciferous plant, nearly related to the common purple Sea-rocket, which grows on the coast of England, and has a somewhat similar habit. When the seed-vessels of this plant are ripe, the branches die, and drying up, curve inwards, so as to form a kind of ball, which then separates from the roots, and is blown about on the sands of the desert. In the cavity thus formed by the branches, the seed-vessels are carefully guarded from being so disturbed as to lose their contents. In that condition the winds carry the Anastatica from place to place, till at last rain falls, or it reaches a pool of water. The dry, hard branches immediately absorb the fluid, become softened, relax, and expand again into the position they occupied when alive; at the same time the seed-vessels open, and the seeds fall out, when, the place being suitable, they readily germinate, and establish themselves as new plants.

This is, no doubt, very curious; but are not the ways of the Almighty all wonderful? It is, however, no more miraculous than the twisting up of the beard of the Oat when it is dry, and its untwisting when moistened. It is, in fact, the same phenomenon. Has no one ever seen the Animal Oat walking about on a hot, dry day of summer, tumbling and crawling like a paralytic grasshopper? In that case the dead tissue contracts when dry, and relaxes when moistened; and the successive stages of the one or the other produce its singular motions. This Animal Oat used to be commonly cultivated as an annual flower, but is now rarely seen—no proof, by the way, of the good taste of modern flower-gardeners.

All physiologists are aware of similar cases in abundance; for what is the splitting of seed-vessels, and their closing up again when wet, but the same phenomenon reversed? The instance, however, which is most analogous to that of the Anastatica is found in the scaly Club-moss, (*Lycopodium lepidophyllum*, or *involvens*,) which in Peru and Mexico has been as much the subject of amazement as the former has in Europe. In precisely the same manner it spreads its numerous branches flat upon the ground when growing; as it dies and dries, the branches contract, and roll up into a ball; and when the parts are again softened by water, the branches spread, swell, and recover their flat position. In all these cases, the contraction and expansion will take place over and over again, under fitting circumstances.

If this were a vital action we should not remark it, for who vouchsafes to wonder at the opening of a Crocus in sunshine, and its closing in gloom? and yet that is a phenomenon, which, like all vital actions, is quite beyond man's powers of comprehension; but it is so common that we cannot see it. When, however, dead matter stirs, people are amazed, and all sorts of foolish tales are invented by the ignorant to impose upon those who are yet more ignorant, even although the explanation of the cause may be of the most simple kind.

It is a general property of vegetable matter to be hygrometrical, or as some say, and more judiciously, hygroscopical; that is to say, it has the power of absorbing water readily when in contact with it. Were it not for this property, the life of a plant could not be maintained; but the roots absorb water from the earth, all those countless myriads of cells and tubes, which form the fabric of a plant, absorb it from one another as fast as the roots receive it, and in this way fluid is transmitted rapidly and incessantly from end to end, and to every part of a tree. When a plant is alive, this property is much increased in amount by the powerful aid of vital forces; but it is far from being lost when the plant is dead, as is proved by the shrinking and swelling of timber, cordage, and canvas, and by a thousand other circumstances. The Anastatica is only another instance of it.

A SOCIETY is in course of formation for the encouragement of the culture of Pelargoniums; the object of which is to raise a fund, which shall be distributed in prizes to those seedlings of the present year which shall merit such rewards; if the funds prove sufficient a portion will be also appropriated to testing the merits of the best seedlings of 1841. The garden exhibitions of the Horticultural Society appearing to be the favourite place for exhibiting seedling Pelargoniums, the July meeting of this year has been fixed upon, with the consent of the council, for carrying out the objects of the Pelargonium Society. The funds at its disposal will be added to the awards of the Horticultural Society in such proportion as will mark the different degrees of merit of the flowers exhibited. It is to be hoped that this will induce the growers in distant localities to compete with those more favourably situated, in order that a just estimate of their new varieties may be obtained.

We recommend a general subscription among amateurs for this purpose, for they are most interested in the plan. If, as we understand is intended, the names and descriptions of the successful flowers are published by the Pelargonium Society, buyers will at once know what to buy and what to reject.

We may add, that a condition required of the subscribers by the Horticultural Society is, that the nomination of the Judges shall rest with the Exhibition Committee of the latter body.

THE pruning of trees is probably the subject which above all others in foresting is least likely to meet with unanimity of opinion. Foreshortening, lopping, snagging, the preventive system, the remedial system, and similar expressions, of themselves indicate the diversity of practice which finds favour in the eyes of those who have the management of woodland property. We have occasionally published letters from our correspondents upon this subject, and we have now and then ourselves ventured to put our foot upon the debateable ground of arboriculture. We have, however, for ourselves experienced the inconvenience of not beginning at the beginning, and therefore, as it is not our purpose to retract our opinions, or to let the subject drop, but, on the contrary, to keep it before our readers at fitting periods, we now proceed to do what we ought to have done at first, viz., to explain the true principles by which pruning forest-trees, be the circumstances what they may which lead to it, ought to be regulated.

Prune not at all—should be the maxim of a forester. Plant thickly, thin constantly, stop carefully, and leave the rest to nature. But unfortunately it does not happen that he who plants well always thins constantly; it is still more rare that stopping is thought of, and so a maxim, one of the soundest in the whole system of foresting, cannot be observed. Pruning may therefore be regarded as a necessary evil, to which the wise must submit because of the ignorant.

Let us consider why forest-trees should not be pruned at all. What is the object of a proprietor of trees? To obtain for them as much money as he can. What is it in trees that brings the money? Their timber. Therefore, whatever increases the quantity of timber in a given time produces the greatest amount of money. This seems clear.

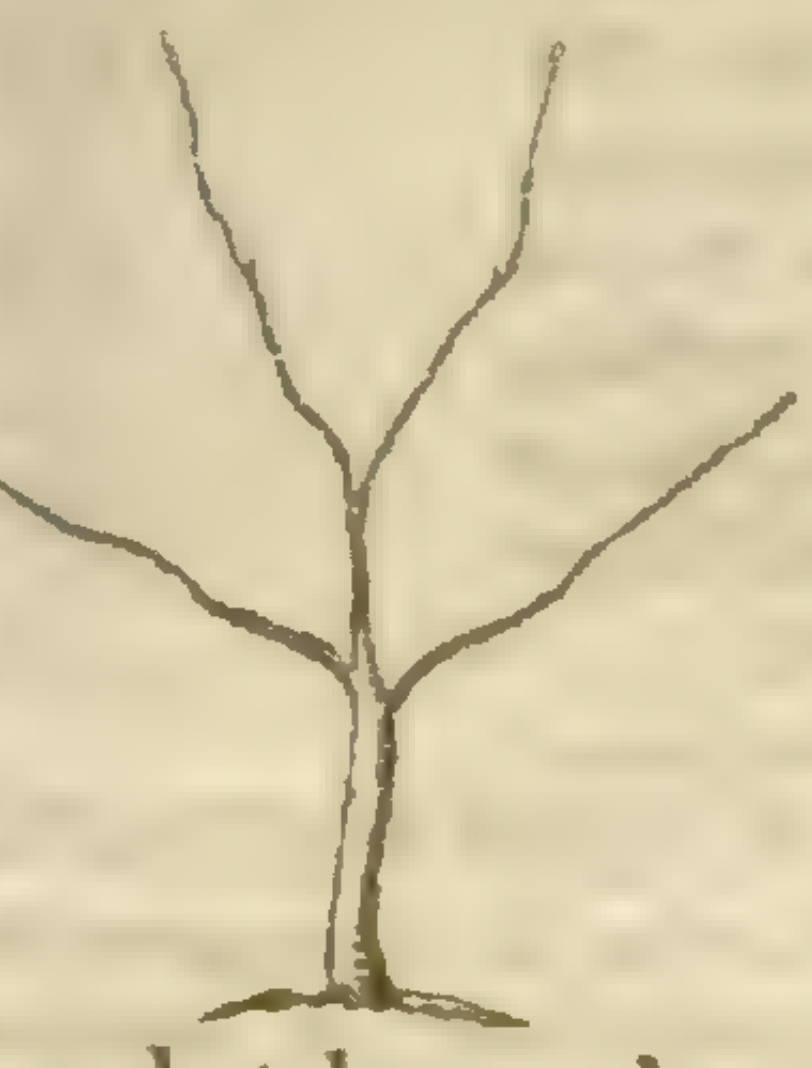
Now, timber is the woody texture of a tree. The woody texture does not form itself; it does not grow independently of all other parts; it is only a portion of a living system, formed by the action of other organs; it is to a plant what flesh and bones are to an animal. The bones and flesh of cattle are not increased in quantity of themselves, but by means of food swallowed by the mouth, and digested by the stomach. To swallow food without digesting it is an entirely useless operation both in the animal and vegetable kingdoms. The digesting organs of trees are their leaves; it is the foliage which forms the stomach of a plant; therefore, to deprive a plant of its leaves is like depriving an animal of its stomach. Emaciation is the consequence in both cases; it is indicated in animals by leanness and debility; in plants, by the loss of woody texture, or timber.

But a plant has not a single stomach, as an animal has; it is covered with stomachs in the form of leaves, every one of which performs its part in the action of digestion, and so contributes something to the formation of wood. Although out of the millions of leaves that clothe a tree many may be destroyed, and no appreciable diminution of the wood be remarked, yet it is most certain that some diminution takes place; when the destruction of leaves is excessive, the diminution will be excessive also. We should be a long time emptying a fish-pond with a tea-spoon; but in time we should succeed; and the only effect of using a pump for the purpose would be to accelerate the operation.

Now what is pruning but the removal of leaves? To cut off a naked branch is not, indeed, to remove a leaf; but it is to remove that part from which many leaves would have sprung had it been permitted to remain. We say again, then, prune not at all—if you can help it.

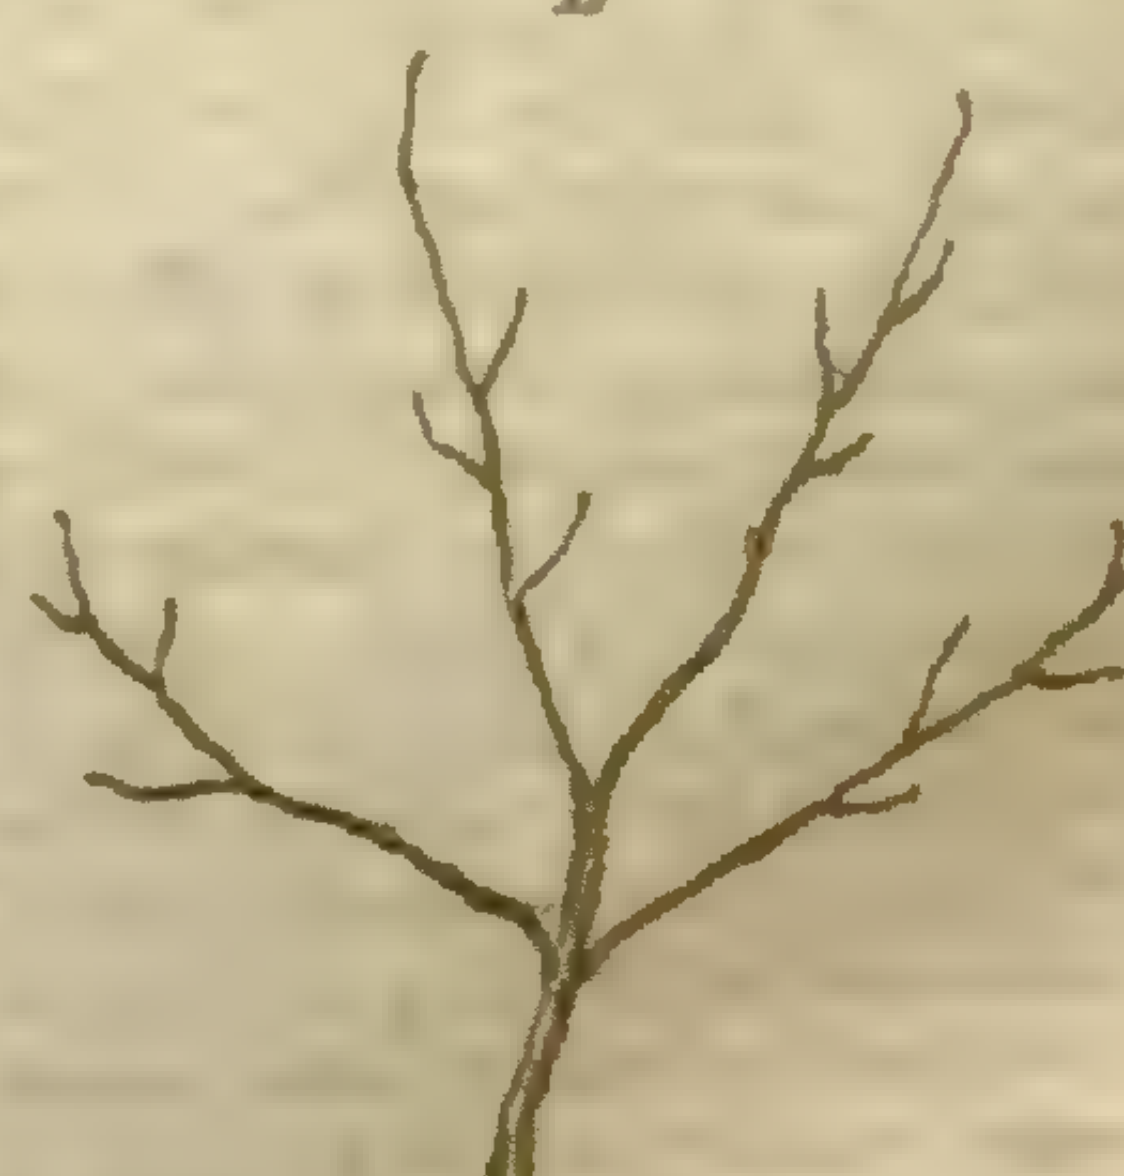
It, however, will be found that when plants are allowed to grow without interference of any sort, even although they are early and judiciously thinned, yet that in some cases they are unwilling to form straight upright stems, preferring to grow "bushy-headed." Accidents often cause this. In such cases artificial means must be employed to give some one branch a lead over the others; but this may be effected by stopping, which is very different from pruning. Pruning is effected with a knife; we would not permit the use of an instrument stronger than the finger and thumb; in any plantation, properly superintended from the beginning, whatever is required in stopping may be so effected.

A



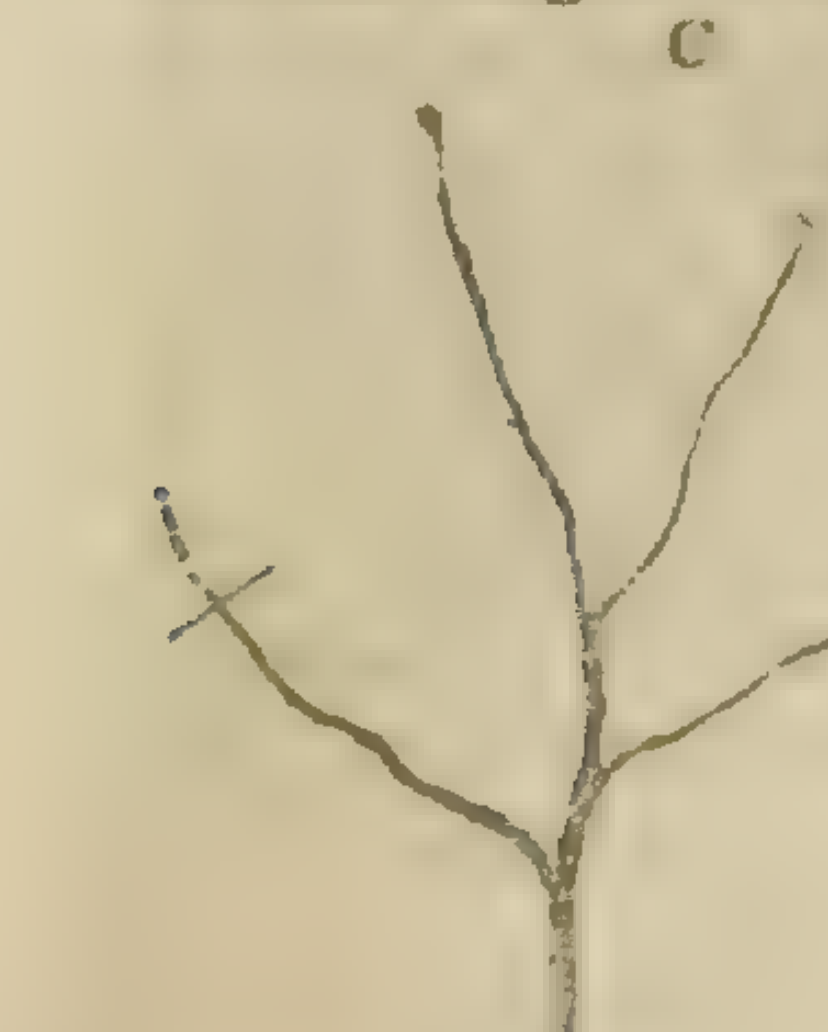
The respective effects of doing nothing, stopping, and pruning badly will be best illustrated by a few diagrams. Let A represent a young tree disposed to be bushy-headed, all its branches being equal. If nothing is done to such a plant, each branch will grow larger, at an equal rate, and produce a few laterals; by the end of a second season the tree will be somewhat larger, but in other respects much what it was before, as is shown at B.

B

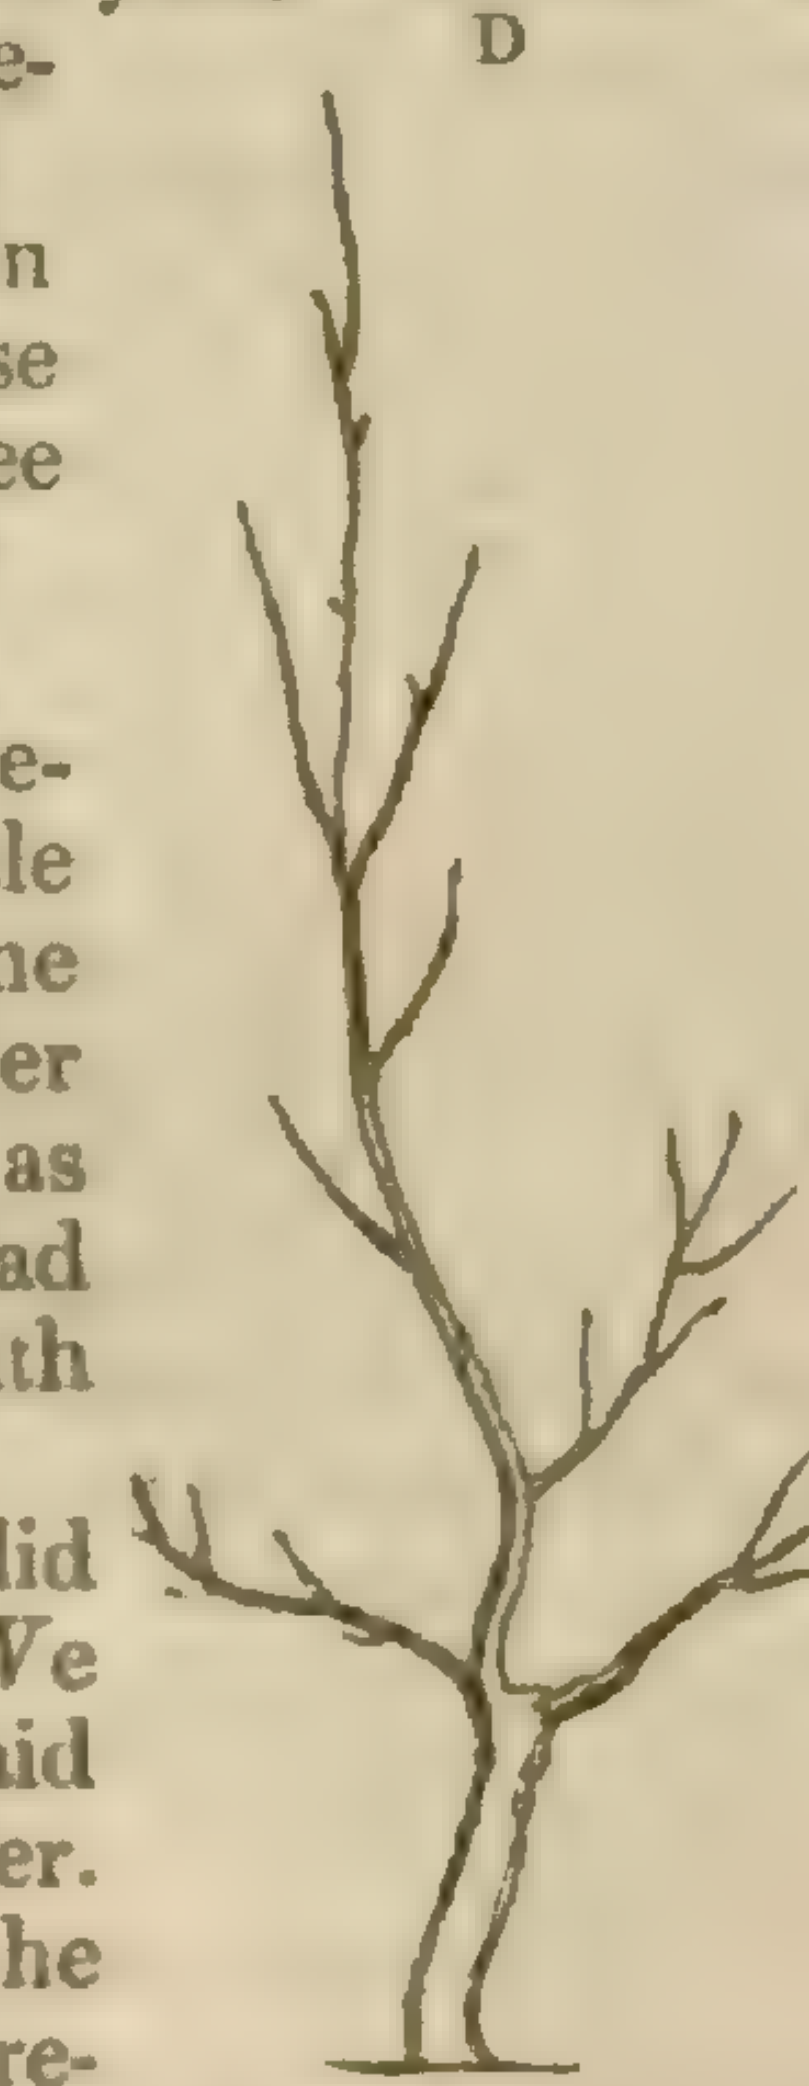


But suppose that A, instead of having been left untouched, had had three of its branches stopped by breaking off their points, as is shown at C. In such a case, the current of sap being arrested in the laterals, would flow strongly into the leader, which would lengthen rapidly, while the laterals would only produce some small spray; and the result, at the end of a second year, would be what is represented at D. In this case the tree would have been very little deprived of its foliage, and yet the production of a permanent leader would have been effected just as well as if the pruning-knife had been plied with industry.

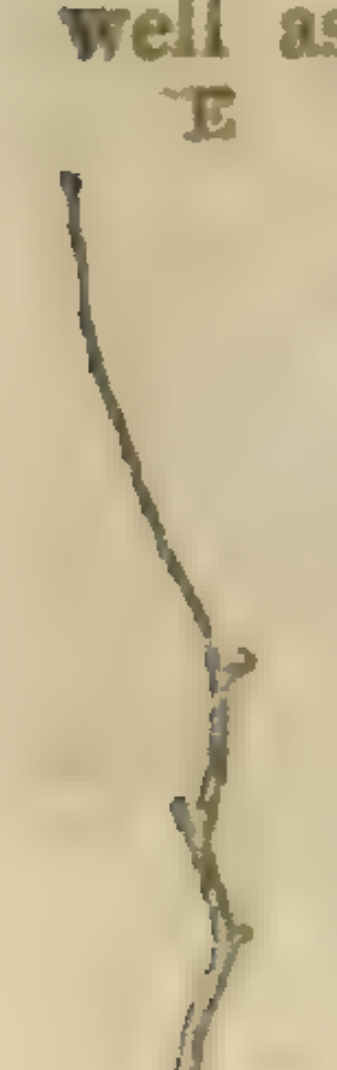
As well, did we say? We should have said infinitely better. For observe the contrast. E represents the same plant A pruned up to a leader by the total removal of its lateral shoots in the usual way. F will show what such a plant may be expected to become at the end of the season, instead of D, which it would have been under the influence of stopping only.



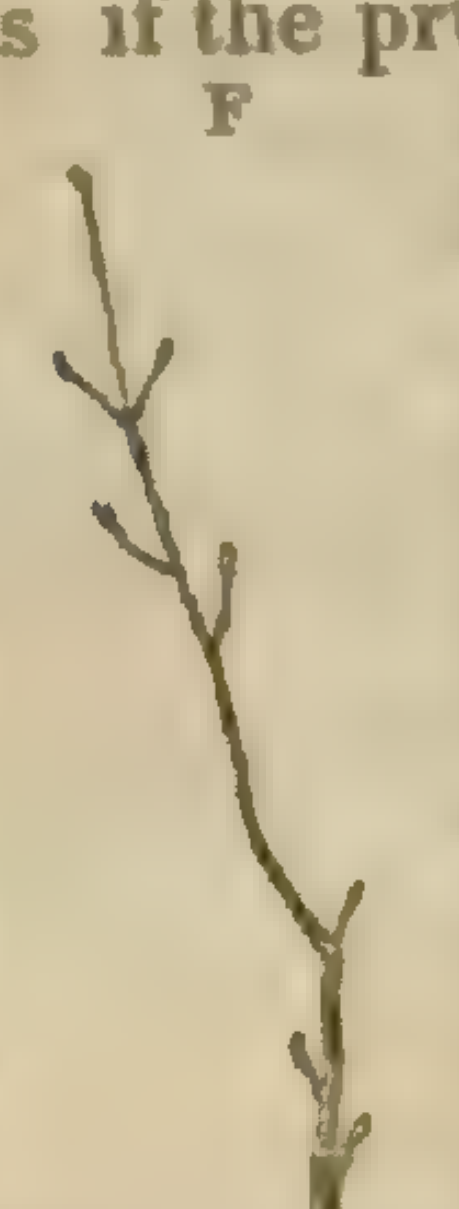
C



D

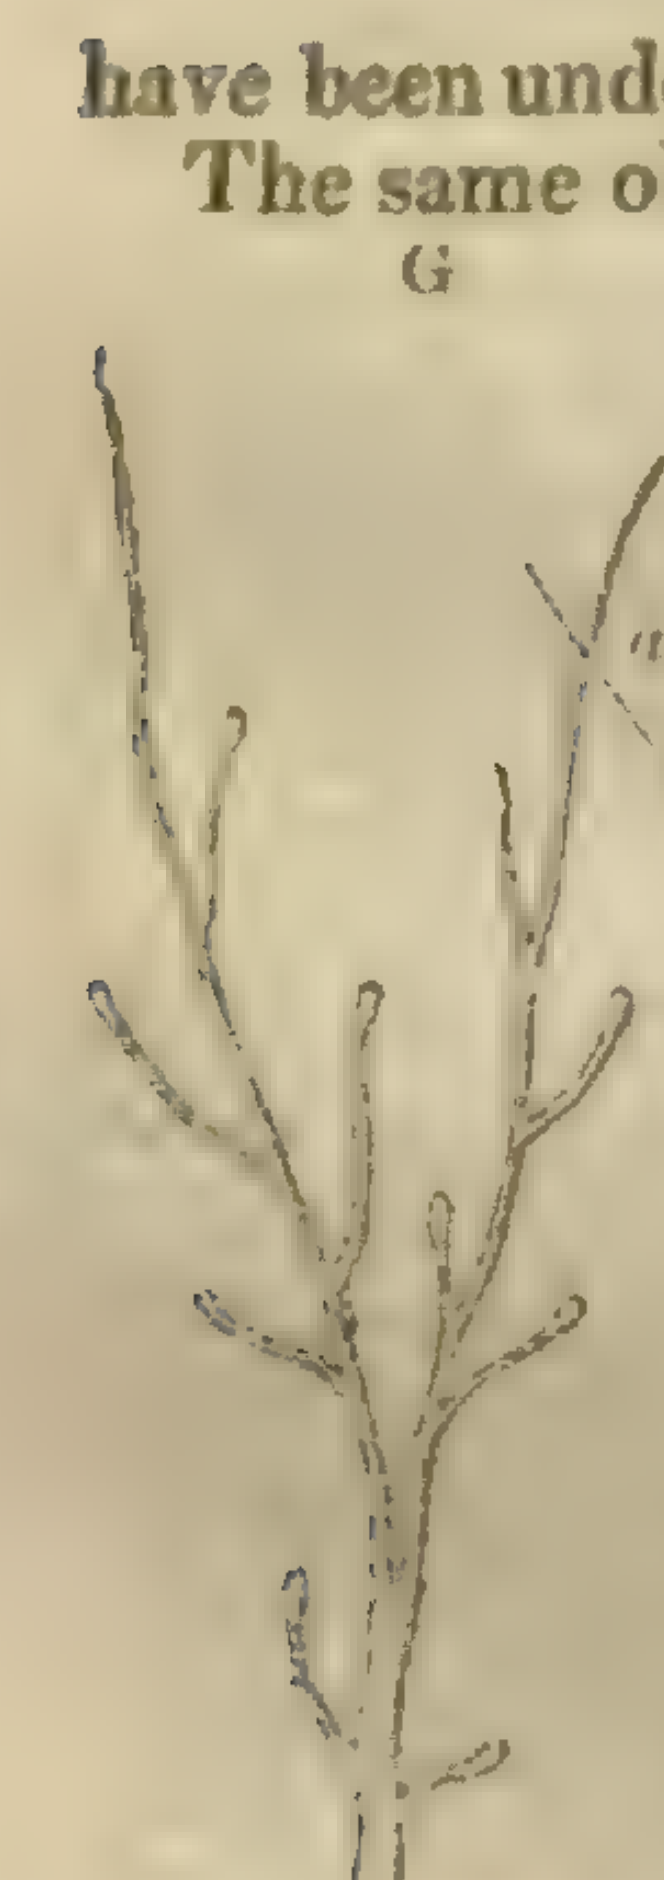


E

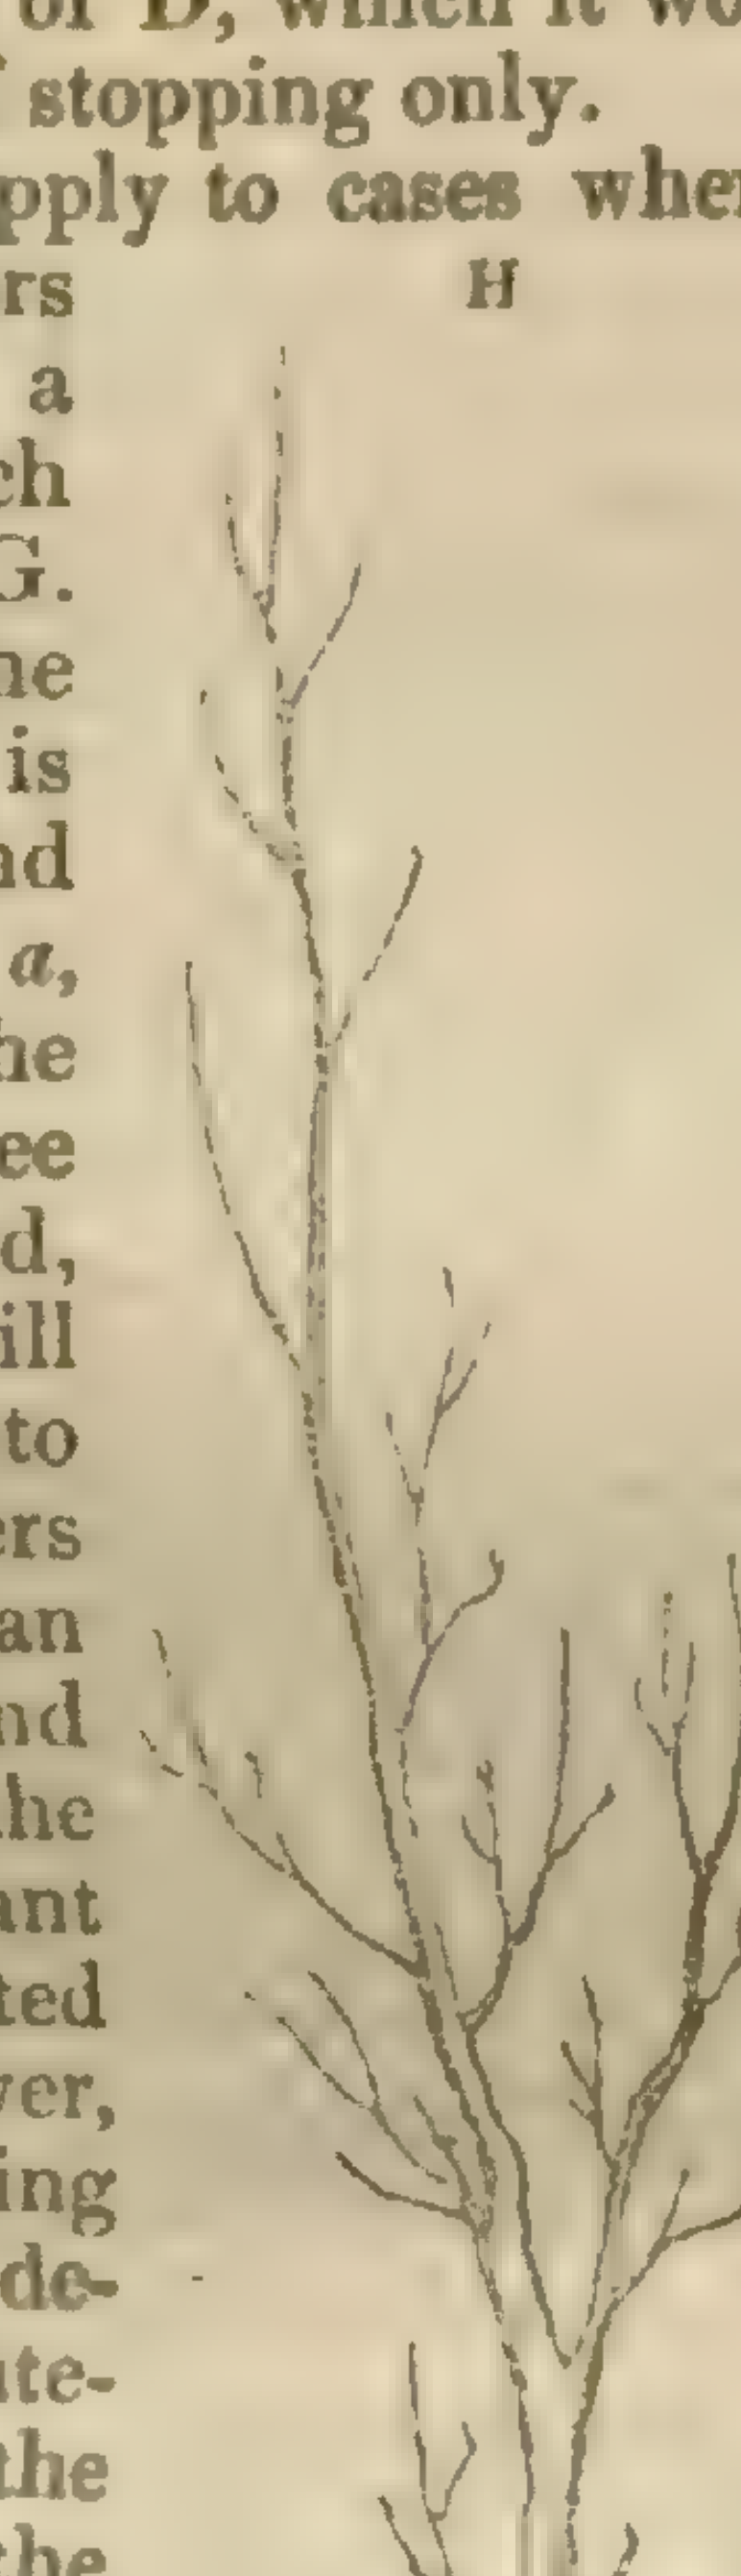


F

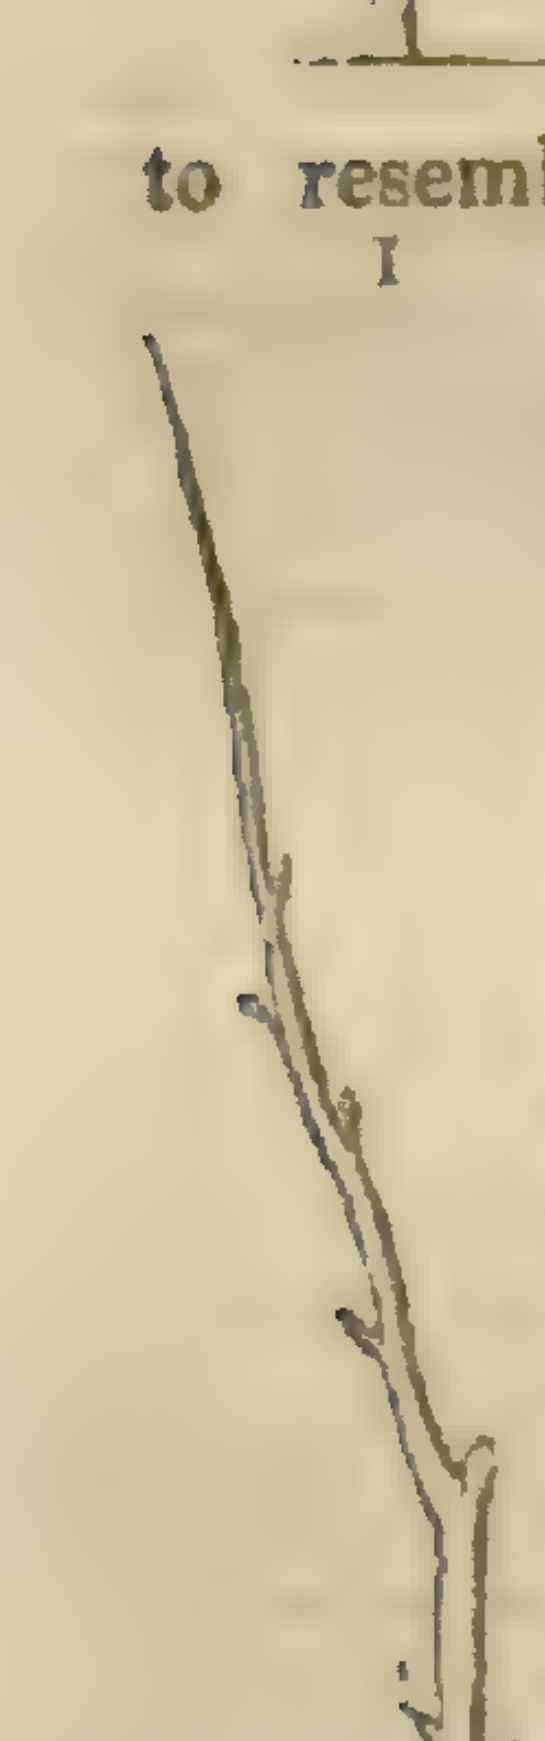
The same observations will apply to cases where a pair of leaders are running a race with each other, as at G. If one of the leaders only is broken off and stopped, as at *a*, scarcely any of the energy of the tree will be destroyed, but the sap will be thrown into one of the leaders much more than the other; and at the end of the season the plant may be expected to resemble H. If, however, instead of being treated thus, G. be deprived of all its laterals, and left by the pruner as at I, the digesting powers of the plant will be so completely removed, that we can hardly expect it to become at the end of the first year better than at K—the difference between which and H we need not insist upon.



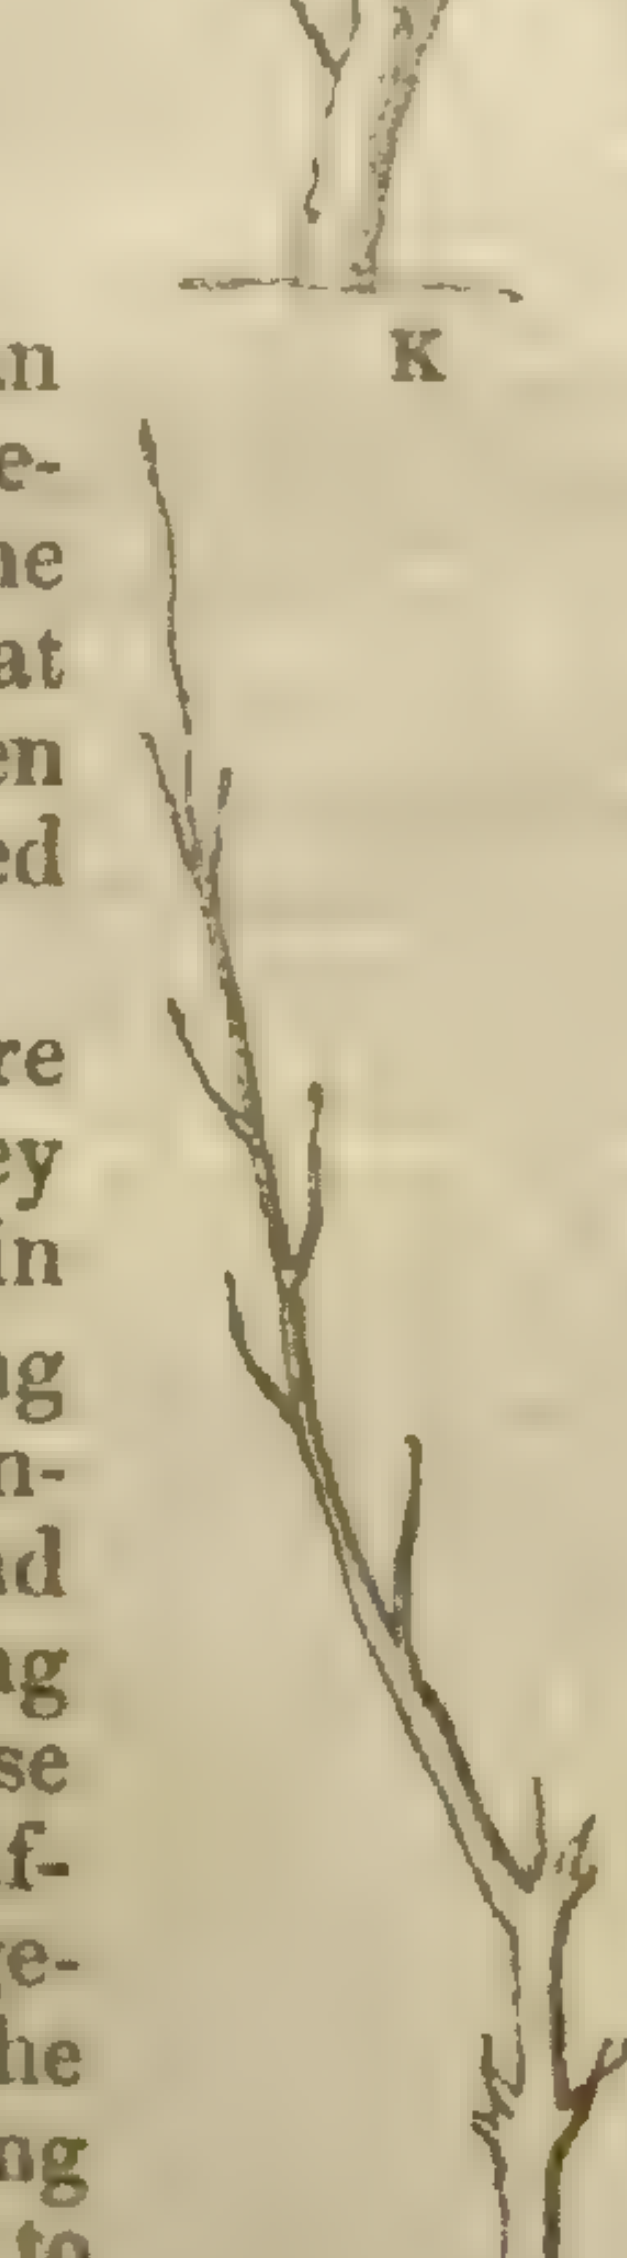
G



H



I



K

If these diagrams are carefully studied, they will be found to explain the whole principles of managing young forest-trees, so far as controlling their form is concerned; and now is the best season for performing that operation. There will of course be many variations and many different cases; but all will be manageable upon the same principles, in the exposition of which there is nothing new, but which, although familiar to everybody, are so dealt with as if they had no existence.

ON TRANSPLANTING HALF-HARDY ANNUALS.

As the beauty of the Flower Garden is in a great measure dependent upon a choice selection of half-hardy Annuals, and as the season is now arrived when they may with safety be transplanted into the open borders, a few remarks upon the best means of ensuring success in the operation may be useful. It must, however, be borne in mind, that the following observations are not addressed to the practical gardener, who stands in need of no suggestions upon this subject; but to amateurs, and others, who take an interest in flowers, and whose success depends upon their own skill. In the opinion of some persons the season for the operation is over; but with this I do not agree: for in nothing is the truth of the proverb, that "Much haste makes ill speed," more strikingly exemplified than in planting out tender annuals, and similar border flowers, which suffer more from night cold than they gain by early planting.

Supposing, therefore, that a sufficient quantity of various kinds have been raised, it will be necessary, in the first instance, to ascertain the habit, height, and colour of each kind, so that a proper situation may be chosen for it; otherwise some of the tallest may be planted on the margins of the beds or clumps, while those of more slender growth may be smothered in the centre. There are also some kinds which look best when disposed in groups or masses, and others which appear to more advantage when planted singly or in small patches; where the garden is of sufficient dimensions to allow of the former, they will be found very ornamental.

Previously to being planted, the ground should be lightly dug, or what is commonly called "pointed over," in order to render it more permeable to the tender roots. There are some, indeed, who, when they have made a hole in the border (no matter how hard it be) of sufficient size to receive a plant, and have squeezed it in and watered it, imagine that they have done all that is necessary for its future support. A little consideration will show the folly of such an idea. The roots, in this instance, are unable to extend themselves in the surrounding soil; and, as the rain cannot penetrate the surface, the plant resembles the poor stunted specimens of vegetation to be met with upon rocks, and, sooner or later, dies from want of nourishment.

If the young plants have been kept potted separately, they may be easily turned out without disturbing their ball; but if they have been reared in seed-beds or boxes, great care will be requisite, that the roots may be injured as little as possible, for upon this their future success will principally rest. Those raised in the manner last mentioned may be transplanted much quicker with the dibber than with the trowel; but I am of opinion that the latter implement is by far preferable, since, in dibber-planting, the roots are all huddled together, and are so placed that they have no alternative but to descend perpendicularly; and unless this operation be carefully performed, there is generally a vacant space left in the ground immediately below the roots. It will also be found beneficial, instead of turning annuals out singly in the borders, to arrange three together in the form of a triangle, and to plant them a little deeper than they originally were; because, by this means, many will be encouraged to throw out fresh roots above the neck or collar.

After they are firmly planted, a small basin should be formed around them, by drawing some of the surface soil within a few inches of the stems; the basin should be filled with water two or three times, until the ground is completely saturated. Advantage should be taken of showery weather for transplanting these tender subjects, as many of them, if removed during a hot day, will never recover from the check which they receive. If the weather is dry, the evening is the most suitable time; and on no account should the watering of those newly planted be neglected, until they have taken firm root-hold, always choosing either the evening or the early part of the morning for this purpose. Numerous plants, if watered while the sun is upon them, die off even with the surface of the ground; to this, many failures may be attributed. The necessity of frequent waterings may be greatly remedied by shading the young plants with fir or other boughs, of a foot or more in length, firmly placed between them and the sun. Those which are drawn up or weak should be carefully supported with small twigs, as recommended at p. 286 of the *Gardeners' Chronicle;* and all, particularly climbers, should be regularly tied up as they advance in growth, otherwise they are liable to be broken by the wind.

It is difficult to preserve Annuals from the attacks of slugs, and, as lime has a very unneat appearance in a flower garden, we recommend those who are annoyed by such creatures to employ children to collect them from the plants every evening; by which means their numbers may be quickly thinned.—*T. R.*

RAMPION.

THIS Campanula Rapunculus being grown in many places for its edible roots, and being rather shy in its cultivation, a short account of its treatment may, perhaps, be interesting to some of your readers. Having chosen an open piece of ground, I procure as much sand as will be sufficient to cover it two inches deep; but before laying it on I saturate it with manure water. It is then spread over the surface and well mixed with the soil to a spade's depth, by turning it two, three, or more times, according to the friability or adhesiveness of the ground, till it is nearly as fine as if it had been sifted. Having raked it perfectly smooth after the last turning, it is marked off into beds of any convenient width, and these again into drills six inches apart, and from a quarter to half an inch deep. The drills are formed by slightly pressing upon the surface the angle of the garden measuring-rod; into these the seeds are dropped and covered with the back of the rake. When the ground is naturally light, rich, and free, such sanding and turning may be dispensed with; but when the contrary occurs, some such means should be taken to render it permeable to the roots of the Rampion, which are much given to fork, and then become unfit for use. They may be sown anytime from March till June inclusive: although liable to run, a sufficient number of the first sowing will stand for a crop; I have found that a part of the last sowing will likewise run. —*J. Halliday, Elmham Hall.*

AMATEURS' GARDEN.—No. XXIII.

ALL the hard-wooded greenhouse plants, which have flowered, may now be removed to a sheltered situation in the open air. Here they will require less care than when kept in the house; and by being watered with the evening dews and summer showers, their leaves will soon assume that deep green colour, which is a sure sign of health. A situation should be selected for them which is partially shaded from the hot mid-day sun, but exposed both to the morning and evening rays. Sometimes we see them placed under large trees, but this situation is not to be recommended where a better can be obtained. Another important point is, to place the pots level and on a good solid piece of ground, because worms are very apt to come up into the soil and choke the drainage. This is, perhaps, most simply done by a thick coating of coal ashes, which, if watered before the pots are placed upon them with a strong solution of nitrate of soda, will remain moist for a considerable time, and will also prevent, to a certain extent, the worms from getting into the soil in which the plants are growing. Lime water is also an excellent material for destroying these pests, and may be used in the same way as the other solution. But although these substances prevent, to a certain extent, the injury from being done, they do not altogether cure it; a slate or stone pavement, or some kind of asphalte, through which the worms cannot penetrate, is the only effectual remedy; but of course more expensive.

Pelargoniums which have been grown in the greenhouse will now be in full bloom; if some of them can be spared to put in rustic wooden baskets, in sheltered situations in the pleasure garden, they will flower finely and have a pleasing and exotic appearance. The same thing may be done with Fuchsias, Mesembryanthemums, and other summer flowering plants.

The arrangement of the beds and borders for the summer being now completed, nothing farther will be required except occasional watering in dry weather, and keeping the whole neat and free from weeds. The amateur must now turn his attention to the staking of herbaceous plants and to the pruning and nailing of wall trees. If his walls are covered with Roses or other trailing plants, the young shoots must be fastened to the wall and kept from being broken by the wind. In many instances it will be found necessary to thin them, but this must be carefully done, removing only the strong "water" shoots; shortening those which are weak, and fastening up the others which are more likely to form flower buds for another season. The summer pruning of Pear and other hardy fruit trees upon walls should now be commenced; the management of the Peach and Vine was described in a former article. Too many shoots ought not to be shortened at one time, as the tree by this means receives a check which is very injurious to its health. First of all, the main shoots, or those which will not be removed next winter, ought to be trained in; then part of the front ones, or those which will be cut in as "spurs" at that time, should be shortened; and thus gradually week by week shortening a few more, and so throwing the strength of the tree into that wood which has now commenced to form fruit buds for another year. Much must be left to the good sense of the amateur, for if the tree forms but few shoots, none of them ought to be removed or shortened; and in all cases the operation need not be carried farther than to prevent a quantity of useless wood from being formed, thereby shading and preventing the rest from being acted upon by sun and air.—*R. F.*

HOME CORRESPONDENCE.

Chemical Analysis of Plants.—If a new living animal —a bird, for instance—were presented to a person ignorant of zoology, one of the first questions he should ask would perhaps be—"What food shall I give it?" What is a proper question for animal is equally so for vegetable life. When a new plant, therefore, is introduced, the question ought to be asked—"*What does it feed upon?*" Cultivators have hitherto contented themselves with a vague general description of soil—such as a strong soil, a sandy soil, or heath mould, &c., as the case may be; but chemistry and Liebig would tell you what the constituents of the plant are, and what materials must be present to enable the soil to furnish those constituents to the plant—otherwise it would starve, as certainly as a sheep would in a well-furnished butcher's stall, or a tiger in a full haggard. Take as a practical illustration of this principle the beautiful tribe of Rhododendron; how luxuriant in certain localities—what yellow, sickly invalids in others. Whence this great difference? "Oh," cries your common-place routine gardener, "avoid the limestone; plant them in peaty ground, such as produces heath," &c. This generally contents the ordinary class of cultivators; but I have seen fine Rhododendrons where limestone was abundant, and equally flourishing plants growing in a clay loam too stiff for garden purposes. No, some element is absent which is essential to produce a vigorous Rhododendron in the case I allude to; and the object of this letter is to intreat some of your chemical friends to take up this one tribe, and by an analysis of a Rhododendron, to tell us what quality we must impart to the soil to ensure a healthy plant. Were this followed up by similar experiments on other marked species of plants, I feel a strong conviction that we should see at horticultural exhibitions specimens far exceeding anything yet witnessed, even from the best gardens.—*Ortolano.* [We perfectly agree with this correspondent, whose opinions are worthy of Mr. Edward Solly's most serious consideration.]

Caveat emptor.—To those persons who may be disposed to use Dr. Horner's remedy for the plague of cockroaches, the following anecdote may serve as a useful warning. If there be any domestic pest to warrant the practice of "strewing poison about the premises," (as one of your correspondents expresses it), those who have suffered the disgust of this truly Egyptian one, will allow it to be worthy of such "leprous distillations." I did myself once try the use of several arseniacal pastes—but the wary creatures "would not bite;" and I must confess that the anxiety I felt whilst the remedy was in trial, lest some unhappy accident should occur from it, made me give it up sooner than I intended. But in spite of this, and of the result of the poisonous experiment I am about to relate, if I were not quite satisfied of the efficacy of my present practice, I should be tempted to try Dr. Horner's potato preparation. Being this spring more than usually annoyed by the chaffinches, and other small birds, amongst my young radishes, and other spring-ing vegetables, I steeped some corn in a solution of white mercury, and some also in another solution of arsenic, and strewed it on the seed-beds. As far as the birds were concerned, the experiment did not take effect—nor was I at all more successful with the strychnia, or nux vomica. As cunning as cockroaches, or as a trout when there is a man's shadow on the water, and wisely surmises that—

> "Your horrid fly but serves to hide
> A still more horrid hook"—

they would not swallow the bait. But, about six weeks after, a fine, healthy pig, of eight months' growth, one of four pretty grunters (as fat and sleek as any of the aldermen who did *not* live in the mayoralty of the civic hero whose cat kittened in the kitchen grate), sickened suddenly, and died after an illness of six hours' duration only. On the most careful examination, no signs of disease appeared in the animal, except such as might arise from some recent violent irritating cause in the stomach and intestines. Its companions remain in perfect health; and I have very little doubt that this one was poisoned by some of my bird-bane having got into the yard amongst weeds, cabbage leaves, or other rakings from the garden. Once more, I am sure those of your friends and correspondents who suffer the annoyance in question, will thank you for the information elicited by the renewal of the inquiry—and Dr. Horner also, for his simple plan, though it may be attended with some danger. And, moreover, there are now so many "infallible remedies" before the public as at least to remind us of the old adage that, "there are more ways of killing a dog than by hanging him."—*P. P.*

Pruning Forest Trees.—I am not an advocate for pruning forest-trees to any great extent: to some kinds, as the Silver and Spruce Firs, it is very injurious, from the emission of resin at the cut places occasioning them, as it is vulgarly called, to bleed almost to death. Sycamores also, if pruned after November, discharge an immense quantity of sap: it is therefore better, if room be wanted, to cut these trees entirely away than to prune them. Larches do not seem to suffer so much as either of the above; but Scotch Firs are much hurt by pruning, although perhaps not so severely as the Spruce and Silver, which, when mangled in the barbarous manner recommended by some persons for other trees, seldom grow much for several years afterwards. Oak, Ash, or any other hard wood, may be pruned with less fear of injury; still I think, if it can be dispensed with, it is much the best plan. Any very deformed branch may be taken off, without dressing the trees up like a parcel of broomsticks. When it is practicable to have a plantation of Fir-trees by themselves, I would never prune them at all: Dame Nature (whose works are too much opposed by those of art now-a-days) will perform that office much better without any assistance. When the trees crowd upon each other, the under branches die off without that check which is produced by cutting them off. Whatever ridicule may be attached to those who prefer having trees as straight as ramrods or hop-poles, it must be admitted that Firs cannot be too erect; and it is impossible to grow them straight unless they be planted thick, and as few as possible taken out at the first and every subsequent thinning. No general rule can be given for such operations; but I generally allow the trees to become large enough for fence-railing or something of the kind, before I thin out to any extent; but when the trees are evidently taking harm, which experience will easily detect, they should be thinned out immediately. I might here remark, a high wind is as likely to blow down trees, growing in the bottom of glens or ravines, as upon the tops of hills or other elevated places; at least I have always found it so. This is illustrative of the wisdom of that Providence which has directed the tree upon the hill-top to make itself more secure in the earth than its neighbours in more sheltered situations.—*S. N. V.*

Extraordinary Vitality of the Larch.—If you think that the following account of the growth of a Larch is worthy of notice, or that it will interest any of your readers, perhaps you will give it a place in your journal. Having occasion, in the spring of 1836, to cut a straight line through a high plantation, I placed, at intervals, some Larch poles, about twenty feet high upright in the ground with small flags at the top, for the purpose of marks. These poles had been cut down at the end of the preceding year, and had been lying all the winter in the wood-yard. One of them, being at the extreme end amongst the trees, was, by chance, left in the ground. During the following summer it made several shoots at the top, the leading one about fifteen inches in length. The circumstance was not particularly noticed, as I attributed it to the effect of the sap remaining in the tree; the pole, however, was left in the ground, and it has during each successive year continued to throw out fresh shoots, though not so strong as those of the first year, and it is now alive and growing. The pole was cut down in the usual way above the ground, it was placed in a hole about eighteen inches deep, without any care, and from my having been a good deal absent no particular attention has been paid to it; indeed, it was so loosely fixed, that being blown about by the wind it has worked a hollow space all round it. It is about twenty-two feet high and measures thirteen inches in circumference, two feet from the ground. The weight of the small flag which remained at the slender point for two or three years has weighed it down, and given it a curve, which it retains. The soil in which it is placed is a poor gravelly loam, which has been trenched. —*H. W. R.* [Although this communication is anonymous, we can assure our readers that the fact, extraordinary as it is, may be confidently relied upon. We have a somewhat similar case within our own observation, which we may some day bring forward.]

New Laburnum.—I send a specimen of a Laburnum raised from seed, which is a great beauty; the flowers are more deep in colour, more numerous than in the old kind, and the racemes are very long, sometimes as much as 15 inches. The habit of the plant is intermediate between the weeping and the common kind, throwing out very long pendant branches; it is a free grower.—*J. D. Parks, Dartford.* [This is a very handsome, well-marked variety, far more brilliant than either of the old kinds, and extremely well worth cultivation.]

The Prangos Plant.—The account given in the last Number of the *Gardeners' Chronicle* of the Prangos from Ludakh as a fodder, induces me to trouble you with this, to suggest that plants may be introduced in Ward's Box: and that if it is anything approaching the description there given, and to be produced on poor land, the Agricultural Society should offer 500*l.* for 100 plants of it, or for 1 lb. of seed on its vegetating.—*D. Z.*

Hellebore Powder and Gooseberries.—In the *Gardeners' Chronicle* of May 28th, I find your correspondent, Surreyensis, says, "that he has put some of the caterpillars under a glass and covered them over with Hellebore Powder; and that at the expiration of 20 hours he found them still living;" so that, in his opinion, Hellebore Powder is quite useless. I, therefore, beg to state an experiment which I have made on rather a large scale; for I had about 3,000 Gooseberry trees covered with caterpillars; so much so, that in a few days there would scarcely have been a leaf left on the trees, unless the insects had been quickly destroyed. I sent to Messrs. Savory and Moore's, Chemists in Bond-street, for 6 pounds of White Hellebore Powder, to try the effect of that quantity at first, and I found that it instantly killed all the caterpillars upon every tree on which it was dusted; this was done by means of a large tin pepper box. I found the powder answer so well, that I sent for 16 pounds more, and dusted the remaining trees with it. It has completely killed the caterpillars upon them all; so that I cannot think that the powder which Surreyensis used could have been of a good quality. I would therefore recommend him, before he entirely condemns it, to try the effect once more, with some powder procured from Messrs. Savory and Moore's, and to let the public know the result.—*D. G. Cropston, Leicestershire.* [The fact is, that many of the drugs from the vegetable kingdom, sold by second-rate druggists, are kept till their active properties are gone. The properties of vegetable drugs cannot be preserved for ever, like those of minerals, but are lost after even a few months, in some cases. If we practised medicine and lived in the country, we should grow and prepare as many as possible of our vegetable drugs in our own garden.]

The Wireworm and Dahlias.—The latter end of last week I planted out upwards of 100 choice Dahlias, and within the last three days I observed that twenty-three of them had drooped very much. I last night took one of them up, and to my great surprise found several wireworms about the root. They had completely eaten through the plant, and two of these insects had buried themselves in the stem. Upon taking up the rest of the Dahlias I found this to be the case with the whole twenty-three. Can you oblige me with a remedy to destroy these creatures, at all events to keep them off. Since writing the above I have been to look at them again, and find two more gone, so that I much fear for the safety of the remainder.—*Frederick Chase, Luton.* [We regret to say that we have no remedy for this pest. Nothing seems to kill the wireworm except boiling water, or crushing him to pieces. Perhaps, however, spirits of tar, applied as in the case of Carrots, might keep him off, by its disagreeable smell.]

Mildew in Peas.—P. Mackenzie's opinion of the cause of mildew in Peas is contrary to my experience. The soil of the main garden here is a perfectly dry sand, but my late crops of Peas are always affected with mildew; whereas in a small garden, in a swamp (chiefly used for growing Strawberries and Raspberries), I sometimes contrive to sow a late crop of Peas, which are perfectly free from that disease. I have had three as fine crops of Waterloo Peas during the month of September as any one would wish to see; while on the dry soil, and sown at the same time, there was hardly a pod worth gathering. The two last autumns having been so wet, may perhaps account for the mildew not being so prevalent on Peas; this, I have understood, is different to that which affects Peach-trees—the latter being most liable to it in cold damp weather.—*J. M., Cley Hall.*

Spirits of Tar and Carrots.—One of your correspondents recommends spirits of tar for Carrots. Last year I had a bed sixty yards long; I tried as an experiment about five yards, sowing the spirits of tar, mixed with dry earth, at the same time as the seed. From the piece sown with spirits of tar, I had a good crop of clean Carrots, whereas the piece sown without them was, in August, covered with and almost eaten up by the fly.—*A Young Cottager.*

Viper Catching.—If your correspondent "Totty," who stated that he was much alarmed by the appearance of a viper in his garden and wished a mode suggested for its capture, has not yet rid himself of the reptile or reptiles, he may try the following, which I think will be successful. The habitation of the viper is in a hole in the bank; he must ascertain the locality of this as nearly as he can, at all events he can make out in what part it is most frequently seen; then let him take a young green frog, and tie a common eel-hook, with line attached, flat upon its belly, that it may not impede the viper's gorging it; this should be fastened to a stake with a sufficient length of cord to permit its being carried to the bottom of the retreat of the viper, which will in all probability, if the weather be warm and bright, speedily swallow the frog, retire to his hole to digest it, and be caught by the hook, thus liberated from the bait. One cannot help feeling for the poor frog, but he very likely would sooner or later meet with this death if at liberty in the neighbourhood of the beast. If the retreat of the viper cannot be ascertained, a large coloured feather may be tied on the end of the string, by which its progress may be readily traced.—*J. B.*

Crop in Chickens.—A correspondent will find that Garlic roots are the best cure for crop in chickens.—*M. Field, St. John's Wood.*——For the information of your correspondent, I beg to state, that if he will only mix up some "calcined magnesia" with a little water, and roll it up about the size of an ordinary pill, and give his fowls one, fasting, every other morning for a week, at the same time not allowing them, during their illness, anything but soft food, such as sopped bread or boiled Potatoes, his poultry will soon recover their health. Should they be turkies, of course his pills must be made somewhat larger. I used to lose a great many fowls annually, but since I accidentally discovered this remedy, I have never lost one from sickness. The fowls should not be fed for an hour after taking the pill.—*L. G.*——Either soot or Rue chopped fine and mixed with butter given to chickens attacked with this disease, every morning and evening, will speedily cure them. Where chickens are kept in great numbers, Rue and Wormwood should grow plentifully.—*Muscipula.*

Mills' Improved Pits.—Will you likewise state that the Cucumber plants, mentioned at p. 349 of the *Gardeners' Chronicle*, as growing so luxuriantly in one of Mills' improved pits, were watered copiously twice a week with pond water, which is from the farm yard, and is replete with certain matters (as Jekyll said in a certain case of nuisance) which, in solution, are highly nutritious, and consequently induce great vigour in the growth.—*T. H.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

June 3.—To-day Mr. Solly's lectures were brought to an end by an exposition of the manner in which Manures are found by chemists to operate. When a plant decays, the green succulent parts are first decomposed; water, carbonic acid, ammonia, and other substances being evolved. The woody and more solid parts of its structure resist decay for some time, or rather, decay more slowly, gradually evolving carbonic acid, and at last constituting what the chemist calls *mould*. Whilst in the act of thus changing, they constitute *humus*. In fact, any brown decaying matter in the soil is called humus: and the term is an objectionable one, as the nature of the substances called by it is very variable. Whether organic matters of this kind in the soil are called humus or by any other name, there is no doubt they have considerable influence on the growth of plants, by which they present a constant regular source of carbonic acid, and probably of other matters, although, according to the views of Liebig, the former is the only end they answer. We know that plants impoverish the soil more or less, some taking up carbon—others, earthy matters; and it is in order to keep up the fertility of the soil that manures are used, and systems of rotation of crops and fallowing are adopted. Mr. Solly pointed out the division of manures into two kinds—*organic*, or those which supply carbonic acid and ammonia; and *inorganic*, or those which supply the earthy matters which plants remove from the soil. Of the organic manures, the most valuable are those which yield ammonia, and other compounds of nitrogen; and amongst them are all animal refuse, guano, gas-liquor, soot, and many others; of the latter—those which yield alkali, flint in a soluble state, phosphates, &c., such as ashes of all kinds, road-scrapings, bones, and so on. With reference to this very important part of his subject, he particularly dwelt upon the value of Ammonia, the sources whence it is supplied, and the means that exist of preventing its loss, by changing it from a volatile to a fixed state; he showed it in guano, in gas liquor, and elsewhere; and he particularly called attention to the property which many earths and more metallic oxides have of condensing it within their pores, slowly to part with it again. Oxide of iron was shown by a good experiment to possess this quality in an eminent degree. We have no space for the many curious matters that were here brought forward, or to explain the valuable hints thrown out about the sources from which inorganic matters are obtained. It would, however, be a serious omission if we were to pass by the exceedingly curious experiments introduced to show how plants obtain the abundance of flint which we find in their structure. Flint is one of the most insoluble of all substances, as people commonly suppose; nevertheless, by mixing it with alkalies and water, it is dissolved, and reduced to the form in which plants can readily take it up. Flint in a fluid state, that is to say, silicate of potash, was produced; in this condition it was capable of being absorbed by plants; then, by the addition of a little vegetable acid, it was restored immediately to its solid state, which is just what happens to it in the interior of a Grass, or other living vegetable body. In conclusion, the greater importance of mixed than simple manures was alluded to; and a most interesting series of lectures was concluded, by the expression of a confident opinion, that, in a very few years, the difficulties that now surround an exact appreciation of the whole bearing upon vegetation of chemical agents, will have been much removed.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

May 18*th.*—The Duke of Richmond, K.G., in the chair. F. C. Cherry, Esq., was elected a governor, and 27 gentlemen, members. Professor Liebig and Mr. H. Colman were elected honorary members. Col. Wood, M.P., presented samples of Swedish Turnips which had been completely preserved during the winter, and gave the following account of the method which had been adopted:—After being taken out of the ground on the 11th of December last, they were trimmed, and put in heaps between four wattle hurdles lined with a little barley-straw, with which the tops of the heaps were also thatched. The heaps were opened on the 1st of April last, when there was not a bad Turnip to be found. These hurdles were set up in the field where the Turnips were grown, and the Turnips were piled within them until they rose to the form of the slanted roof of a house; the thatch was then put on sufficiently thick to keep out the rain; and Col. Wood supposed that the Turnips were kept sound by the air circulating through the hurdles; which would not have occurred had the Turnips been earthed. Mr. Hillyard communicated the following results of his own experience on this subject:—For sheep, the Turnips should be got up, topped, and trimmed before winter sets in: thrown clean and dry into pits about five feet wide, and about two deep; piled up and formed into ridges, and covered over first with haulm, and afterwards with the mould; thus made secure against severe frost—for Turnips which have been frozen, although the frost in time will go out of them, never become of the same previous good quality. They are of course cut and consumed near the heaps. Those parts of the field should be chosen for storing which are the thinnest of soil, but not in sheltered situations, for such parts are sure to be sufficiently manured by the sheep. Turnips thus secured are as good in March as they were in December.

May 21st.—Duke of Richmond, K.G., in the chair. The Earl of Hardwicke, and E. S. Chandos Pole, Esq., were elected governors.

May 23d.—The Duke of Richmond, K.G., in the chair. 38 gentlemen were elected members. Lord Kilmaine was elected a governor. C. R. Colville, Esq., M.P., was appointed chairman of the local committee of the annual country meeting, to be held at Derby in 1843.

May 23d.—Anniversary Meeting.—H. Handley, Esq., President, in the chair. The President announced the change which had taken place in the mode of conducting the elections of the Council, for the purpose of enabling the members to exercise a more distinct freedom of election; and nominated Earl Spencer, Mr. Morton, and Mr. Wingate, scrutineers to report in writing the result of the election. The Duke of Richmond moved that the Earl of Hardwicke be president for the ensuing year, and to preside at the country meeting to be held in 1843, at Derby. Mr. Jonas seconded the motion. The trustees and vice-presidents were re-elected. Mr. Barclay, M.P., Mr. R. Barker, Mr. Burke, Mr. Blanshard, Mr. Ellman, Mr. Grantham, Mr. Webb Hall, Mr. Hayter, M.P., Mr. Hillyard, Mr. Hobbs, Mr. Jonas, Mr. Kimberley, Mr. Kinder, Sir C. Lemon, Bart., M.P., Mr. Page, Mr. Shaw, and Mr. Thompson, were re-elected members of the Council. Hon. G. H. Cavendish, M.P., Sir H. Hoskyns, Bart., Mr. Chandos Pole, Professor Sewell, Hon. Capt. Spencer, Mr. C. Stokes, Mr. G. Wilbraham, and Col. T. Wood, M.P., were elected new members of the Council. Col. Challoner read the various balance-sheets of the accounts. There was only one item, he observed, that was a drawback on the satisfaction he felt in reporting the schedule of the finances to the meeting, and that was the sum of 940*l*. charged against the funds of the society, as the excess of expenditure at the Liverpool meeting over the receipts on that occasion. He also adverted to the existence of a large amount of arrears due to the society by the Fellows. Mr. Flight expressed himself surprised and indignant at the great amount of arrears; and recommended that a list of all defaulters should be printed, and sent to every member of the society, in order that the obloquy might not rest, as it now did, vaguely on the credit of the whole of the members, but might be publicly and distinctly brought home to the parties in fault. The Duke of Richmond then rose and said, "Gentlemen, the reason why the council have not proceeded to the extreme measure of publishing the names of those members whose subscription happens to remain unpaid, is this: they feel that this is yet a young society, that an imperfect registry has been obtained of the addresses of many members; that causes of many kinds, independently of a wish to withhold their subscriptions, may have occasioned non-payment; business, ill health, or their being prevented from attending their usual market-town, may each and all have in numerous instances led to the omission, and, perhaps, subsequent forgetfulness of this requisite duty to the society. The council have not, therefore, thought it right for an omission in the payment of a sovereign or two, to show up a gentleman to his friends as a defaulter, and to post a man for not paying his subscription for the first year or two. I think it will be better at first to name the circumstance to the gentleman who proposed each member, requesting his friendly mediation and individual interest, without, however, in any way regarding such proposer as responsible for the arrear, and I am certain that the greater part of these arrears will eventually be thus recovered." Mr. Childers, M P., observed, that although it was true they had 7,000*l*. in the funds, he was unwilling that gentlemen should go away with the idea that the society's finances were flourishing. Investment was not income but capital, and the society ought not to be in the case of a man who had spent his stock in the funds instead of living on the interest. Mr. Childers regretted to find so many landowners of immense property pay their sovereign as a member's subscription, instead of becoming governors, and paying their five pounds to sustain the means and usefulness of the society. "Ours," said Mr. Childers, "is the cheapest society ever formed; for one sovereign, a member not only gains all the information and advantages of the society, but he actually receives his ten or twelve shillings a-year back in Journals, and I do trust that a larger accession will ere long take place in the number of our governors, and that peers of the realm, and large landed proprietors, will not be one pound subscribers, and put back ten or twelve shillings of their subscription into their pockets. The Earl of Roseberry bore testimony, as a vice-president of the Highland and Agricultural Society of Scotland, to the interest with which the proceedings of the Agricultural Society of England were watched; and hoped that the day was not distant when, with a higher rate of subscription, the Highland Society would follow the example of England in circulating among its members the same admirable medium of communication as the Journal so well known to that meeting. Sir Charles Lemon wished to make one remark, and that a very important one, on the analysis of soils, which it was stated the Government had proposed to have made at the Museum of Economic Geology. He was perfectly certain that if this analysis of the soils of the kingdom was to extend no further than the analyses at present made at that office into the elements of the soils, such an undertaking would prove perfectly futile as to great questions of fertility and sterility of soils to be settled by such an investigation. In the analyses there made, the alkalies were entirely overlooked, and a mere rough analysis given of the common earths of soils; an omission of the greatest consequence, as had been proved in the present case, from examinations of fertilised soils resting on the Cornish rocks; and he sincerely trusted that the society would gain the consent of the Government for such an analysis to be effected as would prove satisfactory to the members and of real value to the country. The Marquis of Downshire gave a general invitation to the members to accompany him and the deputation from the meeting at Bristol to join the great meeting of the Royal Irish Agricultural Society, to be held at Cork in the following week. It would give him great satisfaction to induce as many of the members as possible to visit the shores of Ireland on that occasion.

COUNTRY SHOWS.

Birmingham Horticultural Society, May 19.—The first exhibition was held at the Town-hall, and prizes were awarded as follows: —Exotic Orchidaceæ: 1, Phalænopsis amábilis, G. Barker, Esq.; 2, Epidendrum oncidioides, W. Robins, Esq.; 3, Brássia maculata, G. Barker, Esq.; 4, Acanthophíppium bícolor, J. Willmore, Esq. Six plants, do.: 1, Epidendrum aloifólium, Leptotes bícolor, Lælia cinnabarina, Odontoglossum maculatum, Govénia sp., and Sténia pallida, G. Barker, Esq.: do., 2, Oncídium divaricatum, On. pulchellum, On. ampliatum, Brássia Henchmanni, Brássia sp., and Maxillaria Barringtóniæ, G. Barker, Esq. Stove Plants: 1, Justicia bícolor, J. Mason, Esq.; 2, Euphórbia splendens, D. Houghton, Esq.; 3, Aphelandra cristata, J. Mason, Esq.; 4, Franciscea uniflora, Messrs. J. Pope and Sons. Greenhouse Plants: 1, Chorozema Henchmanni, J. Mason, Esq.; 2, Oxylóbium Pulteneæ, J. Willmore, Esq.; 3, Pimelea decussata, J. Gough, Esq.; 4, Bossiæa linophylla, J. Willmore, Esq. Six plants, do.: 1, J. Willmore, Esq.; do., 2, J. Mason, Esq. Amaryllidaceæ: 1, Clívia nóbilis, G. Barker, Esq.; 2, Amaryllis formosíssima, J. Gough, Esq. Ericas: 1, Hartnelli, J. Y. Bedford, Esq.; 2, Sulphúrea, J. Y. Bedford, Esq.; 3, do., Beaumóntia, J. Willmore, Esq.; 4, Odorata rósea, J. Willmore, Esq. Six plants, do.: 1, John Willmore, Esq. Pelargóniums: 1, splèndidum, J. Upfill, Esq.; 2, Joan of Arc, A. Kenrick, Esq.; 3, Conservative, J. Upfill, Esq.; 4, Alexandrina, A. Kenrick, Esq. Six plants, do.: 1, J. Upfill, Esq.; ditto, 2, A. Kenrick, Esq. Cacti: 1, Seedling, A. Kenrick, Esq.; 2, C. speciosíssimus, J. Upfill, Esq.; Jenkinsoni, D. Houghton, Esq. Six Melon-shaped Cacti: 1, G. Barker, Esq. Pæonies: 1, Banksiæ, Messrs. J. Pope and Sons; 2, Banksiæ, G. Barker, Esq.; 3, Papaverácea, Mr. J. Moore. Six Alpine Plants, 1, Messrs. J. Pope and Sons; 2, Mr. J. Moore; 3, Mr. J. Moore. Six Herbaceous Plants: 1, Messrs. J. Pope and Sons. Six Cut Hyacinths: 1, G. Barker, Esq. Auriculas: 1, Oliver's Lovely Ann, Messrs. J. Pope and Sons; 2, Kenyon's Ringleader, do.; 3, Franklin's Crœsus, do. Six Polyanthuses: 1, Messrs. J. Pope and Sons; 2, do., Mr. J. Moore. Orange-tree in fruit: 1, J. F. Ledsam, Esq.; 2, do. Six Ferns: 1, Mr. J. Moore. 24 Pansies: 1, *Gardeners and Amateurs*, J. Willmore, Esq.; do., 2, J. Mason, Esq.; do., 3, Mr. W. Finnemore. Do., 1, *Nurserymen*; do., 2, Messrs. Pope and Sons; do., 3, Mr. J. Moore. Roses: 1, Smith's Noisette, J. Mason, Esq.; 2, Devoniensis, Messrs. J. Pope and Sons. Camellias: 1, Corallina, J. Willmore, Esq.; 2, Maliflora, ditto. Aza'leas: 1, Sinensis, do.; 2, Ledifólia, Messrs. J. Pope and Sons; 3, Danielsiana, J. Gough, Esq.; 4, do., D. Houghton, Esq.—Fruits and Vegetables: *Pine*, 1, Enville, J. Taylor, Esq.; 2, St. Vincent, do. *Pears*: 1, Catillac, R. L. Chance, Esq. *Apples*: 1, French Pearmain, J. F. Ledsam, Esq.; 2, Alexander, do.; 3, Pearmain, do. *Strawberries*: 1, Keen's Seedling, W. Robins, Esq.; 2, do., J. Upfill, Esq.; 3, do., H. Dawes, Esq.; 4, do. *Rhubarb*: 1, Victoria, Mr. J. Moore; 2, Giant, T. Chattock, Esq. 50 *Asparagus*. 1, W. Robins, Esq.; 2, H. Dawes, Esq.; 3, J. Gough, Esq. *Brace of Cucumbers*: 1, Improved Manchester, W. Robins, Esq.; 2, Defiance, J. F. Ledsam, Esq.; 3, Roman Emperor, A. Kenrick, Esq. *White Broccoli*: 1, J. Gough, Esq.; do., 2, H. Dawes, Esq. *Purple Broccoli*: 1, J. Gough, Esq. *Kidney Beans*: 1, A. Kenrick, Esq.; 2, T. Chattock, Esq.; 3, do. *Potatoes*: 1, Aubrey Kidney, J. Gough, Esq.; 2, Ash-leaved Kidney, R. L. Chance, Esq.; 3, do., H. Dawes, Esq. *Sea-kale*: 1, J. Gough, Esq. *Lettuce*: 1, Early Kent, T. Chattock, Esq.; 2, Golden Cos, J. Gough, Esq.—Extra Prizes: *Grapes*, D. Houghton, Esq.; *Spinach*, H. Dawes, Esq.; *Mushrooms*, R. L. Chance, Esq.; Euphórbia splendens, Messrs. J. Pope and Sons; Rosa odorata bougere, D. Houghton, Esq.; Rosa odorata, I. Mason, Esq.; Azálea ledifólia, J. Willmore, Esq.; Cactus speciosus, J. F. Ledsam, Esq.; Cactus flagelliformis, J. Gough, Esq.; Lílium exímium, W. Wills, Esq.; Clématis bícolor, P. Kenway, Esq.—Numerous prizes were also distributed amongst Cottagers, for the best Flowers and Vegetables.

Cambridgeshire Horticultural Society, May 18th.—The second Exhibition for the season was held at the Town-hall. The plants were very fine, and excited the admiration of the numerous visitors. The prizes were as follows: *Strawberries* (30 best)—Keen's Seedling, Mr. R. Headley. Tulips—*Medal*, Sansjoie, Royal Sovereign, Catalani, Lavinia, Superbe, unknown, Mr. R. Headley; 2d (classed *ad meritum*), do.; 3d, Ambassadeur d'Hollande, Polyphemus, Platoff, Rubens, Rosa Bianca, Princess Victoria, Mr. Twitchett; 4th, Platoff, Polyphemus, Rose Quarto, Triomphe Royal, Ambassadeur d'Hollande, Violet, Mr. Haylock. Anemones (6 best double), Mr. Gimson; 2d, Mr. Widnall. Pelargoniums (6 best), *Medal*—Alicia, Annette, Coronation, Effulgens, Priory Queen, Victory, Mr. Widnall; 2d, Joan d'Arc, Lowndes's Perfection, Dennis' Perfection, Alicia, Splendidissimum, Messrs. Hudson. Pelargoniums (6 best, various), offered to *Amateurs* only—same as above, Messrs. Hudson; 2d, Perfection, Joan d'Arc, Victory, Alicia, Superb, Chef-d'Œuvre, Mr. Batson. Calceolarias (6 best), Meteor, Lady of the Lake, 4 seedlings, Mr. Widnall; 2d, Mr. Biggs. Collection of Cut Pansies (24 varieties) —Widnall's Crocus, Eliza, Conservative, Jupiter, Mirror, Nestor, Venus, Shepherd's Laura, Bridges' Lady Peel, Silverlock's Prince Albert, King's Champion, and 12 beautiful seedlings of Mr. Widnall's own raising, not named, Mr. Widnall; 2d, Mr. R. Headley; 3d, Mr. Batson. *Stock*, White Queen, Mr. H. Green; 2d, Mr. Twitchett. *Plant in bloom*—Hydrángea hortensia, Mr. Green; 2d, Tropæolum tricolorum, Mr. Widnall. *Plant in bloom (to Amateurs only)*, Hoya carnosa, Messrs. Hudson. *Collection of Plants in bloom (exceeding* 40), Mr. Widnall; 2d, Mr. Green. *Collection of Plants in bloom (not exceeding* 40), Mr. Biggs; 2d, Messrs. Hudson. *Basket of Vegetables*, do.; 2d, Mr. Newman. *Asparagus* (50 heads), Mr. J. Taylor. *Basket of Salad*, do.; 2d, Messrs. Hudson. Extra Prizes: *Plant*, Epacris grandiflora, Mr. Gimson. *Cucumbers*, Mr. R. Headley. *Rhubarb* (Giant), Mr. Green. *Pæonies*, Mr. Gimson. *Cut Flowers*, Messrs. Hudson. Prizes given by Mr. R. Headley: *Collection of Cut Pansies*, Mr. Widnall; 2d, Mr. Headley; 3d, Mr. J. Taylor.

Glasgow Horticultural Society, May 18.—The spring meeting for this season took place in the Trades' Hall, and prizes were awarded as under:—Pelargoniums: 1, Mr. W. Paton, gr. to W. Gilmour, Esq., for Lady Nithsdale, Sylph, Alexandrina, and Vandyk; 2, Mr. J. Middleton, gr. to Arch. Campbell, Esq., for Joan of Arc, Alexandrina, Beauty of Ware, and Vivid. Calceolarias: 1, Mr. A. Turnbull, gr. to Lord Douglas, for Kentish Beauty, Juba, Unique, and Eva; 2, Mr. W. M'Diarmid, gr. to J. Hunter, Esq. Verbenas: 1, Mr. C. Ross, gr. to Miss Buchanan, for Tweediana grandiflora, Arraniana major, Melindres latifólia, and Hendersónia; 2, Mr. J. Borthwick, gr. to A. Bogle, Esq., for Hendersónia, Melindres, Neilli, and another. Bouquets: 1, Mr. W. M'Diarmid, for Clianthus puníceus (from the open border), Solanum crispum, Cýtisus purpúreus, Phlox procumbens, P. verna, Cardámine pratensis, Aquilégia canadensis, Ledum thymifólium, Daphne Cneorum, Azálea (several species), Clematis azúrea grandiflora, Pæónia Moutan, Anémone pulsatilla, Alyssum saxátile, Solidago sp., Rosa sinensis, Double and Single Wallflower, Double and Single Stock, Jonquils, &c.; 2, Mr. J. Tait, gr. to W. Couper, Esq., for Clianthus puníceus (from the open border, four years exposed), Lupinus polyphyllus, L. Cruikshankii, Single and Double Wallflower; Single and Double Stock, White, Red, and Purple; Aquilégia, Gentiana, Valeriana, Tróllius, Geràniums, &c., of sorts. Greenhouse Plants: 1, Mr. A. Turnbull, for Epacris pulchella, Tropæ'olum tricolorum, and Erica linnæoides; 2, Mr. R. Guthrie, gr. to Sir A. Campbell, Bart., for Azálea sinensis, Erythrina Crista-galli, Hóvea Celsi, and Fúchsia fulgens. Rhodoraceæ: Mr. R. Guthrie; 2, Mr. Wm. M'Diarmid, for Rhododendron pónticum album, Daphneoides, Conspícuum and Seedling; Azálea póntica pállida, glauca, tricolor, Ronáldsii, rubra, aúrea, virgata, fastigiata, and ignescens; Ledum thymifólium and buxifolium, Kálmia glauca and rósea. Native Plants: 1, Mr. C. Ross; 2, Mr. J. Hardie, gr. to Col. Harvey; 3, Mr. J. M'Leod, gr. to J. Ewing, Esq. Extra Plants: 1, Mr. A. Turnbull, for Oncídium flexuosum and Calanthe veratrifólia; 2, Mr. Andrew Turnbull, for Erica florida var. campanulata, E. perspícua var. rósea, E. perspícua var. alba nana; 3, Mr. Andrew Turnbull, for Clematis Sieboldi, Pentstemon Cobæa and Státice arbórea. Seedling Pansies: 1, Mr. W. Paton; 2, Mr. J. Bulloch, gr. to Mrs. Crooks. Named Pansies: 1, Mr. J. Bulloch, for Lord Douglas, Turnbull's Attraction, Talleyrand, Olympia, Juliana, Amata, Livy, Shakspeare, Gem, Thyne's rotunda superba, Howard, Sir Walter Scott, Queen, Thomson's Princess Royal, Dean Swift, Criterion, Imogen, Carlo Dolci, Hecate, Admiral, Romeo, Edina; 2, Mr. William M'Diarmid, for Queen Victoria, Widnall's Prince Albert, Lady Douglas, Juliana, Priam, Defiance, Hewit's Queen of England, Lord Douglas, Good Sir James, Thomson's Carlo Dolci, Marquis of Lorn, Lavinia, Dorcas, and Seedlings. 3, Mr. J. Borthwick, for Archduke, Widnall's Beauty and Gem, Thyne's Gem, Widnall's Ivanhoe, Widnall's Jupiter, Lepruck, Mirror, Queen Bess, Maid of the Mill, the Doctor, Rival Doctor, Masterpiece, Rienzi, Amelia, Angelina, Brown's Beauty. Apples: 1, Mr. J. Smith, gr. to the Marquis of Bute, for Paradise Pippin, Scarlet Nonpareil, Kirke's Nonpareil, and Stone Pippin. Extra Fruit: *Cherries*, Mr. J. Hardie. *Cucumbers*: 1, Mr. J. Sinclair, for Roman Emperor; 2, Mr. J. Smith. *Asparagus*: 1, Mr. J. Sinclair. *Broccoli*, Mr. G. Weston, gr. to James Dunlop, Esq. *Sea-kale*: 1, Mr. J. Borthwick. *Rhubarb*: 1, Mr. Wm. M'Diarmid. *Vegetables*: 1, Mr. W. M'Diarmid; 2, Mr. M. Munro, gr. to J. Donaldson, Esq.; 3, Mr. J. Borthwick.—Exhibited from Bothwe Castle—Manéttia glabra, Erica intermédia, Calceolaria Bothwelliana, and Turnbull's No. 6, C. 1841. Milton Lockhart:—24 Tulips. Knowehead:—24 named Pansies. Greenhead, Govan:—Broccoli. Earnock House:—Mayduke Cherries, fully ripe, from an unflued wall, the fruit of a tree planted in January 1842. Keir:—very large and beautiful Pansies. Maryland:—Seedling Pansies. Gilmourhill:—a monster Cucumber, two joined side by side. Messrs. Cowan and Co.:—Ericas, Pimeleas, Epacris of sorts; Chorizema varium; Leschénaultia formosa; Cistus formosus; Borónia denticulata; Acácia pulchella; Cýtisus formosus; Tropæ'olum pentaphyllum; Cinerárias—Grandesse, Rival King, Urania, and other sorts; Calceolária alpha; Azálea, Fuchsia, Pelargónium, Hyacinth, Ledum, &c.,; a large collection of new Pansies and Tulips. Messrs. Drysdale and Co.:—Fabiana imbricata and Ericas; Lilium longiflorum; Cinerária Wilsoni. Messrs. Austin and M'Aslan:—a large collection of Greenhouse Plants in pots; Pansies, Tulips, &c. Mr. James Thyne:—a large collection of Greenhouse Plants, in pots, and a great variety of new Heartsease or Pansies.

Tamworth Horticultural Society, May 3rd.—Prizes awarded; 1st and 2nd Greenhouse Plants, H. J. Pye, Esq. 1st and 2nd Seedling Pelargoniums, J. Brammal, Esq. The Adelaide Prize for the best Florist Flower was won by H. J. Pye, Esq., with Oliver's Lovely Ann Auricula. 12 Pansies: 1st, Mr. Lathbury; 2nd Mr. Holmes. 1st 6 do., Mr. Lathbury; 2nd, Mr. Holmes. Best 6 Hyacinths, H. J. Pye, Esq. Auriculas: *Green-edged*, 1st, Oliver's Lovely Ann, H. J. Pye, Esq.; 2nd, Captain Inge; 3rd, H. J. Pye, Esq. *Grey-edged*: 1, Mary Ann, Mr. Clarke; 2, Conqueror of Europe, Capt. Inge; 2, Grime's Privateer, H. J. Pye, Esq. *White-edged*: 1, Pillar of Beauty, Capt. Inge; 2, Taylor's Incomparable, Mr. Clarke; 3, Taylor's Glory, H. J. Pye, Esq. *Dark Selfs*: 1, Mundy's Blue Self, Capt. Inge; 2, Squire Mundy, H. J. Pye, Esq. *Blue Selfs*: 1, Bishop of Lichfield, H. Pye, Esq.; 2, Schole's Seedling, do. *Shaded Selfs*: 1, Seedling, H. J. Pye, Esq.; 2, Partridge's Village Maid, do. Polyanthuses: *Dark*: 1, Lord Lincoln, and 2, Lord Rancliff, H. J. Pye, Esq.; 3, Pearson's Alexander, Capt. Inge. *Red*: 1, Alsherley's Dragoon, H. J. Pye, Esq.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Franciscea latifolia. Broad-leaved Franciscea. (*Stove Shrub.*) Scrophulariáceæ. Didynámia Angiospermia.—This splendid plant was first introduced and flowered by Mr. Moore, of the Glasnevin Botanic Garden, and is a native of Fejuco, in Brazil. All the good properties of F. Hopeana exist in the present species. It flowers profusely throughout the winter and spring months, presenting at the same time a diversity of colours, varying from dark blue to almost pure white, and exhaling a fragrance which is agreeable to most persons. The leaves are nearly twice the size, and of a richer green than those of F. Hopeana, while the flowers are comparatively larger, some having measured two inches and three quarters in diameter. Their colour, also, is of a deeper blue when first developed, becoming after the first or second day quite colourless, or of a delicate white. The compost in which it is potted should be light, of about one-half fibrous heath-mould, the rest sandy loam, mixed with well-rotted leaf-mould and some silver-sand. It is important that the plant be not in too confined a position, nor have the soil too much shaded by other plants. If there be a bark-pit in the house, in which the pot may be plunged, and not distant from the roof, its growth will be more luxuriant, as it delights in a moist atmosphere, such as arises from a mass of fermenting material or earth. Cuttings prepared from the partially-matured shoots, root with tolerable readiness in a warm and humid pit under a hand-glass.—*Paxton's Mag. of Botany.*

Calceola'ria Standíshii. Mr. Standish's Slipperwort. (*Greenhouse Herbaceous Plant.*) Scrophulariáceæ. Diándria Monogýnia.—This handsome variety was raised by Mr. J. Standish, of Bagshot, and is a hybrid between C. incomparabilis and a spotted seedling of his own. It is sub-shrubby, and an excellent grower, which makes it a decided improvement upon C. Alstonii. The flowers are not very large; the lower lip approaches more to a circular than an oval figure, and the whole has a yellow ground, with numerous streaks and blotches of reddish-brown, having a tendency to radiate outwards from the centre of the flower.—*Paxton's Mag. of Botany.*

Mina lobata. Lobe-leaved Mina. *(Half-hardy Annual.)* Convolvulaceæ. Pentandria Monogynía.—It is not a little singular that this beautiful plant, cultivated by the Mexicans for purposes of decoration, and therefore one would imagine common, should have never reached Europe till last year, when a packet of seeds, presented to the Earl of Burlington by George Frederick Dickson, Esq., produced it in the gardens at Holker. It was afterwards given to the Horticultural Society by his Lordship, but, being an annual, it perished, having only produced two seeds, which we fear were imperfectly ripened. They have been sown, and if it is possible to get them to grow, the species may yet be preserved; and it will doubtless be easily multiplied by cuttings in the early part of the year. Take away the flowers of this curious plant, and no one would suspect it to be anything more than some common Ipomœa; but remove the leaves, and it loses all appearance of the Convolvulaceous order, so unusual is it among such plants to have racemose flowers, erect, and arranged almost in the scorpioid manner of a Borage; to say nothing of the uncommon form of the corolla, and its peculiar colour, at first rich crimson, but changing through orange to pale yellow as the blossoms unfold. Botanists unacquainted with this plant, except from La Llave's good description, have referred it to the genus Quamoclit, with which it doubtless corresponds in many respects, especially in the structure of the ovary and stigma. But in that genus, that is to say in the legitimate species, of which the old Ipomœa Quamoclit must be regarded as the type, the flowers are arranged in the manner common to the majority of the order, and the limb of the corolla is as usual flat when expanded. Here, on the contrary, we have quite a peculiar infloresence, and the limb of the corolla inflated into an oblong five-cornered bag, the base of which is so much thrust inwards by the tube as to hide that part from immediate view. Considering what the characters are on which the recognised genera of the Convolvulaceous order are established, it certainly appears to me that this genus Mina must be recognised.—*Bot. Reg.*

Otochilus fuscus. Brownish-flowered Otochilus. Orchidáceæ. Gynándria Monándria. (*Stove Epiphyte.*) A very singular, but by no means showy epiphyte; an inhabitant of the trunks of trees in Nepal, and by Dr. Wallich introduced into this country. It flowered in the Glasgow Botanic Garden in February 1841. The flowers are arranged on a raceme, and are of pale flesh-colour with a brown column.—*Bot. Mag.*

Houlle'tia Brocklehurstiana. Orchidáceæ. Gynándria Monándria. (*Stove Epiphyte*).—This was first flowered by T. Brocklehurst, Esq., of the Fence, near Macclesfield, and subsequently in the nurseries of Mr. Knight, and Messrs. Henderson. The pseudo-bulbs and leaves very much resemble those of Maxillária Warreana. The former are large, somewhat conical, and strongly furrowed; while the foliage is spreading, with deeply-depressed nerves. The flower-scape being produced at the base of the newly-formed shoots, appears at a time when there is little or no foliage. It is very stout, nearly upright, and bears six or seven handsome blossoms, which are often from three to four inches in diameter. They form a somewhat concave surface, with brownish and richly-mottled sepals and petals, and a singularly-formed, as well as a beautifully-coloured, lip. Although the species will flourish in a suspended basket, it seems to thrive best in a pot, filled with reduced sphagnum, turfy heath-soil, and pot-sherds. When it begins growing, and while it is in an excitable state, it should be freely watered, on account of its vigorous character; but very little water will be required during its period of torpidity. It is now in most nurseries, and may be propagated by taking off one or more of the pseudo-bulbs.—*Paxton's Magazine of Botany.*

Podotheca Gnaphalioides. **Cudweed Podotheca.** Compósitæ. Syngenésia Æqualis. (*Greenhouse Annual.*) This very distinct species was raised at the nursery of Messrs. J. Dickson and Sons, Edinburgh, in spring, 1841, from a collection of Swan River seeds communicated the year before by Mr. Murray, Lintrose. It flowered abundantly in July and August, but ripened no seed; it has, however, been propagated by cuttings. The flowers are bright yellow, and borne on close terminal heads.—*Bot. Mag.*

Epidéndrum cinnabarinum. **Cinnabar Epidendrum.** Orchidáceæ, § Epidéndreæ. Gynándria Monándria. (*Stove Epiphyte.*)—This beautiful plant was obtained from Pernambuco by Messrs. Loddiges, with whom it flowered in May 1840. Salzmann, a German collector, originally met with it in sandy thickets near Bahia; and it is found among Martius' plants from the same province, marked "high ground of the Serra de Sincorá, and on rocks near Villa Rica, in the province of Mines, growing from four to five feet high." It ought to be grown in the Orchidaceous house or moist stove. The pots should be well drained; this is very simply done by inverting a small pot in a larger one, which also allows the heat to rise readily to the roots. It grows well in brown turfy peat, and requires a liberal supply of water during the growing season. Its general treatment may be much the same as that of E. elongatum.—*Bot. Reg.*

MISCELLANEOUS.

AN ENGLISH COTTAGE.

Beside a lane, diverging from a wood,
Where tall tree-tops o'er-roof'd the grassy way,
A white-wash'd cot in calm seclusion stood,
And, sloping down to face the southern ray,
Before the door a well-stock'd garden lay;
Clean-weeded beds by winding walks outspread,
Where household roots were ripening day by day,
And blossom'd beans delicious perfume shed,
While fruit-trees bending low, arch'd closely overhead.

All round the place a look of comfort beam'd,
True English comfort, homely, calm, and sweet!
The very trees, amid their stillness, seem'd
With quiet joy their leafy friends to meet,
And on the roses smiled beside their feet:
The shaded lane, the soft and balmy air,
The breath of flowers new-waked the morn to greet;
All seem'd so pure, so innocent, and fair,
That in such scenes as these man never need despair.

Along the walls sweet-scented creepers hung,
Nail'd here and there, their fragile stems to stay;
And after rain the gentle breezes flung
Such floating fragrance far across the way,
As lured the bees from distant fields to stray;
A rustic porch, with straggling woodbine dress'd,
And blooming roses made the cottage gay;
While near at hand, the plum-tree's welcome guest,
Three summers, undisturbed, a thrush had built her nest.

In two small plots, with border-box hemm'd round,
Rare healing plants and choicest pot-herbs grew;
The garden-balm, 'mid village dames renown'd;
And fragrant thyme, its rich aroma threw
O'er mint and white-leaved sage, and bitter rue.
Not far from these the straw-thatch'd bee-hives stood,
Where in and out, all day, incessant flew
The labouring bees, so bent on public good
That idlers none disgraced that busy neighbourhood.

Belfast Chronicle.

Artificial Climate.—As the exertions of naturalists, botanists, and gardeners to introduce new plants from foreign countries to our own are continually on the increase, it is the duty of cultivators to study the nature of every plant more minutely, in order to place it in a similar situation to that to which it was accustomed. The hints which travellers give us should be accurately attended to, because they have acquired their experience from actual observation. The want of success with new plants in our gardens is for the most part occasioned by our ignorance of their natural soil, climate, and station; and thus success is often a mere chance, instead of the consequence of real knowledge. Twenty years ago, we should scarcely have thought that our greenhouses could have been filled with epiphytes, parasites, &c.; and although their culture is yet new in many gardens, still the progress is very perceptible. In the publication of new plants, the locality and method of cultivation should be mentioned, especially of Orchidaceæ, paying attention to how long each kind should be kept dry or moist, and the length of time it should rest before being repotted. Many gardeners have imbibed the erroneous opinion that tropical plants should be kept in constant vegetation, as if they enjoyed an eternal summer. This is a wrong notion, for there also vegetation is arrested, although but for a short time; some trees lose their foliage, and even evergreens remain in a dormant state. It is therefore necessary that we should in our hothouses allow trees and shrubs a certain period of rest, that they may prepare themselves for a new growth, especially those plants which lose their leaves every year, which, with few exceptions, neither produce blossom nor fruit if kept constantly growing in an unvarying temperature. In greenhouses, kept at all times to a certain degree, plants do not thrive so gaily, nor are they so healthy, as where a considerable range of temperature is permitted. On this account, the house should be kept warmer during the day than at night. The plants require this, both for rest and restoration. More attention should therefore be paid to it, as hothouses are generally warmed by flues, which create a dry heat, and have a disadvantageous effect on vegetable life. Although there are means of filling the air with the necessary moisture, still this is soon dried up by the heat of the flues, and cannot be always replaced. A well-constructed hot-water apparatus offers a great advantage; and plants in such houses thrive much better. Perhaps the time is not distant when this method of heating will be universally practised. By overheating the dry stove, the plants soon lose their foliage, whilst the former does not produce so deleterious an effect. The worst period for hothouses occurs in October and November, when the days are often moist and dull, with cold nights. If the gardener is not at that time very cautious in heating the houses, the plants are soon deprived of their leaves, and become sickly. In like manner, it is injurious when sun and fire-heat come in contact, which often happens in changeable weather, the sun darting out when least expected. All these disadvantages are avoided by the hot-water system. We have gained much by this method of treatment; and many things may be cultivated which otherwise would never have succeeded. By this arrangement, not only may the interior of houses be heated, but also the beds in which seedling plants are grown, and where, by careful cultivation, they can be preserved through the winter without glass.—*M. Otto, in the Garten-Zeitung.*

New Cactus.—A new seedling of most extraordinary beauty has just been sent us by Mr. Conway, Nurseryman, Old Brompton. It is a cross between *Speciosissimus* and *Ackermanni*, having the large size of the former and the rich scarlet colour of the latter, with only a tinge of violet inside. Although the plant has only now flowered for the first time and is quite small, the blossoms measured eight inches in diameter. The petals have a fine broad oblong outline, and the stigma is a bright violet. It is much the handsomest sort yet raised. It is to be called Conway's Giant, and its name is no exaggeration.

The Druse Onion.—A good many bulbs of this new vegetable have been brought from Lebanon, by Colonel Colquhoun of the Artillery, and by him given to his friends. It is a narrow bulb, rather wider at the upper end, and about five inches long. It is said to be of excellent quality, and to propagate itself by cloves like Garlic. It was obtained from the mountainous region inhabited by the Druses.

Mr. Hartweg.—Advices from this collector have been received by the Horticultural Society down to the 28th of January, at which period he was at Riobamba, at the foot of Chimborazo, distant about six leagues, with Tunguragua and Casquirazo, also snow-capped mountains, in full view. After examining these points of the Andes he was about to penetrate into Popayan. The difficulty of travelling in Guayaquil had proved serious, owing to the badness of the roads intersected in all directions by mountain streams, of which, near Loxa, he had had to cross sixty-five in one day! The roads were called good when the mud was only up to the mules' fetlocks. At Loxa he had found a large quantity of Epiphytes, quite new, and among them a new Cattleya of great beauty, some magnificent twining Oncidiums, the true Cyrtochila of Humboldt, and the famous Wax Palm, whose waxy secretion is mixed with tallow and made into candles. His collections from this neighbourhood also include several vaccinaceous plants, probably Thiebaudias, and possibly Macleania and Cavendishia, many bulbs, between 80 and 90 kinds of seed, and between 2 and 300 species of dried plants. These had been despatched from Guayaquil to Panama on the 1st of January, in sixteen chests, and are on their way home. At Cuenca he had fallen in with some beautiful species of Berberis, with small leaves and large flowers, a tall shrubby Lobelia, a gigantic Tropæolum, with pale yellow flowers and enormous seeds, ascending to the summit of the highest trees, and a large-rooted Gesnera.

Botanical News.—We are glad to announce the appointment of Mr. Gardner to the Chair of Botany in the Andersonian Institution at Glasgow. A fourth part of the Prince of Salm Dyck's Monograph of Aloes and Mesembryanthemums, and a new part of Otto and Pfeiffer's Monograph of Cartaceæ, are published. The second part of Vol. II. of Torrey and Gray's Flora of North America is on sale; it continues Compositæ as far as Achyrachæna, and is entirely systematical. Schleiden and Vogel have published an important paper on albumen, the substance of which we shall give very shortly. A posthumous memoir on Myrtaceæ, by De Candolle, has appeared in the Memoirs of the Physical Society of Geneva. M. Alphonse De Candolle has inserted in the Bibl. Univ. de Genève a Memoir on the increase of Cocoa-nut stems; the same author has completed his valuable researches on the Myrsinaceous order. We have also before us a Memoir on a Sapotaceous genus called Labourdonnaisia, by M. Bojer; some interesting observations by Fenzl, of Vienna, upon some genera, Bignoniaceous and otherwise, of doubtful affinity; and a new number of the Nova Acta (v. 19, suppl. 2), comprehending a paper on Lepidagathis, by Nees Von Esenbeck; and on Chamælaucieæ, by Schauer.

Floating Gardens of Kashmir.—An important use is made of the abundant water surface of Kashmir, in the formation of floating gardens. Various aquatic plants spring from the bottom of the lake, as Water Lilies, Confervæ, Reeds, &c. By cutting the roots of these about two feet below the surface of the water, they lose all connexion with the bottom of the lake, but retain their former connexion with respect to each other. When thus detached from the soil, they are pressed into somewhat closer contact, and formed into beds about two yards wide and of an indefinite length. The heads of the Sedges and other plants of the float are now cut off and laid upon its surface and covered with a thin coat of mud, which gradually sinks into the mass of matted roots. The bed floats, but is retained in its position by a stake driven through at each end, which admits of its rising and falling with the river. A quantity of Confervæ are torn off from the bottom of the lake and are formed into conical mounds upon the floats, about two feet in diameter at the base, and of the same height, terminating at the top in a hollow, which is filled with fresh mud, to which wood-ashes are sometimes added. The Cucumber and Melon plants, having each about four leaves, are planted three in each mound, of which a double row runs along the edge of every bed, distant about two feet from each other. No further care is requisite, except that of collecting the fruit; and a more economical plan of raising Cucumbers can scarcely be devised. I traversed a tract of about fifty acres of these floating gardens, and saw not above a dozen unhealthy plants. The general depth of the beds was about two feet, and some of them were about seven feet wide.—*Moorcroft's Travels*, vol. ii. p. 137.

GARDEN MEMORANDA.

Waterer's Exhibition of Rhododendrons and Azaleas, in the King's Road.—We last week gave some account of the magnificent display of these plants in Mr. Waterer's Nursery, at Knaphill. Let us now recommend, most strongly, our readers, who have not leisure for a longer ride, to visit the King's Road, where the choicest of Mr. Waterer's specimens are gathered together, under canvas, and are arranged in a most attractive manner. There is nothing near London so beautiful as this is just now, even although the Azaleas are nearly gone: for they are succeeded by noble bushes of Rhododendrons of all colours, and by Kalmias such as are rarely offered for sale. Protected by a canvas screen, and kept moist by frequent watering, the plants retain their freshness much more than would be the case in the open air.

Mr. Goldham, of Islington, is one of the most distinguished Tulip-growers of the present day: he has for many years been weeding his collection of such flowers as would not bear the scrutinising eye of the floral critic—so that his bed has become very select. It also contains many flowers of first-rate character, broken by himself, which from their slowness in increasing have not found their way into other collections. The season has been an unfavourable one for Tulips: and this bed bears evidence, with the others we have visited, that its bad effects have been general. Nevertheless, in every bed many flowers will be found in a state to repay a long journey. In the class of Byblœmens, Pandora was finer than we had ever seen it: the flame small and clear. Napoleon is a flower of the same character, but with a broader flame. These have both short, fine cups, which, when fully expanded, display the clear bottoms and markings to the greatest advantage. Parmegiano was very fine; and Fanny Kemble, Duchess of Sutherland, Violet Quarto, and John Kemble, sustained their high reputation. Belle Actrice, and Roi de Siam, an old favourite we wish oftener to see, were both in a fine state. Among the Roses, the Gem, attractive from its high-coloured flame, was not so good as we have seen it: but Goldham's Maria (a beautiful Rose), and his Queen (a new flower, with a peculiar flame), made up for the Gem being a little out of character. Fleur des Dames and Catalani were both remarkable. In the class of Bizarres, Goldham's Sultan and Milton—the first for its rich flame and feather, and the latter for its constant feather and delicate ground—merited notice. Shakspere, Polyphemus, Surpasse Pompe, and Apelles, with its bright ground and narrow feather, were extremely good. Another Bizarre, which we noticed last season among the offsets, we found transferred to the bed, and will in future be known as Goldham's Perfection—a title which it appears to merit, from the exquisite form of the cup, its clear bright yellow ground, and its sharp and beautifully pencilled feather. Mr. Goldham has been again successful this season in breaking several flowers, some of which are of a high character. Among the best were the following:—Rose superb, a deep-coloured rose, with a bold flame, of the same character of breaking as Holmes's King; a fine Bizarre, named Dr. Lindley, the ground of the deepest orange yellow we have seen in the Tulip, with a decided flame; both these flowers have novelty, with their other good qualities, to recommend them: a Byblœmen called Jane, possessing a fine cup, with good flame, upon a delicate white; a beautiful Rose, with the feather perfect, good cup, and clear ground; a Bizarre similar to Groom's Prince Albert in its style of breaking—the difference consisting principally in the colour of the feathering, which in this is a rosy purple; another Bizarre, with a perfect narrow feather, good cup, and clear bright yellow ground, very fine. There were several others, of various degrees of merit. A purple Rose, with a deep uniform feather in all the petals; and another with a mouse-colour mixed with the rose at the bottom of the flame. These we regarded as the élite of the newly-broken flowers. Considering the quantity of Tulips annually broken, with finely-formed cups and stainless bottoms, it is evident that this new and superior class of flowers will supersede the old varieties, whose value consists principally in their colour and regularity of marking. The aim of the present growers is to unite these qualities with cups of unexceptionable form, and with grounds in which no impurity enters. This will no doubt in a few years be attained; it has been Mr. Goldham's favourite object, and he has long pursued it with perseverance and untiring zeal.

Mr. Groom's Tulips were noticed at the commencement of the season; we visited the bed afterwards, to see in a state of perfection his Victoria Regina. This is a feathered Byblœmen, and one of the most perfect Tulips we ever saw. The cup is finely formed, the petals well rounded, even on their edges, setting close to each other, and retaining to the last their beautiful shape. The feathering is uniform, beautifully and perfectly pencilled, beginning low down on the petal, and continuing unbroken to the top. The white is clean, and the purple very rich. After a careful examination it left one wish only unsatisfied, that is, regarding its height: we wished the stem a few inches longer, that the flower might appear to court the scrutiny it can so well sustain without damage to its reputation. Mr. Groom's flowers are evidently much improved by their removal from Walworth into a purer air—in size and colour they are very superior to last season. The Anemones are blooming finely, and the Ranunculuses promise well.—*25th May.*

Reviews.

Practical Chemistry for Farmers and Landowners. By Joshua Trimmer. 8vo. Parker. 1842.

This is a good practical book on the important subject of agricultural chemistry, well written, by a person familiar with the details of husbandry and the wants of farmers, as well as with their ways of thinking. It professes to be a popular exposition of Liebig's book, in order that the principles of that writer "may be brought home to those who are ignorant of even the rudiments of the science" of chemistry. It is, however, not a servile imitation; a popular view of chemistry is given in the first instance, and it is only after leading the reader through the foundations of the subject, that, in a second part of his work, the practical application of chemical facts to the purposes of the farmer is brought forward by Mr. Trimmer. Here it is that the assertions, facts, and theories of Liebig are employed, intermingled, however, with valuable information, derived from the writings of Sprengel and others, and an explanation of the reasons why they are so important, with reference to that great end, which must be paramount to all others, the obtaining the greatest amount of produce from a given piece of land, at the smallest possible expense.

If farmers would but study such a book as this, so as to understand it, they could not fail to derive great advantage from it; but for that purpose it must really be studied; to read it only is of little use: for Mr. Trimmer does not treat the subject superficially; on the contrary, he goes into chemical explanations of everything he touches upon, as well as chemical calculations of the profit or loss upon many of the operations that engage his attention. On this account, although the book is written in a familiar manner, and in a plain unaffected style, it nevertheless *must* be read with attention to be comprehended.

We select a passage or two, almost at random. The following extract shows the way in which the author looks at the subject he has undertaken to deal with :—

"Of all the improvements which have taken place in British Agriculture during the last century, few have originated with practical farmers. They have been adopted by them, it is true, but it has been slowly and reluctantly; and when adopted they have been adhered to with the same pertinacity as the old practice which they superseded. The farmer of the present day considers his mode of cultivation perfect, and plumes himself on his four or six-course rotation, by which the soil is maintained in a state of fertility by the alternation of green with white crops. His grandfather considered this a grievous innovation, and held that no good wheat had been grown since the abandonment of the antiquated system of three crops and a fallow. His grandson, on the other hand, will wonder that in applying the animal excrements which constitute farmyard manure, he should have systematically deprived them of the greater part of their fertilising properties before he laid them on the land; that he should so utterly have neglected the most powerful manure of all—human urine; and that he should have been at the expense of carting from one extremity of a large and hilly farm to the other, many tons per acre of rotten dung, when the same results might have been obtained by means of a few hundredweights of certain cheap salts. It is the same with mechanical improvements of the implements used in agriculture. Every district has its favourite plough, handed down from father to son from the rudest times, and constructed in apparent defiance of some of the plainest principles of mechanics. Improvements in the construction of ploughs are effected, which render them capable of performing their work as well or better, and with a smaller expenditure of labour; but the workmen who have been accustomed to the old implements cannot hold the new, and the farmer does not like them. 'Your little kicketing ploughs,' he tells you, 'may do very well on the light lands of Norfolk, or even on the clays of Essex, but they will not do *here*; and as to your two horses, we find quite enough to do to plough our land properly with four.' As well might they lock the wheels of their wagons and carts, and then insist on the necessity of an increased number of horses to draw them; or take the edge off their carving knives, and contend that nothing but blunt knives, and plenty of strength, will cut meat properly. And yet the ploughs of improved construction slowly make their way, and become the established plough of the district; and men are now working their land with two horses, who, when the first implements of the kind made their appearance in their neighbourhood, twenty years ago, allowed the farmer who used them three years only before he would be dragging them along the surface of the ground. It was the same with the improved breeds of cattle. The new Leicesters, and the Short-horns, had to contend with much prejudice in every fresh district in which they came in contact with the native races, which they have superseded. They have now become such idols of butchers and graziers, that practical men give fancy prices for them, and the current of prejudice appears to be so far taking the opposite direction, that the valuable qualities of some of the unimproved breeds by which they are adapted to their native districts appear too much overlooked in the prevalent rage for producing the greatest quantity of tallow in the shortest possible time."

Mr. Trimmer's observations on Bones illustrate his usual mode of treating more scientific topics :—

"The manuring powers of ground bones are due partly to the presence of the nitrogen of their gelatine (when it has not been extracted by boiling), and partly to their phosphates of lime and magnesia. The constituents of bones, according to the analysis of Berzelius, have been already stated. Liebig estimates the amount of nitrogen contained in the 32 or 33 per cent. of gelatine at 5.28 in 100 parts of that substance, and consequently that 100 lbs. of bones are equivalent, as a nitrogenous manure, to 250 lbs. of human urine. He further estimates that 8 lbs. of bone-dust contain as much of the phosphates of lime and magnesia as 1,000 lbs. of hay or wheat straw, and that 2 lbs. contain as much of these phosphates as 1,000 lbs. of the grain of wheat. When reduced to fine powder, and moistened, bones generate heat; their gelatine is decomposed and converted into the carbonate and other salts of ammonia, which are retained in a great measure by the powder itself. He recommends, as the best mode of their application, that they should be wetted, in a state of fine powder, with half their weight of sulphuric acid diluted with three or four parts of water, and after they have been thus digested for some time, and 100 parts of water have been added, that the mixture should be sprinkled over the field before the plough. The free acids unite immediately with the alkalies existing in the soil, and form neutral compounds. Corn and kitchen-garden crops throve vigorously in a soil consisting of decomposed grauwacke (a sandstone of the slate series), when thus manured. The superior efficacy of boiled to unboiled bones he attributes to the removal of the fatty matter, by boiling, the presence of which impedes the putrefaction of the gelatine. As a substitute for bones, he recommends the employment of a similar solution of phosphates in muriatic acid, the refuse of glue manufactories, many hundred tons of which are annually thrown away. In consequence of this suggestion, this glue refuse has recently been tried as a manure for turnips, with the best success. Bones have long been used in Norfolk for turnips, drilled in with the seed, at the rate of 20 bushels per acre, but are now getting rather out of repute in some parts of that county, partly perhaps because the ground, from their repeated use, contains as much of the phosphates as the crops grown on it require—and therefore an additional dose produces no effect; and partly on account of a disease with which the sheep have been affected, and which is supposed, whether justly or not, to be confined to the land which has been much dressed with bones. Unboiled bones contain 33 per cent. of gelatine (yielding 5.28 per cent. of nitrogen), 52.20 per cent. of the phosphates of lime and magnesia, and 11.30 per cent. carbonate of lime, and in these, with the exception of a trifling proportion of soda, their manuring powers must be sought. 261 lbs. of bones contain 86.13 lbs. of gelatine (equal to 4.54 lbs. of nitrogen), and 136.24 lbs. of phosphates, and 29.50 lbs. of carbonate of lime, answering to 16.5 of lime. Hay containing 1 per cent. of nitrogen, the 4½ lbs. of nitrogen would produce 450 lbs. of hay; and 8 lbs. of bones, containing as much phosphate of lime and magnesia as 1,000 lbs. of hay, 261 lbs. of bones ought to contain as much of these phosphates as 32,625 lbs. of hay. On the whole, notwithstanding the great benefit derived from the use of bones in the above quantity, there is reason to suppose that a more economical mode of application might be devised, by using them in smaller quantities, mixed with some nitrogenous manure—sulphate of ammonia, for instance—of which 112 lbs., worth about 25s., contain 21 lbs. of nitrogen."

In conclusion, we conscientiously recommend this work as a useful addition to a Farmer's or Gardener's library. The only thing we are disposed to criticise is its having been published *without an index;* which would have much increased its value.

A Word or Two on Guano,

Is a pamphlet by Mr. Potter, giving an account of an artificial substance which he manufactures as a substitute for this celebrated manure. There can be no doubt that a chemist is able to compound the ingredients of Guano in such a way as to form a substance in no essential particular different from that which is brought from Peru; and which may have a great advantage over the foreign substance in the uniformity of its composition. Mr. Potter says :—

"After very many experiments I have formed such a mixture, which I can with the greatest confidence recommend to the notice of agriculturists, and most earnestly solicit them, not so much for the sake of any benefit I may ultimately receive, as for their own advantage, and, consequently, for that of the nation itself, (for anything affecting agriculture affects the national interests,) to make trial of it against any other manure, such as farmyard manure, bones, native guano, saltpetre, nitrate of soda, urate, rape, &c., in the manner recommended by Professor Johnston. In the *Artificial Guano, uniformity of composition* may be always depended on, so that the farmer will not be open to the disappointment and vexation arising from the use of an uncertain substance, which may produce splendid results one year, and the next be comparatively useless."

How far Mr. Potter's expectations, or those of the purchasers of this artificial manure, may be answered, can only be determined by experiment. We certainly, however, advise our agricultural friends to give it a fair trial. And this further we may say: that, if a sensible pamphlet, well written, is any guarantee of the author's acquaintance with the subject of manures, the treatise before us justifies our placing confidence in his recommendation of the Artificial Guano.

CALENDAR OF OPERATIONS *for the ensuing week.*

THE present season having been so prolific in blossom, and so favourable to the setting of the fruit, an unusually abundant crop may be generally expected; more so, in fact, than the trees can possibly mature. Those therefore who prefer a reasonable supply of good fruit to a profuse quantity of an inferior quality, should at once put in force the recommendation given in a previous Calendar, to reduce the fruit, by thinning, within the bounds of a fair and proper crop, before the vigour of the trees is diminished by their excessive load. This suggestion is chiefly applicable to espalier, wall, and dwarf trees; those only, in short, which are confined within prescribed limits by pruning and training. To thin the fruit of large orchard trees would of course be quite impracticable; but the advantage of reducing the immense burden of those that are accessible is so palpable, that it only requires to be named to induce its adoption.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—The principal part of the fruiting plants for supplying the dessert up to Christmas ought now to be showing. If no symptoms of this are discernible, the plants should be subjected to a higher temperature, and at the same time kept drier, which sudden change of treatment will most likely have the desired effect. Besides the top-dressing, or earthing, formerly advised, the swelling of the fruit would be assisted by liquid manure once a week, especially if the plants are confined to small pots. All suckers that are not wanted should be prevented from growing by twisting out their hearts by means of a pointed stick. Except to increase the stock of a particular sort, not more than two ought to be left upon each plant.

VINERY.—Vines are sometimes trained to the rafters of a Peach-house. This is not a good practice, especially when the Peach-trees are forced rather early, because at certain stages these and the Vines will require opposite treatment. For instance, if the Vines and the Peach-trees were excited at the same time, the former will be in blossom, and will consequently require to be kept warmer than usual, at the time when the latter will be about forming their stones, and will necessarily require more air than usual. This difficulty is much more easily overcome now in the late house than it would have been earlier in the season; still, considerable caution will be necessary at this time, if such a case occurs, to prevent one or other of the crops from being sacrificed.

PEACH-HOUSE.—Expose the trees freely whenever practicable. Fruit that is swelling off should be kept warmer, and the house closed earlier in the afternoon, than those which are later. As soon as the fruit in the first house is all gathered, wash the trees well with an engine, and water the borders if necessary.

CHERRY-HOUSE.—Ripening fruit should have all the air possible; the sashes may be kept partly open all night in fine weather. Take care that the trees are quite clean previously to the ripening of the cherries.

FIG-HOUSE.—A dry and free atmosphere is essential when the fruit is ripe. The trees must not be syringed, nor any more water given at the root than is required to keep them in health, till the first crop is all gathered.

CUCUMBERS AND MELONS.—It will be advisable to keep up a moderate degree of heat in the beds, by means of linings; otherwise the plants will be severely checked in case of the occurrence of a few sunless days and cold nights. Cut off all deformed fruit, leaving one only at each joint; if very fine fruit is desired, it must be left proportionally thin, and put, when quite young, into boxes or glasses made for the purpose.

KIDNEY BEANS.—If any of those directed to be sown in pots in the end of April have been kept under glass, they will now be in blossom. Give them room and plenty of water, and they will continue to bear till the first-transplanted crop supplies the table.

Out-door Department.

ASPARAGUS.—As Peas are now coming into use, Asparagus ought not to be cut so close as it has been; all the weaker shoots should be allowed to grow after this time, and only an occasional dish cut of the strongest. Bear in mind that the more it is cut this season, the less there will be to cut next.

BEANS.—Another crop should be put in. Top the plants from previous sowings when they are in full bloom, and before the fruit is set.

BROCCOLI.—Water that transplanted, if the weather be at all dry.

CAULIFLOWERS.—The autumn-sown plants will now be heading, and in droughty weather will require copious waterings; also water those recently transplanted, together with Cabbages and all other Greens.

CARDOONS.—Thin the first sown, leaving single plants a yard apart.

CHERVIL, CURLED MALLOWS (for garnishing), BORAGE, and any annual herbs of which a succession is required, should now be sown.

LEEKS.—Transplant a part of those first sown. To obtain large plants, they should be grown in rich soil, or in shallow manured trenches, like Celery. If the latter mode is adopted, they can be earthed up as they grow, to blanch the stems.

LETTUCE.—Keep up a plentiful stock of plants of different ages by frequent sowings and plantings, for in dry weather many will run.

ONIONS.—Take advantage of showery weather to thin the spring-sown beds; the thinnings may be planted if required.

PEAS.—The sticking of these is often deferred too long, when they fall on one side by their own weight, and cannot be set into a proper position without bruising and injuring the stems; this should be guarded against by giving them support in proper time.

TOMATOES.—If not yet done, plant these against a wall or paling. Capsicums, Basil, Tobacco, and all other tender annual herbs should now be put out.

ORCHARD.—Clean the Strawberry plantations thoroughly before the fruit begins to ripen. The bare ground between the rows should be covered with short grass from the mowing of the lawn, which will keep the ground cool in dry, and the fruit clean in wet, weather. In gathering green Gooseberries for bottling, choose sizeable ones, leaving the largest berries to ripen for dessert. Wall-trees must be frequently washed by the garden-engine; for if insects become numerous, they will not be got under without much trouble, as well as injury to the trees. Soap-suds are a powerful check to the Cherry aphis, but tobacco-water is the most effectual liquid remedy. Trees that are badly infested should be pruned previously to washing, by which a number of insects will be got rid of.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Artificial heat may now be dispensed with; give air freely during the day, and shut up early in the afternoon in order to get the house warm for the evening. If the directions formerly given respecting the thinning of plants have been attended to, the only thing to be done now is to train them carefully into the desired form. Do not shade the plants too much, or they will grow weakly. Orchidaceous plants, however, require more shade than others.

GREENHOUSE AND CONSERVATORY.—The canvas screen formerly suggested will be found extremely serviceable in prolonging the freshness of the flowers, and also in saving considerable labour in watering, which is an important object in dry weather, when both time and water may be profitably employed in other quarters. Camellias that have made their wood and formed their blossom-buds should be removed to a cool situation, where they will not be exposed to bright sunshine, by which their tender leaves would be discoloured. Those that are wanted to flower before Christmas had better be kept a little longer under glass, to forward their buds. Some cultivators prefer the stage of growth above alluded to for repotting their plants, alleging that the pots then get well filled with roots before winter, which is not the case when the plants are potted in autumn.

PITS AND FRAMES.—Young plants, whether from seeds or cuttings, will be better in one of these structures than exposed to all sorts of weather out of doors. By tilting the sashes at the back and front, the plants will have the benefit of the free air, and can readily be shaded from the burning sun in very hot days. In potting off seedling greenhouse or stove plants, use small pots and very sandy soil at first, by which they will be encouraged to root freely.

Out-door Department.

Continue to tie up perennial flowers as necessary, and pay attention to the proper thinning of annuals which have been sown in the flower-borders; these are generally allowed to stand much too thick. In dry weather a sufficient supply of moisture must be given to all flowers that have lately been planted out, especially to those turned out of pots, the balls of which are liable to get dry, while the soil around them is comparatively damp and moist.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Wild Rose-trees which have been planted for stocks to bud upon should be examined, and all the side shoots rubbed off, excepting three or four at the proper height to form a head. Take care to remove the clay and ligatures from vigorous-growing grafts in time, that the part united to the stock may have room to swell.

FOREST AND COPPICE WOODS.—The same process of cleaning recommended last week to be adopted with young trees should also be followed with hedges, and especially with young ones, which are too often seen quite choked with weeds.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending June 2, 1842, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT GARDEN MARKET,

For the week ending June 3, 1842.

The late fine weather has considerably increased the supply of almost all kinds of Fruits and Vegetables; and trade has been brisker than for many preceding weeks. *Fruit.*—Pines are plentiful, and their price is rather abated, being from 6*s.* to 12*s.* per lb. Grapes are abundant, of good quality, at the same rate as in our last report. Some White Muscats have appeared during the week, at 10*s.* per lb. Melons are fetching from 3*s.* to 10*s.* each. Peaches and Nectarines are becoming more abundant, at a somewhat reduced price, being from 12*s.* to 30*s.* per doz. Cherries are ranging between 4*s.* and 15*s.* per lb. Strawberries continue much the same as they were last week. There are abundance of Gooseberries and Currants; which are considerably cheaper than in our last account. Apples are not quite so plentiful; we observed some good samples of the Gooseberry Pippin, and French Crab; the former from 7*s.* to 9*s.* per bushel, the latter from 5*s.* to 7*s.* per bushel. Cucumbers are abundant, and are much cheaper than they have yet been. *Vegetables.*—Asparagus still maintains its high price, and is by no means plentiful; the best is fetching from 4*s.* to 6*s.* per bunch. Cauliflowers are improved in quality, and are somewhat cheaper, from 2*s.* to 8*s.* per doz. Peas have become daily more plentiful; they are selling at 30*s.* per barge, and from 10*s.* to 12*s.* per bushel. Cabbages are exceedingly abundant, and of good quality, from 6*d.* to 1*s.* 6*d.* per doz. New Potatoes are much cheaper, being from 4*d.* to 1*s.* per lb.; the Cornish kinds from 1*s.* 6*d.* to 3*s.* per dozen lbs. Young Turnips and Carrots are plentiful; the former from 3*s.* to 8*s.* per doz. bunches, the latter from 6*d.* to 1*s.* 3*d.* per bunch. Rhubarb is abundant, from 4*s.* to 12*s.* per doz. bundles. Mushrooms are rather scarce, and are selling from 9*d.* to 1*s.* 6*d.* per pottle.

PRICES Saturday, June 4, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* 6*d* to 6*s*
— Dessert, per bushel, 5*s* to 12*s*
Strawberries, forced, per oz., 4*d* to 1*s*
Peaches, per doz. 12*s* to 30*s*
Nectarines, per doz., 12*s* to 30*s*
Pine Apple, per lb. 6*s* to 12*s*
Grapes, per pound, 4*s* to 8*s*
— Muscats, per pound, 10*s*
Oranges, per doz., 1*s* to 2*s* 6*d*
— per 100, 7*s* to 16*s*
— Bitter, per 100, 10*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*

Cucumbers, per brace, 8*d* to 3*s*
Melons, English, each, 3*s* to 10*s*
Cherries, per lb. 4*s* to 15*s*
Gooseberries, per hf. sve., 3*s* to 3*s* 6*d*
Currants, per half sieve, 4*s* to 5*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Walnuts, per bushel, 16*s* to 24*s*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, White, per doz. 6*d* to 1*s* 6*d*
Cabbage Plants, per doz., 4*s* to 5*s*
Broccoli, Brown, p. bnch., 1*s* 6*d*
Cauliflowers, per doz., 2*s* to 8*s*
Peas, per barge, 18*s* to 24*s*
— per sieve, 8*s* to 12*s*
— per half sieve, 5*s* to 7*s*
— per sack, 21*s* to 26*s*
Kidney Beans, forced, p. 100, 2*s* 6*d* to 3*s* 6*d*
Potatoes, per ton, 45*s* to 90*s*
— per cwt. 2*s* 6*d* to 5*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* 6*d* to 3*s*
Turnips, White, per doz. bun., 3*s* to 2*s*
Carrots, young, per bunch, 6*d* to 1*s* 3*d*
Parsneps, per dozen, 9*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* to 8*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Spinach, per sieve, 1*s*
Chives, per pot, 3*d*
Leeks, per dozen bunches, 9*d* to 1*s* 6*d*
Artichokes, per doz. 5*s* to 10*s*

Garlic, per lb. 1*s*
Shallots, per doz. bchs., 3*s* to 4*s*
— Green, per bunch, 3*d*
Onions, per half sieve, 5*s* 6*d*
— Green, per bch., 2*d* to 3*d*
Asparagus, per 100, large, 4*s* to 6*s*
— Second or Middling, 2*s* to 3*s*
— Sprue, or Small, 1*s* to 1*s* 6*d*
Lettuce, Cabbage, p. score, 6*d* to 1*s*
— Cos, 6*d* to 1*s* 3*d*
Celery, per bundle (12 to 15) 6*d*
— young, per bundle, 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch. 4*d* to 6*d*
Parsley, per half sieve, 1*s*
Tarragon, per dozen bunches, 3*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 2*s*
Mint, per dozen bunches, 2*s* to 3*s*
Marjoram, per doz. bunches, 2*s*
Savory, per doz. bunch., 2*s*
Basil, per doz. bunches, 2*s*
Rhubarb Stalks, doz. bundles, 4*s* to 12*s*
Mushrooms, per pottle, 9*d* to 1*s* 6*d*

Notices to Correspondents.

Will any of our correspondents give us information as to the most improved mode of constructing lime-kilns?

A Correspondent is willing to give 2*s.* 6*d.* for a copy of No. 9; to be forwarded to this Office.

D. R.—Do you think the Asparagus is to fill your bottle by magic? In a fortnight or three weeks you may judge of the result, but not sooner. The Asparagus will branch and fill the inside of the bottle; and the only question is whether it will do so fast enough to be tender? We shall see. As the bottles used are of *no* value, we don't see how the system can be called expensive. Those who do not grow Pines and Peaches can exhibit at the Society's meetings, as you will see, by looking to the printed regulations. There is nothing to show that the pulse mentioned in Daniel, chap. i. ver. 12, was any particular kind: it may have been Peas, it may have been Lentils, or both, or anything else of that sort.

J. L.—It is stated by Bosc that the peculiar flavour of Schabziguer Cheese is produced by a small quantity of Chives, Parsley, and Tarragon, chopped very fine. But this corresponds neither with the taste of this sort of cheese, nor with common report. It is believed that the flowers of the Blue Melilot are employed for the purpose of giving this cheese its flavour: we are assured in the French "Dictionary of Natural Sciences," that they are an ingredient in some Swiss cheeses; and in another of these dictionaries (Dict. Class. d'Hist. Nat.) it is distinctly asserted that the Swiss peasants employ it to aromatise that variety of cheese to which they give the name of "Chapsigre." With respect to the name of the cheese, Bosc also states that it is made at Schabziguer, in the canton of Glarus; but we find no mention of such a district as Schabziguer in this Canton. He is, however, right in saying that the cheese is made in Glarus; and it probably takes its name from the *Zieger-klee*, or *Zieger-kraut*, which is the German name of the Blue Melilot. According to Campe's Wörterbuch, *Zieger* is the name given to a particular sort of curd, or cheese made from it. The latter is also called *Zieger-kaese.*

D. Z.—We regard the mode of packing seeds recommended by you as by no means a good one. If you will turn to p. 715 of last year you will see why.

Potentilla.—Your plant is Arthropódium paniculatum. We do not think favourably of either the Calceolaria or Verbena; but perhaps that is owing to their having been so very unskilfully packed. If one way is more effectual than another in destroying flowers, it is that vile system of using cotton wool, which dries up all the juices of a flower, and renders it as dead as itself. Camphor is a good reviver, and so are other things, if a plant is alive; but when dead, such substances have no more power of resuscitation than the Queen's Coroner. You remember the old complaint:—

> The Crowner's quest was held on the body;
> But 'twould not bring him to life again.

J. B.—If Rhubarb seed is not wanted, it is a mere waste of the powers of a plant to allow it to flower. For the same reason, Asparagus should not be permitted to bear berries, nor Sea-kale flowers and seeds. We shall answer your inquiry about Dung in a short time. Look to our leading articles.

Esto Perpetua has too formidable a name for us to undertake the perpetual labour of naming his plants. As we have often stated on former occasions, we are not unwilling to take this upon ourselves to a moderate extent: but we cannot satisfy the curiosity of those who gather some scores of bits of greenhouse plants, huddle them together into a letter, some with, some without marks, and then despatch them to us. Time is too valuable to be thus wasted. Such plants as those of "Esto Perpetua" are such as a gardener ought to be acquainted with himself.

X. Y. Z.—There is no botanical reason why the Kidney-Bean turns or grows round the trainers in one direction, and the Hop, on the contrary; thus reversing the order of the spiral?—It is their nature to do so, and can be no more explained than why man walks on two legs and monkeys on four.

Flora.—The disease with which your Pelargóniums are affected, appears to be very prevalent this season. It is difficult to assign a cause for it, unless we were acquainted with the previous treatment of the plants. If you have been syringing them late in the evening and have neglected to close your house afterwards during some of the cold nights which have occurred of late, that would be sufficient to produce it. In the specimens sent there is not the least trace of an insect.

Erin-go-Bragh. — Your plants are,—1, Erica Boweiana; 5, Kennédya nígricans; 6, Verónica Beccabunga; 7, Erióphorum polystáchion; 8, Carex stricta. The rest are such wretched specimens that it is impossible to determine what they are.

C. F. C.—Ivy, if nailed to it, may be expected after a time to adhere to your whitewashed wall. We know of no other means, as it appears to have an antipathy to lime. Fruit-trees will succeed quite as well against a stone wall as against a brick one, although the former is neither so neat in appearance nor can the trees be trained in such a regular form upon it as upon the latter. The last disadvantage may be, in a great measure, remedied by having a wooden or wire trellis affixed to it.

Pleias.—Your plant is Dielytra formosa. The Bokhara Clover is nearly the same as the White or Siberian Melilot, recommended by M. Thouin to the Agricultural Society of Paris in 1788.

Carnation.—It is rather too soon at present to remove the unnecessary wood from Pear-trees; as too early a removal of it is very apt to cause the next year's buds to push. The safest time to commence doing it is when the shoots become firm and brown at their base; and instead of cutting all of them back within an inch or two of the old branch, as is generally practised, it is much better to leave a few of the strongest with six or eight leaves upon them.

H. T. S.—The best Aquatics for the deeper parts of your pond are Nymphæa alba and lútea, Calla æthiópica, and Agapanthus umbellatus. For the more shallow places, Villársia nymphæoides, Nuphar mínima, Hottónia palustris, and Caltha palustris, will be suitable. They will not be injurious to fish, and may be purchased at most nurseries. Tobacco-smoke will not injure Vines unless they are in bloom, or when the fruit is ripening; at the latter period it is liable to give the Grapes a smoky flavour. You can do nothing better with your Russéllia júncea which is attacked by the scale, than to scrub the parts infested with a stiff brush, which will probably crush them. The method of heating by hot water, inserted in the *Gardeners' Chronicle* of last week, is no doubt a good one; it is impossible for the heat of the water to crack the gutters in which it flows.

A. W.—If your Hydrangeas are all in the open border, and you wish to grow some of them in pots, you had better take up a plant, and after separating it, pot off singly some of the strongest shoots, with as many roots attached to them as you can procure. Let the soil in which they are potted be rich, and give them abundance of water, taking care to repot them whenever they require. Those which are left in the border will flower better if the weakest shoots are removed.

A Young Cottager.—The seeds of Fúchsia corymbiflora will vegetate quickly if the pots in which they are sown are plunged in a gentle hotbed. Any light soil will do for the purpose, and the pots should be well drained.

X. Y. Z.—We do not see what advantage can be derived from mixing Gypsum with the soil in which you intend to pot Auriculas and Pelargóniums.

H. S.—There is no occasion to cut off the flower-stalks of the Wistá'ria (Gly'cine) sinensis when the bloom is fallen. As the plant never perfects its seeds in this country, the bare stalks can be productive of no injury to it.

J. C. L.—No. 1 seems one of the mule Hippeastra near Johnsonii; No. 2 is H. aúlicum.

An Original Subscriber.—Pyrus pinnatifida.

A Lady Gardener will find the following Mesembryanthemums well suited to turning out in beds during the summer, provided such beds be hot and dry, viz.—Compressum, acinaciforme, rubrocinctum, lácerum, blandum, bicolorum, barbatum, pomeridianum, trícolor, papillosum.

Messrs. Donald and Son.—Flowers of a perishable nature should never be sent on a Saturday—they remain at a coach-office during Sunday—the day following they are probably too far gone to allow of a correct opinion being formed of their merits. When your box reached us the petals of your Pansies were all curled up, so that it was impossible to judge of the form of the flower, and the colour in the centres of three of them appears to have run. The eye in most of them wants boldness. Nos. 1 and 4 seem to be the best. The Passion-flower is of no particular merit.

Horace.—Your seedling Pelargonium will make a showy variety for the greenhouse. The rules by which this family are now judged are strict and precise, and your flower is deficient in the first important point, which is form; the under petals being too long, and rather too thin, they soon become loose, and prevent the flower retaining the form with which it opens. The delicate pink colour of the flower is very beautiful, the spot on the upper petals (which are of a good form) is well defined. It is superior to many of the Pelargoniums we are in the habit of seeing.

P. G.—No satisfactory opinion can be given upon the merits of your seedling Pelargoniums from the state in which the flowers were sent; we, however, like the appearance of them. No. 1 is a desirable colour; 2 bears a close resemblance to the Witch; and 3 is a fine colour with short well-formed under petals. When flowers are pressed flat, no opinion can be formed beyond their colour, and the shape of the petals; whether they reflex or retain their cupped form it is impossible to judge; you must contrive to send them in a box, without being pressed; this is the usual mode of forwarding blossoms.

H. B., Essex.—The following is our opinion of your Pansies. 5. Delicate lemon-coloured centre, good eye, all the petals are surrounded with brilliant mottled bluish purple: this is your best flower; it is of a good form, but we fear it will never lie flat, from the upper petals being so much puckered. 1. Bad form. 6. Common, and wants substance. 2. A large flower, the lower petals are in good proportion, but the symmetry is destroyed by the length of the upper petals; the eye is poor, and the edges of the petals rather rough. 4. Purple upper petals, under ones white; the eye is poor, edges of the petals rough, and the flower wants substance. 7. Upper petals purple, which is carried round the lower petals in a broad band; centre lemon colour, deeper yellow in the lower petal, with good eye. 3. Rich purple upper petals, with a broad band of the same round the lower; white centre, eye very poor. None are first-rate flowers; generally the upper petals are too high, and too much of them seen, from the side petals being too small. Nos. 5 and 7 are the best.

Discipulus's larvæ are evidently the maggots of the Crane-fly, figured and described in the *Gardeners' Chronicle*, vol. 1, p. 612. We feel exceedingly obliged to our correspondent for the experiments he has made upon them. They may well be called by gardeners Leather-jackets, when they can resist such applications as salt and lime-water; we think, however, by repeating the doses, that the larvæ would be eventually destroyed, and where places, free from valuable plants, are infected by them, such as the edges of borders and gravel walks, we would recommend watering with salt-water. Strewing the surface also with unslaked powdered lime, must be very beneficial when the maggots come above ground to feed and rove about at night, which would consequently be the best time for hand-picking. As they are particularly fond of the roots of Grass, nothing can be more dangerous than to have Grass edgings *and plots* where Dahlias and choice flowers are cultivated.—*R.*

Mr. J. F. Baillie's grubs infesting the Onions, are a species of Millipede, called Julus (Polydesmus) complanatus, *Linn.*, some account of which, with a figure, will be found at p. 196, vol. 1, of the *Gardeners' Chronicle.* We are unable to suggest any means of extirpating these troublesome animals: rotten stumps, and bark, and decaying wood-work and paling harbour them, and should therefore be removed from gardens where they multiply.—*R.*

Highgate.—The reason why the show was not noticed is, that we have not been supplied with any report of it.

Geo. Rogers.—The Fuchsia does not appear, from the specimen sent, to be sufficiently distinct from others to be worth particular notice.

R. C. K.—If the Fir is not the common Spruce, it must be a variety of it, concerning which we cannot well judge from a specimen. Sweet's "Greenhouse Cultivator" will probably provide you with the information you seek for. Loudon's "Suburban Gardener" is also a useful work.

Peto may select the following climbing Roses to cover the wall described as 200 feet long and 6 high, planting them about 10 feet apart: Blairii, Ruga, Garland Noisette, Noisette Lamasque, Wells's Noisette, Perpetua Lindleyii, Celestial China, Aimée Vibert, Invincible Carmine, Sinensis Major, Seven Sisters, White Banksian, Yellow Banksian, Boursault, De Lisle, Champneyana, Marie Leonida, Cramoisie Supérieure, Noisette Jaune Desprez, Common China. In order to cover the wall as soon as possible, Peto might plant some of the dwarf kinds between those above mentioned. The common dark China, Indica Reevesiana, the white sweet-scented China, and even some of the finer garden Roses, would answer this purpose.

J. Fish.—You will find an account of the preparation of Ink for writing upon Zinc Labels at p. 189 of this year's *Chronicle.*

A Constant Subscriber's plants are—1, Bromus mollis; 2, Bromus racemosus; 3, Carex stellulata; 4, Mílium effusum; 5, Arrhenátherum avenáceum; 6, Poa pratensis; 7, Bromus erectus; 8, Listera ovata; 9, Orchis macra: 10, A'ceras anthropóphora. It is as essential to see the leaves as well as the flowers of plants, to enable us to tell what they are.

Ignorus.—1, Téllima grandiflora; 2, Heuchera americana; 3, Verónica Loudoni.

Charles.—Your plants are in bad order; the following only can be recognised:—1, Molínia cærúlea; 2, Bromus asper; 3, Alopecurus pratensis; 4, Anthoxanthum odoratum; 8, Triglochin palustre; 9, Gerànium molle; 10, Trifólium procumbens; 11, Gymnadénia fragrans.

G. O. F.—The seed you find in the Pansy before the flower opens is not fertilised. You should take it just when on the point of expanding; *remove* the stamens very carefully, and apply the pollen of some other flower to its stigma.

G. Tyler.—Send your Seedlings to 3, Charles-street, Covent-garden; but only their blooms. Any day in the early part of the week. If you want them to be exhibited at Chiswick, they must be at 21 Regent-street, in the course of Friday next.

The note of Botanicus is sent to Kew.

Mr. Major.—The old name of your insect is Curculio vatator; its modern name you will see next week. Pray give us the information you speak of.

Would *Dr. Arnold* favour us with a leaf of his Saxifrage? The flowers alone are not sufficient to enable us to determine its species.

M. W. K., A Subscriber, Surrey, Omikron, next week.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

There can hardly be one of our readers, in the remotest district of the United Kingdom, who is not already aware of the painful circumstance which forms the leading feature in the events of the past week; and there is not one, we are assured, who does not regard it with feelings of abhorrence and indignation. It is impossible to contemplate without deep concern the fact that a second attempt has been made on the life of her Majesty—on one who, by her age, her sex, and the peculiar circumstances of her position, has given less reason than any Sovereign who ever occupied the throne, for imagining the existence of a personal motive to the commission of so grave a crime. Bound to all classes of her people by ties of the liveliest interest—the mother of a Prince to whom, at some future and, we hope, most distant day, the destinies of this great kingdom will be confided—her Majesty might have been considered more than ordinarily secure from the hand of the assassin; and we would therefore hope and believe that the unnatural attempt was the act of a lunatic, unconnected with private or political motives. From the details of this melancholy outrage which will be found in another part of our Paper, it will be seen that her Majesty was aware of the danger which awaited her; but, with that calm and courageous judgment for which her family have been remarkable, she not only preferred risking a temporary danger to the uncertainty of a constant system of precautions, but generously determined that no other female life should be exposed to the peril which she was ready to incur. These expressive facts will have their influence beyond the sphere which they more immediately concern; and while our readers will unite in one universal feeling of thankfulness to Divine Providence for the merciful preservation of Her Majesty's life, they will also, we are persuaded, cordially concur in the sentiments so happily expressed by Lord John Russell in the House of Commons, "that when her Majesty goes abroad among the people, there is not one among her subjects who has less reason than herself to fear an enemy in any single individual of the millions who constitute her subjects."

Our Foreign Intelligence is of considerable interest. By extraordinary express from Marseilles, in anticipation of the Indian mail, which reached that port on Wednesday night, we regret to say that accounts have been received of the fall of Ghuznee, which capitulated and surrendered on condition that the garrison be safely conducted to Cabul. As a compensation for this disaster, it is announced that Col. Pollock had forced the Khyber

Pass, and was expected to march forthwith to the relief of Jellalabad. Gen. Sale had overthrown the insurgents in another successful sortie, and still maintained his position: it was reported that Akhbar Khan was badly wounded, and that Shah Soojah had been poisoned. The arrival of the mail will no doubt supply us with more detailed particulars of these events; but it is understood that there is no news from China.—In France the Ministry has sustained another serious defeat. The Chamber of Deputies, in spite of the representations of the Cabinet and of the Budget Committee, has passed by a large majority an amendment on the navy estimates, appropriating a sum of three millions of francs beyond the amount demanded by Ministers, for the express purpose of increasing the navy, and keeping it on a war footing. The opposition journals express great satisfaction at this decision, which they regard as a demonstration of hostility against this country, and as likely to lead to the resignation of the Cabinet; but there seem to be no reasons for anticipating this result.—In Spain some sensation has been created by the resignation of the Ministers of Finance and Marine, in consequence of a vote of the Cortes expressing want of confidence in the Administration. The intentions of the Cabinet in regard to its future arrangements have not been made known, but it is feared that this vote may render the dissolution of the present Ministry inevitable. The accounts from Barcelona inform us that the city continues in an excited state, and serious disturbances throughout Catalonia are considered probable.—From Portugal we learn that fresh difficulties have arisen to impede the progress of the treaties with England: objections have been raised by the Council of State after all the preliminaries had been agreed to; and another reference must consequently be made to the British Government. This delay is supposed to be the result of intrigue; and it is feared that the Duke of Palmella will throw up his commission, and thereby render the question still more complicated.—The disputes between the Neapolitan Government and Holland have assumed a threatening aspect, and official notice has been issued by the King of Naples, informing the foreign merchants that a recourse to hostilities may be apprehended, and directing them to take the necessary precautions for the security of their property. —By recent arrivals from the United States we learn that Lord Ashburton is making favourable progress in the objects of his mission; and negotiations have been commenced with the States of Massachusetts and Maine for the settlement of the Boundary question.

Home News.

THE COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue at Buckingham Palace. The Queen received on Wednesday at Buckingham Palace addresses from the two Houses of Parliament, congratulating her Majesty on her escape from the recent attempt against her life, the particulars of which are given in another part of our Paper. On Saturday and Tuesday the Queen honoured the Italian Opera with her presence; and on Wednesday her Majesty held a levee at St. James's Palace, which was very numerously attended. On Thursday her Majesty, accompanied by Prince Albert and Count Mensdorf, visited Westminster Abbey. The Queen has appointed the Duchess of Norfolk and the Viscountess Canning to be Ladies of the Bedchamber in Ordinary to her Majesty, in the room of the Dowager Lady Lyttelton and the Countess of Dalhousie, resigned. The Queen held a Council yesterday, at which the Archbishop of Canterbury was ordered to prepare a form of thanksgiving for her Majesty's providential deliverance from the late treasonable attempt.

Gazette Announcements.—At the levee held by the Queen at St. James's Palace on Wednesday, her Majesty conferred the honour of Knighthood on Mr. Henry Bishop, the musical composer; on Mr. George Hayter, the historical painter; on Mr. W. C. Ross, A.R.A. miniature painter to her Majesty; and on Mr. Allan, President of the Royal Academy of Scotland.

Parliamentary Movements.—Mr. R. Bateson has been returned for the county of Derry without opposition. The Lyme Regis election committee have decided that William Penney, Esq., was not duly elected for that borough, and that Thomas Hussey, Esq., was duly elected, and should have been returned. The following resolutions were also adopted unanimously—"That the committee think it right to inform the House, that although the general charge of bribery alleged in the petition had been gone into, yet it appeared from the evidence given in the course of the scrutiny, that a corrupt practice had prevailed in the borough of Lyme Regis of lending money on notes of hand, bills of sale, and other securities, to a considerable portion of a constituency which at the last election did not exceed 280. That in the opinion of the committee this system was corrupt and demoralising, and was calculated to interfere with the honest exercise of the franchise, and especially in a small constituency. That this practice had had this effect in the borough of Lyme Regis, and ought to receive serious attention and inquiry.—The candidates who have announced themselves for the borough of Ipswich are the Earl of Desart and Thomas Gladstone, Esq., on the Conservative interest, and Mr. Thomas Gisborne, formerly member for North Derbyshire, and Mr. Moffatt, merchant of London, on the Liberal interest.—The Belfast election committee have come to the following resolutions—That J. E. Tennent, Esq., and W. G. Johnson, Esq., were not duly elected at the last election for that borough, and ought not to have been returned; and that the last election for the borough of Belfast was a void election.

Attempt to assassinate the Queen.—On Monday evening the Metropolis was thrown into a state of painful excitement by the announcement that another attempt had been made on the life of her Majesty. The subject has, during the week, been the exclusive topic of conversation among all classes, and has excited one general feeling of indignation and abhorrence. The following are the particulars of this painful occurrence:—It appears that about six o'clock the Queen was returning from her accustomed airing in the Park, in an open barouche, with Prince Albert, and while proceeding down Constitution Hill, and when within a short distance from the spot at which the former attempt on her Majesty's life was made by Edward Oxford, a young man, who had been noticed for some time previously standing near the wall skirting the gardens of the palace, advanced towards the road, and approaching to within three yards of her Majesty's carriage, presented a pistol, and discharged it at the Queen, but, fortunately, without inflicting any injury either on her Majesty or the Prince. The assassin, who on failing in his attempt hastily thrust the pistol into his bosom, was instantly seized by a soldier and other persons who happened to be near the spot, and conveyed to the palace, whither her Majesty's carriage proceeded at a rapid pace, without stopping. The prisoner was then searched, and in his pockets were found a bullet and some powder, as well as the pistol, still warm from its recent discharge, He was then conveyed to the nearest police-station, and a Cabinet Council was summoned for his examination. Information was sent to the principal Ministers, who were at the time in their places in Parliament. In the Lords, as soon as the intelligence was known, there was an immediate suspension of business, and the house at once adjourned. In the Commons, the greatest interest and sympathy were created, and after a few words of explanation from Sir R. Peel, the house instantly adjourned. Notice was immediately given to the leading members of the Privy Council, and an investigation at the Home Office took place forthwith. After a short examination, conducted with great secresy, the prisoner was remanded till the following day, and in the mean time conveyed for security to Tothill-fields Prison. As soon as the Privy Council adjourned, the members proceeded to the Palace, to congratulate the Queen on her escape. The various members of the Royal Family had already repaired thither, on the first announcement of the occurrence, together with the Foreign Ambassadors and the nobility, who manifested great anxiety in their inquiries after her Majesty. The Queen preserved throughout great presence of mind, and is said to have manifested not the least trepidation or alarm. On learning that a large concourse of persons had assembled outside the Palace, anxious to be informed that her Majesty was safe, the Queen expressed some anxiety to present herself to them, and thus assure them of her having escaped uninjured, and was only prevented from taking this step by the advice of her attendants. In the mean time, the intelligence of the attempt had spread with rapidity throughout the Metropolis, everywhere creating the greatest excitement. A notice of the occurrence was at once forwarded by the Home Secretary to the Lord Mayor, and posted at the Mansion House. The news was also communicated to the lessees of the various theatres in the course of the evening, where the announcement by the different managers caused great sensation, and called forth enthusiastic demonstrations of loyalty. On Tuesday the prisoner was again brought up for examination at the Home Office. Most of the Cabinet Ministers attended, but what transpired in the Council Chamber has not been made public, the inquiry having been strictly private. The result of the examination was, that the prisoner was committed to Newgate to take his trial on the charge of high treason. The following particulars, however, connected with the individual who has been guilty of this atrocious attempt have transpired, and may be considered authentic. His name is John Francis, and he is about 25 years of age. He is by trade a journeyman carpenter, and has been living for some time in the neighbourhood of Titchfield-street, Marylebone. He appears to have been of idle habits, and had quarelled with his father, a machine-maker at Covent-Garden Theatre, about twelve months ago, and has had no communication with him since that time. The landlord with whom he lodged represents him as having been an inoffensive young man, who came home regularly to his meals, and was never out late at night: that one person, of rather a superior class of society, from his dress and general appearance, had latterly been in the habit of visiting him, and had remained for some time with him in his room; but no parcels were ever sent to him, as also appears from particular inquiry made on the subject by the police. Indeed, from all that has transpired, there seems to be no reason for supposing that he had any accomplices in his design. It appears that he had for some days previously been seen lurking about Hyde Park: and, though the fact was not made known at the time, it has since transpired that a similar attempt was made on the Queen's life on Sunday, as her Majesty was returning from the Chapel Royal. It appears that on Sunday evening, a Mr. Dewsbury waited upon Sir P. Laurie, with two young men of the name of Pearson, printers, who stated that about 2 o'clock of that day, as her Majesty was riding through the Mall in the park, they saw a man draw a pistol and aim at the Queen, and overheard him express a wish that he had shot her Majesty. Sir Peter immediately sent the parties with a note to the Hon. C. A. Murray, master of the household, who referred them to Sir J. Graham, by whom the matter was investigated, and active inquiries were making during the whole of Monday into the affair. It is also stated, that a letter containing threatening matter was thrown at the same time into her Majesty's carriage. It appears that her Majesty had been made acquainted with these particulars before taking her accustomed airing on Monday; but with extraordinary firmness and courage she expressed her determination, as announced in the House of Peers by Lord Portman, and by Sir R. Peel in the House of Commons, "that she would not be confined as a prisoner in her own palace;" while, at the same time, she took the generous precaution of not permitting her usual attendant, Lady Portman, to accompany her, declaring that "no other female life should be exposed to danger but her own." This noble trait in the disposition of her Majesty elicited the warmest expressions of admiration and sympathy in both Houses of Parliament. On Tuesday evening, immediately after the assembling of both Houses, addresses were voted to the Queen, expressive of their abhorrence of the treasonable attempt against her person, and their heartfelt congratulations to her Majesty and the country on her happy preservation from the danger to which she was exposed. The addresses were presented to her Majesty by a deputation very numerously attended from both Houses on Wednesday. The excitement created in the Metropolis by the first announcement of the event had not subsided on the following day; and as early as 8 o'clock on Tuesday morning, numbers of persons began to assemble in front of the entrance of Buckingham Palace; and the carriages of the nobility and gentry continued to arrive throughout the day in great numbers, for the purpose of inquiring after her Majesty. In the afternoon the crowds in the neighbourhood of the Palace increased, in the expectation that the Queen, notwithstanding the daring attempt on her life the previous day, would again make her appearance, and take her accustomed airing in the Park. A little before 5, her Majesty, accompanied by Prince Albert and the Duke of Saxe-Meiningen, left the Palace in an open barouche, and drove into the Park. The first appearance of the royal carriage was the signal for loud and continued cheering, accompanied by waving of handkerchiefs and of hats. The entire road along Constitution Hill to Piccadilly was thronged with spectators; and at the triumphal arch, opposite Apsley House, as well as at the gates leading into Hyde Park, the crowd was immense. The area in front of the statue in Hyde Park was occupied by a great number of equestrians, anxiously waiting her Majesty's arrival, and the drive throughout was rendered almost impassable from the great number of the equipages of the nobility. On her Majesty entering Hyde Park, the cheering from the gentlemen, and the waving of handkerchiefs by the ladies, were general, and not a head was covered during the passage of the Queen down the ride. It was some time before the excitement caused by her Majesty's appearance had subsided, and the same manifestations of regard were shown on the Queen's return to the Palace. Both her Majesty and the Prince acknowledged these cordial greetings by repeatedly bowing. In the evening of the same day her Majesty honoured the Italian Opera with her presence, where her appearance was again the signal for one general burst of applause, and the most enthusiastic demonstrations of attachment and loyalty. Little more of importance has transpired on this subject in addition to what is given above. There seems to have been no difficulty in identifying the criminal, as, by a curious accident, it happened that more than one individual who were acquainted with his person were in the Park at the time of his apprehension, and recognised him while being conveyed away by the police. As stated above, he had been for some time separated from his family, and was in straitened circumstances, having failed in a recent attempt to set up a tobacconist's shop; and for the last few days he had been quite out of work. The evidence that the pistol was actually discharged is said to be distinct; and one police-constable deposes to having seen him take a deliberate aim. A woman has deposed, that just before the attempt she heard the prisoner say to another man, in appearance a labourer, who happened to be near him, "The Queen! why should she be such an expense to the nation? It is to support her in such grand style that us poor persons have to work so hard." The criminal sessions at the Old Bailey will commence next week, but it is thought that the prisoner's trial will be deferred till the sessions in July.

Foreign.

FRANCE.—*The Chambers.*—The proceedings in the Chambers since our last possess considerable interest, and constitute the principal portion of the intelligence in the Paris journals. There has been another animated debate on the subject of the Right of Search, the chief feature in which was the speech of Marshal Sebastiani, who explained the part he had taken in the negotiations while under the Ministry of Count Molé, and defended the treaty of 1831, signed by him when Minister. He applauded that of 1833, and declared that he was not disposed to desert the treaty of 1841, because he fully approved of it. He said he signed the protocol of 1838, because, although he had visited Paris twice between 1836 and 1838, Count Molé, then Minister, had never spoken to him on the subject. He considered himself, therefore, justified, in order to preserve the English alliance, in putting his signature to the protocol opening the negotiations. After some further discussion on this long-debated question, the Chamber proceeded to the consideration of the different chapters of the Budget. On Saturday, the department of the Navy came under discussion, when an attack was made by the Opposition on Ministers, for reducing the navy. The seizure of some English fishing boats for fishing within the prescribed limits before Granville introduced the debate, and afforded to the Opposition the ground for some severe remarks on the Government for having liberated these boats and their crews after merely seizing the oysters they contained. This question having been disposed of, the Chamber proceeded to the consideration of the article granting 23,356,900 francs for the pay and clothing of the crews of the navy. On this M. Lacrosse proposed an amendment, augmenting the grant by 1,240,800 francs, being a sum sufficient to keep 3,300 sailors more, and thus enable the Admiralty to keep twelve sail of the line, ready to be sent to sea in a short time, instead of having them merely in port-commission, with a small complement of men. Ministers proposed to have only eight sail of the line at sea and eight port-commissioned, or laid up. M. Lacrosse, on the contrary, preferred to keep up the fleet on a war footing, and spoke at great length in support of his proposition; among other reasons alluding to the right of search question. Admiral Lalande spoke in favour of M. Lacrosse's amendment. He contended that, after the efforts that had been made to increase the efficiency of the navy, the task ought not to be commenced over again; but they should preserve their effective as high as possible, to be ready for events. M. Lacave Laplagne, Minister of Finance, applauded the sentiments of Admiral Lalande, but said he must oppose M. Lacrosse's amendment, which would have the effect of increasing the expenditure three millions of francs, double the amount stated by M. Lacrosse. Financial considerations ought to operate in the rejection of this amendment, and he called upon the Chamber not to disarrange the economies proposed in the budget, which had been calculated to meet a grave and difficult deficit. A long and animated debate ensued, and finally the proposition of M. Lacrosse, notwithstanding the opposition of the Ministry and of the Budget Committee, was carried by a considerable majority. This decision of the Chamber is generally regarded as a serious check to Ministers; but though there have been rumours of some modification of the Cabinet in consequence, there appears to be no real ground for anticipating such a result. The Royalist, Liberal, and Republican prints, all express high satisfaction at this vote of the Chamber, by which they assert that all pretext for ratifying the treaty of 1841 has been removed; while they maintain that a Ministry which has been so degraded as to be compelled to have larger sums of money than it asks for to maintain the honour of the country and the dignity and independence of her flag, is called on at once to resign. The Chamber of Deputies on the motion of M. Lherbette, during the debate on the Budget of the Ministry of War, notwithstanding the opposition of Marshal Soult, suppressed an item of a grant of 60,000f. demanded for the purchase of stallions to be placed in the breeding depôts, in order to supply the deficiency of horses for the cavalry. On Monday, the Chamber voted the Budget of Expenditure. The debate on the railroad Bill has commenced in the Chamber of Peers, but it presents as yet no feature of interest.

The Fortifications.—During the debate in the Chamber of Deputies on Saturday, the fortifications of Paris caused some discussion. M. Lherbette proposed an amendment that they should not be mounted with artillery, except in case of invasion, or a war on the frontiers; and that the forts, with the exception of those of Mont Valérien, St. Denis, Rosny, Nogent, Charenton, should not be closed at the gorge, except with a palisade. M. Odillon Barrot supported the resolution. Marshal Soult assured M. Barrot that the resolution was unnecessary, as the Government could not arm the fortifications without applying to the Chamber for funds to procure cannon, of which it would require 1,800 pieces to arm them with half the necessary complement of guns. After a good deal of discussion, the amendment was finally negatived without a division.

The Capital.—Considerable excitement was created in Paris on Sunday by a report that another attempt had been made to assassinate the king; and that three emissaries of secret societies had been discovered and arrested in the neighbourhood of the Château de Bizy, where the King was residing. Several arrests in Paris were also said to have been made. The rumour was first circulated on the Bourse, where it gained considerable credit for a time; but it proved entirely without foundation. It appears to have originated from the circumstance that the dead body of a man was discovered on the road of La Roche Guyon, near Vernon, who was reported to have been the author of the attempt. It was, however, afterwards ascertained that his death was the result of suicide, the pistol with which he perpetrated the act having been found in his hand; and he has been recognised to be a wine-seller at Bercy, who committed suicide in consequence of the embarrassed state of his affairs. His Majesty, who is quite well, has returned from the Castle of Bizy to Neuilly, where he was greeted on his arrival with every demonstration of loyalty.

Algeria.—Accounts received from Algiers, dated the 20th ult., announce the arrival at that place of 84 prisoners who had been unconditionally restored to liberty by Abd-el-Kader. A convoy left Algiers for Blidah on the 20th. The same advices give an account of the destruction, by the garrison of Bougie, of a crenelated house on the borders of the Soumata, in which the Kabyles were accustomed to lie in ambush, from time to time, to shoot the reapers and mowers in the plain. The French met with some resistance in the attempt, but they had only one man killed and two slightly wounded. It is also stated that the troops about to march from Algiers would not go further than Milianah, where Gen. Bugeaud would then have with him 6,000 men. Gen. Changarnier was expected to bring him 8,000, so that there would then be an effective force of 14,000 men. With these, it is said, Gen. Bugeaud would proceed to lay waste the country in all directions, and would march as far as Hamsa. On the supply for the Government at Algiers being moved in the Chamber of Deputies on Friday, M. Manuel called the attention of Government to some executions which had taken place in the province of Constantine, without even the form of a trial. Marshal Soult said that he had some difficulty in replying to these inquiries, as he must admit that several unjustifiable executions had taken place in the province of Constantine, but he feared the moral effect which an ill-timed discussion might produce on the population in Algeria. The Marshal added, that Gen. Negrier, who ordered those executions, had acted with good faith, and as he had rendered such important services to the country during his administration, he could not resolve on recommending the King to remove him from his command. On the same occasion, a debate arose respecting the port of Algiers, when Admiral Lalande and M. Arago severely blamed the Ministry for having adopted the plan of M. Poirel. The Chamber, however, approved the Minister of War's project, sanctioned as it had been by the Council of Admiralty.—Subsequent advices have been received to the 25th ult. On the 23d an expedition marched from that city for the purpose of effecting a junction with the Governor-General at Milianah. The latter was still at Mostaganem. He had just returned from making a razzia in the territory of the Beni Amers with 428 prisoners, of whom 400 were females, the men having taken to flight.

SPAIN.—We have received from Madrid the important intelligence that a change has taken place in the Cabinet; that M. Surra y Rull, Minister of Finance, has tendered his resignation to the Regent, who has accepted it; and that M. Camba, Minister of Marine, has followed his example. These resignations have been the result of a motion passed by Congress, after a sitting of thirteen hours, on the 29th ult., and carried by a majority of 85 to 78. This resolution was as follows:—"The Congress declares that in the position in which the ministry has placed itself, it wants, notwithstanding its good intentions, the influence and moral force necessary to ensure the well-being of the country. There remains for it no alternative save retirement or the dissolution of the Cortes." M. Valle has been named Minister of Finance *ad interim*, and the duties of the War Minister have been transferred *ad interim* to the Minister of Marine. The proceedings in the Cortes have not been of great interest. On the 21st ult. M. Torrento called on the President of the Council to give the Chamber some account of the situation of the island of Cuba, and proceeded to state that the unsettled condition of that colony was to be ascribed to British diplomacy, which was labouring to effect the emancipation of the blacks, in order to wrest that valuable island from Spain. "The British consul, Mr. Turnbull," added M. Torrento, "has been superseded in his post; nevertheless, he has continued to reside in the island, as the protector of the negroes, whom he excites to revolt against their masters. He has sent emissaries in every direction to preach insurrection, and thus keeps the colonists in constant alarm." The President of the Council said that the Spanish Government, after obtaining the recall of Mr. Turnbull, having ascertained that he had not left the island, but remained there as the protector of the blacks, had notified to the English Cabinet that Spain could not recognise him in that capacity, and that if he did not retire voluntarily, he should be removed by force. The Minister, however, expressed a conviction that there would be no occasion to resort to this extremity, and added, that the authorities of Cuba possessed ample means of protecting the rights of the colonists. It may be here mentioned that intelligence has been received in London from Manzanilla de Cuba, from which we learn that a report had obtained there of a conflict between the soldiery and the black peasantry, in which 50 of the latter had been killed. It was stated that a number of runaway negroes had established themselves among a range of hills, about 15 or 20 miles from St. Jago de Cuba, where they formed a settlement somewhat similar to that established among the back woods of Trelawny, near Dromilly, some years ago. After the conclusion of the debate on the subject of this island, the Cortes proceeded to discuss the supplies, and voted the first item of those demanded for the Judiciary Department. The Senate adopted, on the 21st ult., the 160,000,000 Loan Bill, by a majority of 78 against 2. On the 23d ult., the Chamber of Deputies commenced the discussion on the Army bill, in which the permanent military force of the kingdom was fixed at 90,000 men, with a corps of reserve of 40,000. Some amendments were proposed, but the bill was ultimately carried by a majority of 80 to 33.—We learn from Barcelona letters of the 22d ult., that Gen. Barndell, governor of that town, had expired suddenly. The Carlist Guerilla Felip continued to scour the Sierras, and the Regent's troops were unsuccessful in their pursuits of him to the mountains. In addition to the bands in the Salsona range, some had appeared in the vicinity of Manresa. Great agitation prevailed in Barcelona on account of the apprehensions entertained that the modification of the cotton duties might soon be consented to by the Cortes. The Barcelona Political Chief had imposed a fine of 4,000 reals on all villages which had not placed in the public square the stone of the constitution. Private letters from Madrid mention with apprehension the excited state of Barcelona, and seem to anticipate some outbreak in that quarter; and it is said that the general tenor of the advices from Catalonia lead to the conclusion that some serious movement will shortly take place in that part of the country. Letters from Seville state that the cultivation of the coffee-plant, which has been recently attempted in Andalusia, promises to answer the most sanguine expectation.—Subsequent accounts from Madrid to the 24th ult., alluding to the change in the Cabinet, state that the withdrawal of Señor Surra y Rull from the Ministry had been agreed to for some days previously; that M. Gonzales, however, apprehending that this change might lead to a total subversion of the Cabinet, had requested him to retain the Financial Department some time longer. It is stated that the postponement of the modification of the Ministry displeased the Parliamentary coalition, who consequently resolved on making renewed efforts to overturn the Administration altogether. It is generally supposed that M. Olozaga, to whom public rumour ascribes the fall of the Cabinet, will be the individual chosen by the Regent to form a new Administration. The death of M. Sessioncede, a young poet and politician of great promise, seems to have occupied a good deal of attention among all classes in the capital. His funeral took place on the 24th ult., and was attended by most of the members of the Cortes, and a numerous assemblage of all classes.

PORTUGAL.—We have advices from Lisbon to the 23d ult. Some difficulties have again sprung up to delay the ratification of the English treaties, which were supposed, as stated in our last, to have been finally agreed to. The Duke of Palmella was said to be ready to sign them, but difficulties had been raised in the Council of State against each of them, and another reference to Lord Aberdeen, it was thought, would be the result. Fears seem to be entertained that this delay is the result of some intrigue, and that the Duke of Palmella will be induced in consequence to throw up his commissions in this case, as it is stated his Excellency has resolved to do in the matter of the negotiations with the Pope's nuncio. The difficulties raised against the commercial treaty are said to refer to the Maneio tax, which the Duke of Palmella had consented to be levied by a mixed commission; and in the case of the slave-trade treaty, the promulgation of a decree by the Government, declaring slave-trade piracy, was believed to be the ground of opposition in the Council of State. In both cases it appears the Duke of Palmella had met the views of the British Government, but his concessions had been overruled in the Council of State. A petition had been presented from Oporto, signed by 30 firms of cloth-dealers, in favour of the treaty with England, and complaining of the present high duties as only promoting the introduction of Spanish woollens into Portugal, into which they are now smuggled to a large extent. The Prince Frederick of Hesse had arrived at Lisbon with a Danish frigate and corvette, and was about to proceed with the King and Queen on a visit to Curtha and Mafra, and after spending a few days in Lisbon, would proceed to the coast of Italy. Lord Howard gave a dinner-party to the Minister, the Duke of Palmella, and several other statesmen, on the 19th ult., in honour of her Majesty's birthday. The Prussian Minister, Count Raczynski, had an audience of the Queen on the 18th ult., to deliver his credentials.

GERMANY.—Accounts from Berlin of the 25th ult., state that the French Minister, M. Pageot, had a conference on the subject of the marriage of the Queen of Spain, with the Prussian Minister for Foreign Affairs, on the 17th inst. But the result had not been made public. It is, however, stated that he has entirely failed in the object of his mission. We are also informed that the King of Prussia has conferred the Order of the Black Eagle upon the Duke of Sussex. The Assembly of the States of Baden was opened on the 23d ult., by the Minister of the Interior, in the name of the Grand Duke. In the opening speech the minister announced that the States would be called on to deliberate on a bill for prolonging the railroad to the Swiss frontiers. The budget would afterwards be laid before them, the other bills being reserved for the next ordinary Diet.

HAMBURGH.—Our advices from this city, which are to the 30th ult., bring no intelligence of importance to the general reader; being chiefly confined to commercial affairs and the effects of the late calamity upon the financial credit of the community. The accounts are on the whole satisfactory; confidence is gradually returning and trade begins to revive. The principal source of uneasiness appears to be the state of the local fire insurance companies, the parties interested in their stability being very numerous, and doubts are entertained of their capability to meet all the demands on them; as the amount of property for which they are responsible is very considerable. It does not seem, however, that any failures have yet been announced. The surveying of that part of the city which now lies in ruin, is in progress, and the commission selected to prepare plans for rebuilding it in a more convenient and handsome manner are, at present, diligently pursuing their work. Should the suggested improvements be carried into effect, it seems that the limits of the town must be enlarged; the suburb of St. George will be included within the district of the city, and the basin of water formed by the Alster, a prominent ornament of the city, will have a promenade, bordered by trees, leading round its four sides. A good deal of additional ground will be procured for the purpose of carrying these improvements into effect. Subscriptions are still arriving from all parts of the continent. At Berlin on the 24th ult., 12,590 dollars had been collected. At Augsburgh, before any public subscriptions were opened, a certain number of merchants subscribed 10,640 marks banco; and at St. Petersburgh, independent of the present made by the Emperor, a subscription had been set on foot by the Duke of Leuchtenberg, among the Imperial family, which amounted to 140,000 silver rubles.

Holland.—Accounts received from the Hague, dated the 26th ult., state that a serious thunder storm passed over the Luwoorden and the environs on the 24th; and that three or four farm-houses were struck by lightning and totally consumed. On the 25th ult., a trial was made on the iron railway from Haarlem to Hillegam; there being only the steam engine and its tender, in which were the directors. The two bridges on the line were found to answer well, and it is expected that this portion of the railway will soon be opened to the public.

Belgium.—Advices from Brussels of the 26th ult., inform us that on the 22d, 23d, and 24th ult., there were violent storms of hail and torrents of rain in different places. At Veneche and the neighbourhood the hailstones which are said to have been as large as walnuts, fell in such quantities, that on the following day they lay in several places to the depth of more than a foot; and at Malines great damage was done to the hothouses and greenhouses of the botanic gardens of many private houses.

Russia.—We learn by advices received from Constantinople that it was reported in that capital that the Emperor has despatched an envoy to Circassia; but whether to propose terms of peace, or to convey a fresh defiance, was not known. It was, however, supposed, that as Gen. Tchernecheff, Minister of War, has been appointed, with a re-inforcement of 20,000 men, Commander-in-Chief of the army in Circassia, that a renewal of hostilities may be expected.

Italy.—Intelligence has been received from Naples, bringing the official announcement that, in consequence of the difficulties which have arisen between the kingdom of the Two Sicilies and those of Belgium and Holland having assumed a serious character, the Neapolitan Government considers it necessary to apprise all merchants and shipowners that they may take such precautions as prudence shall suggest. The Minister for Foreign Affairs has apprised all ambassadors and foreign ministers of this fact, in order that they may have no cause of complaint through ignorance of any consequences to the commercial interests of those nations which they represent. It is stated that the betrothal of the second sister of the King of Naples to the Emperor of Brazil has taken place. The railway from Naples to Rome has at length obtained the approval of the Holy See. It is said that an arrangement has been made between the two states, according to which Naples will undertake the work and the expense, and Rome repay its share in annuities. A railway from Rome to Florence is also spoken of as resolved on.—Private letters, dated Rome, 20th ult., state that the admiration of a German Baroness having been excited by the magnificent altars of the isolated church of Santa Croce, formed of some of the finest marble taken from the temples of ancient Rome, she could not resist the desire of appropriating some of those ornaments for herself, and she detached several marble tablets from the altars with an iron hook. On her third attempt she was taken in the fact. A search having been made at the Baroness's residence, other objects which she had purloined were discovered. The penalty for sacrilege is that of the gallies.—Private letters, said to have been received from Romagna, and published in the French papers, state that disturbances have taken place at Ravenna, first in the churches, and next at the theatre, and that several arrests have been made.

Malta.—We have received intelligence from this island to the 19th ult., on which day the Howe 120, and the Thunderer 80, returned to that harbour from Tripoli. The fleet, under the command of Admiral Sir C. W. Owen, was ready for sea, with four months' provisions on board, but its destination was not known. More detailed accounts have been received from Tripoli of the misunderstanding between the Pacha, Askar Ali, and the British consul. It is said that steamers arrive there continually from this island with despatches for the British consul, which are immediately answered; and that this has excited the anger of his Highness. The British Government is said to have in view two important objects—the abolition of the traffic in slaves, and the removal of the Pacha. It seems that an appeal, printed in Arabic, was recently posted up at the British consulate, inviting, in the name of her Majesty's Government, all those now engaged in the slave trade to abandon the traffic, as revolting to justice and humanity; and concluding by stating that such are not only the personal feelings and desire of her Majesty and her Ministers, but of the entire nation; and that, on a future day, her Majesty might have occasion to show her good intentions towards the people of Tripoli. This document, by express directions of the Pacha, was torn down, and a variety of insults are related as having been offered by him to the consul. It also appears that several British subjects have signed a declaration, which so excited the feeling of the Pacha towards the nation, that they consider their lives in jeopardy; this document was despatched to the Admiral on the 3d ult. Abdel Gellil, the Arab chief, encouraged by a recent visit of the British consul, is said to have not only defied, but threatened to attack the Pacha; and it is even asserted that the Arabs are marching in a strong force against Misurata; that the garrison have already had a skirmish with the people of the desert; and that the latter were victorious, and were close upon Tripoli. These rumours, added to a report of the approach of a British naval force, appears to have intimidated the Pacha, who, however, refused to render satisfaction to the British consul for the acts of insolence offered to him and others under his protection. It is stated that Abdel Gellil has promised to liberate 4,000 slaves, and pass rigorous laws for the abolition of slavery, immediately his tribes are freed from the yoke they are now under, by the removal of Askar Ali, and by the nomination of an Arab chief to the government of Tripoli, under the obligation of recognising the Sultan's supreme sovereignty by a heavy annual tribute. Some interest has been created in Valletta, by the publication in the papers of a correspondence respecting the preaching of the Jesuits, between the Canonico Annetto Casolani, son of Sir Vincent Casolani, and Lord Clifford. The Canon Casolani is said to have so far compromised himself with the Government, that he has been obliged to leave the island for the Levant; and the whole affair has excited general interest both among the Maltese and English residents.

Greece.—We have accounts from Athens to the 10th ult., but they are not of great importance. The hotels of that capital are said to be so full of English travellers that some were compelled to go on by the last Austrian steamer. Among the latest arrivals is Lady Davy, widow of the late Sir Humphrey Davy. Accounts had been received from Patras, stating that the proprietors of the currant plantations there, and in other parts of the Morea, had become greatly alarmed on account of the appearance of large quantities of locusts, which had already nearly destroyed the wheat crops, and would, it was feared, prove equally fatal to the currant vines. The local government had caused nearly the entire population to go out into the vineyards and adjacent country, in the hope of exterminating these insects, and thus averting the impending evil, which it appears has been increasing since the year 1838.

Turkey.—We have received, by way of Vienna, private letters from Constantinople dated the 11th ult., four days later than the advices by the last Levant mail. We learn from them that Sami Pacha, the diplomatic agent of the Pacha of Egypt at the Porte, had succeeded in his mission to induce the Ottoman Government to take of Mehemet Ali six or seven ships of the line, now lying in the harbour of Alexandria; and as the price for this act of submission, the amount of the tribute was to be reduced. It is thought that the Pacha will gain by this arrangement, as the vessels are said to be scarcely seaworthy, and were useless to him. The Porte has sent a circular to the different legations in Constantinople, informing them that the Dardanelles and Bosphorus will in future be closed to merchant steam-vessels after sunset. Sir S. Canning had, however, requested that an exception might be made in favour of vessels arriving under stress of weather, and seeking shelter within the entrance of the straits; and had received the Reis Effendi's assurance that the Porte would comply with his suggestion.

Egypt.—Accounts received from Alexandria of the 6th ult. inform us that Mehemet Ali returned to his palace at Ras-et-Tin on that day, after an absence of seven months and a half. The batteries and fleet announced the event by a general firing of guns. His Highness has been occupied with canals and embankments, and intends to make others, as well as to proceed with the Burrage, or great dam on the Nile, in order to retain more water in the country. The Nile is at present very low, and boats have much difficulty in passing up to Cairo.

India.—The "Times" of yesterday published the following extraordinary express, which will be read with general interest: "The Indian mail, which arrived at Marseilles on Wednesday night, brings, we lament to say, an account of the fall of Ghuznee. The place capitulated and surrendered, on condition that the garrison be safely conducted to Cabul. On the other hand, Col. Pollock had forced the Khyber pass, and taken possession of the forts commanding it; and would, no doubt, march to the relief of Jellalabad. Gen. Sale, in a sortie from that place, overthrew the insurgents. A rumour prevailed that Akhbar Khan had been badly wounded. Gen. Knott had gained some advantage on the side of Kandahar, but Gen. England had not yet joined him. It is reported that Shah Soojah had been poisoned. There is no news from China."

United States.—By the arrival at Liverpool on Monday of the steamer Columbia, we have received New York papers to the 14th ult. The proceedings in Congress relate exclusively to domestic matters, and possess little interest for the foreign reader. Lord Ashburton's mission appears to be progressing in a satisfactory manner. Mr. Daniel Webster, Secretary of State, had addressed letters to the Governors of Massachusetts and Maine, alluding to the heavy expenses which had already attended the Boundary question, and recommending that each State should appoint a commissioner to confer with the General Government on "a line, or conventional line, by agreement with its terms, conditions," &c. To this letter the Governor of Massachusetts had answered, that the Executive of that commonwealth was already, by resolutions of the Legislature, authorised to do whatever might be necessary in the premises; and the Governor of Maine had issued a proclamation, convening the Legislature of that State on the 18th ult. Meanwhile Mr. Webster himself had proceeded towards the scene of the deliberations, to assist the authorities, it was supposed, by his advice in so important a business as the settlement of a national dispute of so long standing; and had arrived at New York, on his way to Massachusetts and Maine. Accounts differ as to the amount Lord Ashburton is said to have offered to pay for the disputed territory. One rumour mentioned the sum of 2,000,000 dollars, while others state it at only one million, which is considered the more probable. The Secretary of State has addressed a letter to the House of Representatives, with a bill to provide a revenue from duties on imports. The matter of the right of search has called forth a letter from Mr. Cushing, a member of the Legislature, which has been published in some of the New York papers, in which he urges that the interference of France is called for in the matter. The State of Michigan has repudiated a portion of her bonds, by official proclamation of the Governor. The pretext for this act is, that the State had not received value for its bonds, in consequence of the misconduct and fraud of the State agents. The revolution in Rhode Island, which has caused considerable excitement throughout the union, was drawing to a close. Several of the revolutionists had been arrested on charges of high treason, and others had withdrawn from the contest with the legal authorities of the State. The Governor had, meanwhile, invoked the aid of the General Government, and President Tyler, after denouncing the revolutionists as "insurgents," had promised to "stand ready to succour the authority of the State in its efforts to maintain a due respect for the laws." Several detachments of United States troops had been sent to garrison the island. According to the latest accounts, Lord Morpeth was at Ashland, Kentucky, on a visit to Mr. Clay; and Mr. C. Dickens, 'Boz,' was in the neighbourhood of Niagara and Toronto.

The West Indies.—By the arrival of the Royal Mail steamer Solway, we have received advices from Jamaica to the 15th, Trinidad to the 16th, Demerara to the 12th, and Barbadoes to the 17th April. The intelligence thus brought is not of great importance. It is stated that the crops in Jamaica, Trinidad, and Barbadoes have lately improved, in consequence of the favourable state of the weather, and that the labouring population shows more disposition to work. A fire broke out on the night of the 10th April, in the steam-bread establishment of Messrs. Atkinson and Hozier, at Kingston, the whole of which was reduced to ashes. The value of the premises is stated at 50,000*l.*, and the fire is attributed to an incendiary. Sir Charles Metcalfe had not yet left Jamaica, but preparations were making for his departure, and subscriptions for a testimonial to commemorate his exertions in behalf of the inhabitants generally had been opened. The affairs of the colonists in Demerara continued depressed, and the dispute between the planters and their servants was not yet arranged. There appears to be great and general dissatisfaction in consequence of the irregularity with which the Royal Mail Company's steamers arrived at the different ports on the coasts, and the uncertainty which marked their general movements.

Texas and Mexico.—We have received advices from Vera Cruz, brought by the Solway steamer, to the 21st April. We learn from them that the proclamation of the Texian Government, declaring the Mexican ports on that coast in a state of blockade, had not caused much sensation there, as it was supposed that the European Powers, and England in particular, would not respect such a measure, coming from a government the latter had not yet fully recognised. The new tariff was to be published in the course of a week, and was to be put in force six months after that time. The elections of the new Congress had proved unfavourable to the party of President Santa Anna; and from the strong military force the latter had created about him, it was feared that he would oppose the meeting of the Chambers, and thus give rise to new struggles between the two parties contending for power. Santa Anna had, at the requisition of the United States Government, liberated several of the subjects of that republic, who were taken prisoners in the Santa Fé expedition. Among the passengers arrived by the Solway is Gen. Bustamente, the ex-President of Mexico. Accounts have been received from Galveston to the 3d ult. The alarm created by the inroads of the brigands had passed away, and all was again quiet in Texas.

New South Wales.—We have advices from Sydney, of the 1st Feb. The papers thus brought contain copies of despatches from Sir G. Gipps, of the 31st Jan., 1841, and of Lord J. Russell's answer, on the subject of the bounties on immigration to that colony. The noble lord expresses himself strongly against the improvidence of Sir G. Gipps, and tells him that the government could not take the responsibility of his proceedings. Sir G. Gipps states in his letter of the 31st Jan., that the total number of persons for whom permission had been granted, and remaining outstanding on the 31st Dec., 1840, and for the payment of whom government is pledged, provided they arrived within two years, was 71,315, and the estimated amount of bounties payable on them 979,562*l.* He adds that the consideration, that no greater number could by possibility be brought to the colony than it was desirable for the colony to have, or than the colony would be able to pay for, had led him to grant without reserve, until very recently, permission to import emigrants to any parties of respectability asking for it. He then adds that no embarrassment could have attended this system, had it not been for the changes which he understood Lord J. Russell intended to introduce, whereby it would be left to the discretion of the importers to land them either at Sydney or at Port Philip; and that if the general land fund of the colony should be divided into three portions, the portion applicable to the payment of bounties at Sydney might be altogether inadequate to meet the demands on it. Another despatch of Sir G. Gipps explains the causes which have led to the commercial distress in the colony, which he says occurs periodically, and arises from an excess of speculation or overtrading, and undue extension of credit by the banks. In addition to these general causes, Sir George assigns two special reasons—1st. The great fluctuation which had taken place in the price of wheat and all descriptions of grain since the scarcity of 1838; and the other the practice which, since the establishment of the Australasian Bank in London, he says, has greatly increased, of forwarding goods on speculation to New South Wales, and drawing upon the consignees in Sydney for two-thirds of the prices they are expected to realise; that not being able to meet with a market for their goods, or only at a heavy loss, the consignees are unable to take up the bills when due. Lord J. Russell briefly answers this despatch on commercial embarrassment by the remark that he entirely concurs in the opinion of the governor that it does not call for any legislative interference, but that the evil must be left to the natural course of events for a remedy. We learn also by these advices that the net decrease in the colonial revenue during the past year, was 85,303*l.* It is stated that the ordinary revenue had realised a net increase of 15,589*l.*, while the land revenue had sustained a net decrease of 73,225*l.* The remaining amount of net decrease in the year accrued in the proceeds of sale which did not properly belong to revenue.

Parliament.

HOUSE OF LORDS.

Monday.—After the presentation of petitions, the Earl of Glengall, in moving for returns respecting the number of rewards offered by the Irish Government for the detection of offenders, commented on some statements which had been made by Lord Wharncliffe on a previous evening, with respect to the condition of the county of Tipperary, and the influence of the Catholic clergy. He also defended the conduct of the landlords, and blamed the younger portion of the Catholic priests, whom he considered as largely implicated in exciting and perpetuating that contempt for social order which led to these outrages.

Lord Wharncliffe said that having been misunderstood, he would restate what he had said on the occasion referred to. He had stated that when sitting upon the committee two or three years ago, nothing had struck him more than the improved relations between landlord and tenant, but there did, nevertheless, occasionally appear instances where persons employed their rights of property in a harsh manner. He had not intended to throw blame on any particular class, but to account for some of the lawless proceedings that had occurred.

The Marquis of Normanby said that while he had been in office, and while exercising the duties of Lord Lieutenant, he had stated in that House, that the convictions had increased in proportion to the committals, and the committals in proportion to the reported offences. Such, he believed, continued to be the case. He was far from thinking that the Earl of Glengall was justified in asserting that the Roman Catholic clergy had promoted the commission of flagitious crimes. On the contrary, he could state that he had invariably received from the priesthood the most ready and efficient assistance for the detection and suppression of offences of every kind.

Earl Fortescue defended the Catholic clergy, as being, on the whole, an exemplary body, from whom he had received, while at the head of the Irish Government, most efficient assistance in the suppression of crime. A short debate ensued, after which the motion was agreed to.

The Model Prison Bill passed through committee.

On the motion of Lord Wharncliffe, the Fines and Recoveries (Wales and Cheshire) Bill, and the Roasted Malt Bill passed through committee, and were reported to the House.

The Punishment of Death (Ireland) Bill was read a third time and passed.

Lord Wharncliffe laid on the table a copy of the Queen's letter to the Archbishop of Canterbury.

On the motion of the Lord Chancellor, the Jurisdiction of Justices Bill, after some discussion, was read a second time.

Lord Galloway presented a petition against railway travelling on Sunday. The noble lord was proceeding to ask a question in relation to this subject, when the Duke of Buccleuch entered the house and whispered to the Lord Chancellor, the Duke of Wellington, and the other members of government, who immediately left the House. The Lord Chancellor almost instantly returned, and the fact of her Majesty having been shot at becoming known, their Lordships at once adjourned.

Tuesday.—The first business of importance was the agreeing to an address to her Majesty, congratulating her on her escape from the attempt on her life.

The Duke of Wellington in proposing the address said, My Lords, your Lordships must have heard with sorrow and dismay, and with feelings of deep indignation, the reports which have been in circulation of an attempt made on the life of her Majesty. It falls to my lot to perform the duty, on the part of Government, to state to your Lordships that an attempt was made last evening on her Majesty's life, which, by the blessing of Divine Providence, failed. My Lords, I avoid to-night entering into details upon these painful circumstances. I confine myself simply to the performance of my duty of stating the fact to your Lordships, and I shall move your Lordships to agree to present to her Majesty, an address of congratulation upon the failure of this atrocious and treasonable attempt upon her life, and which, by the interposition of Divine Providence, has been defeated; I will therefore propose such an address to your Lordships; I will afterwards submit to you, in the usual course, a motion that this address be communicated to the Commons, and that a conference with that House be invited, in order that they may join with your Lordships in addressing her Majesty on this subject. The noble duke then read the proposed address as follows:—"Most Gracious Sovereign—We, your Majesty's most dutiful and loyal subjects, the Lords spiritual and temporal, and Commons, in Parliament assembled, beg leave humbly to approach your Majesty's throne to express our abhorrence of the late treasonable attempt against your Majesty's sacred person, and our heartfelt congratulations to your Majesty and to our country on your Majesty's happy preservation from the danger to which your Majesty has been exposed. Attached to your Majesty by every sentiment of loyalty, and by a sense of the benefits which we derive from your Majesty's just and mild Government, we acknowledge with gratitude and humility the merciful interposition of Divine Providence which has been manifested on this occasion, and we make our earnest prayer to Almighty God that He will confer on your Majesty every blessing, and that He will continue to watch over and guard a life so justly dear to us."

The Marquis of Lansdowne said, he hardly knew whether it was right for him to interpose for one single moment to delay the adoption of a proceeding which must meet with the universal concurrence of that House. There could be but one feeling on this subject; there could be no hesitation; there could be no shadow of doubt, as to the proceeding about to be adopted by their Lordships. He could not, however, but feel that it was their duty, as legislators, not to stop here; but hereafter, when they came to contemplate whatever might be the sources which led to the extraordinary crime which had arrested their attention, to give their consideration, if it could be safely bestowed, to the causes which might have led to an event which was as great a phenomenon in human nature, if they looked to the absence of all motives, as it was the greatest of crimes, if they looked to the consequences which might have unhappily followed, but which happily did not ensue.

Lord Portman apologised for interposing for one moment. He wished to state a fact which would, if possible, tend to increase the attachment which their Lordships all felt towards her Majesty, and which he was sure would be so gratifying to their Lordships that they would forgive his interruption. He wished to state not only that her Majesty, with that confidence in the protection of the Almighty which would shield herself from all the danger that might at any time surround her, yet at the same time thoughtful for all those in her service, and feeling that yesterday a risk might possibly arise to those who attended her, declined to be attended by any of those ladies who usually accompanied her on her drive, because she would not risk for them the danger which might possibly occur to herself. Considering the situation held about the person of her Majesty by one very dear to him, he should not have done his duty if he did not express his gratitude to her Majesty individually, and he thought their Lordships would agree with him, that her Majesty's conduct was such as to endear her still more to all her subjects.

The address was then agreed to, and on the motion of the Earl of Shaftesbury was ordered to be communicated to the House of Commons, and that House invited to a conference on the subject. The deputation appointed to manage the conference returned in a short time and reported.

In the course of the evening, the Earl of Delawarr intimated to the House that her Majesty had fixed three o'clock on the following day for the reception, at St. James's Palace, of the addresses of both Houses.

The Royal assent was given by commission to the Irish Spirit Duties Drawbacks Bill, the Dublin Police Bill, the Queen's Prison Bill, the Turnpike Roads (Ireland) Bill, the London and Blackwall Railway Bill, and several private Bills.

On the motion of Lord Wharncliffe, the Pentonville Prison Bill was read a third time and passed.

A conversation of some length arose on the subject of the refusal of the Bishop of Quebec to permit a monumental tablet to an officer of rank in her Majesty's service, who had died in Canada, to be placed in the church under his jurisdiction. A question addressed by Lord Howden to the Bishop of London gave rise to the controversy, in which Lord Brougham arraigned the conduct of the Bishop of Quebec, who was defended by the Bishop of London; and after a few remarks from some other noble Lords the subject dropped.

The Marquis of Clanricarde moved for a copy of the regulations observed in the gaol of Newgate, and animadverted severely on the objectionable practice of exposing criminals under sentence of death to public curiosity, more particularly at what is called the condemned sermon.

Lord Wharncliffe expressed the disapprobation of Government at the practice, but said that they could not interfere with the civic authorities, with whom alone it rested to abolish the custom. Lord Normanby hoped that the present motion would have the desired effect, and result in the suppression of such demoralising exhibitions. After a few remarks from the Duke of Richmond, who joined in condemning the scene at the recent delivery of the condemned sermon in the case of Good, the motion was agreed to.

After some conversation respecting travelling and traffic on railroads and canals on Sundays,

The Lord Chancellor brought in a Bill to repeal the Act requiring attorneys to take out their certificates annually.

Wednesday.—Their Lordships met at two o'clock, for the purpose of presenting the Address to her Majesty.

The Earl of Shaftesbury, in the absence of the Lord Chancellor, took his seat on the woolsack. Several bills were forwarded in their respective stages.

The Lord Chancellor soon afterwards entered the House, and their Lordships immediately adjourned till Thursday; the Clerk at the table then called over the names of the Peers present, and each Peer, as his name was called, rose and left the House to take his place in the procession.

Thursday.—The Queen's reply to the address of both Houses of Parliament, was read by the Lord Chancellor. It was in the same form as that read in the House of Commons on Wednesday, given below.

The Income-tax bill was brought up by Mr. Green and other Members of the House of Commons, and on the motion of the Earl of Ripon, was read a first time, and ordered for a second reading on Friday next.

On the motion of Lord Cottenham, the bill for putting on record the testimony of witnesses in certain cases was read a first time, and ordered to be printed.

On the motion of Earl Fortescue, it was ordered that the constabulary returns of crime in Ireland be laid periodically before the House.

Lord Kinnaird, pursuant to notice, then rose to move for a select committee of inquiry into the causes of the existing distress prevailing in the nation. He said it was not to be denied that there was great danger in the present condition of the working classes in the manufacturing districts, whose distress was far beyond the reach of the Poor-laws. Population was increasing, while the means of that population was rapidly decreasing. He strongly disapproved of the Queen's letter, on the ground of its being exclusively addressed to the clergy of the established church, thus apparently excluding the clergy of all denominations from association in the work of charity; and he censured the application of public money, in anticipation of subscriptions, as if it were intended to conceal the serious magnitude of the distress. The Noble Lord then proceeded to enter into various statistical details, exhibiting the extent of distress prevailing throughout the country; and after commenting on the measures of the Income-tax and the Tariff, the latter of which he censured as being framed on no defined and coherent principle; and adding that he did not mean this as a party question, nor did he blame Government for anything, except for the Corn Law, he concluded by asking for a committee to inquire into the causes of the general distress.

The Duke of Wellington defended government in its adoption of the mode of advancing relief to distressed districts of the country, which was according to former precedents, and was even recognised by the law. He asked what was the object of this proposed inquiry? It was nothing less than a repeal of the Corn-law. His Grace then proceeded to recite the different measures that had been adopted by Ministers since their coming into office, in order to show that they were not chargeable with any blame for not having attended to the distress of the country in time. His Grace concluded by saying that he thought the noble Lord might have considered these matters a little, and have waited some short time to see the effect of the measures that had been adopted, before he moved for a committee of this description, the consequence of which must be (it could be nothing else) to excite discontent in the minds of one part of the community against another, and the main object of which appeared to be to obtain a repeal of the corn-laws. The noble Lord might make the same speech if he pleased in moving for a repeal of the corn-laws. But that would not suit the noble Lord's purpose. What the noble Lord wanted was, to have a committee proceeding day by day in its inquiries upon this subject, and having the noble Lord's calculations before it, purposely to create excitement, and to render it still more difficult for Parliament to legislate coolly and fairly upon the matter. He hoped that their lordships would meet the motion for the committee by a direct negative.

The Earl of Radnor said that the noble duke had misrepresented the arguments of Lord Kinnaird. He had not stated his object to be a repeal of the Corn-law. That Corn-law, he believed to be a main cause of the existing distress: nor had the recent alteration of the law been as yet of the slightest influence in alleviating the condition of the people.

The Duke of Richmond was satisfied that the line of argument adopted by Lord Kinnaird pointed to a repeal of the Corn-law. He felt as much as any of their Lordships for the distresses of the people, but such a committee of inquiry as this would rather aggravate than relieve that distress. The conduct of Government in advancing money to relieve the distressed districts was not only justified by former examples, but would be approved by the country. He could not but consider that Lord Kinnaird had permitted himself to be made a tool of by the Anti-Corn-law League.

The Marquis of Clanricarde thought it was unfortunate that the motion should have been resisted on the plea of a maintenance of the Corn-law: but, though approving of the motion, he recommended to Lord Kinnaird the suitableness of withdrawing it, as the proposed committee would lead into an inquiry too serious and extensive to be gone into with any hope, at present, of a practical result.—After a few remarks from Lord Western, Lord Monteagle wished to state, in confirmation of what had been said by the Duke of Richmond, that not only once, but repeatedly, during the time he was connected with the late Government, had that Government taken precisely the same step as had been adopted by the present Administration, both in sending relief to a distressed district, and in employing as an agent for the distribution of that relief, not the local authorities, but a responsible officer of Government. It should be recollected that in every year there was a certain unappropriated sum placed in the hands of Government, and no Parliamentary disapprobation had hitherto followed when portions of that sum had been devoted to an object like the present.

After a few observations from Lord Fitzgerald, the motion was withdrawn.

Friday.—Lord Beaumont presented a petition from the East India Committee of the Colonial Society, praying for the production of papers connected with the war of Afghanistan, and gave an historical narrative of the proceedings which led to and accompanied the occupation of that country by British troops. Lord Fitzgerald declined to follow the noble Lord in the details he had given, considering such a course would be unfair towards the late Government, and be productive of much public inconvenience. The policy of the Indian Government, he said, must be defended by others; but it certainly was an error to impute to the Emperor of Russia the present state of our affairs in India.

HOUSE OF COMMONS.

Monday.—Several petitions were presented, and the Witnesses' Indemnity Bill (Mr. Roebuck's) passed through committee.—Mr. T. Duncombe presented a petition from John Wrenn, of Southampton, offering to make certain disclosures relating to the bribery practised at the last and preceding elections in that town if he were protected by indemnity. On the motion that the petition be printed, a short debate ensued, which ended in its being agreed to.

On the motion for the third reading of the Income Tax Bill, Mr. S. Crawford proposed the following amendment:—"That as by the existing laws a large proportion of the people of this realm are excluded from voting for Members of Parliament; and as it also appears, by the reports of different election committees, that corrupt practices have been used to an extraordinary extent in procuring the return of Members to this present House of Commons; and as from both these causes, this House cannot be considered a fair representation of the people; it is, therefore, unfit that any system of increased taxation should be imposed by Parliament until all just causes of complaint with regard to the mode of electing the Members of this House shall be first redressed."—Mr. O'Connell seconded the motion.

Sir R. Peel trusted that the hon. gentleman would not charge him with intentional disrespect if he declined entering into the discussion which his speech would seem to invite. The hon. gentleman had the other night brought forward a motion in a more convenient form in his opinion than this, for the reform of the representation of the people in Parliament, and he then announced those doctrines and principles on which it ought, as he urged, to be founded, and he laid down, that unless Parliament subscribed to those principles no satisfaction would be felt by the people with any alteration of the constitution that could be projected. It was then open to the hon. gentleman to go into the discussion of those principles; but this motion was of a different character, and he thought of a much more extensive character, than the last; because it stated that the House was not competent to perform one of its commonest functions. If the House was not competent to legislate for the imposition of a property-tax, it was not competent to legislate on the tariff, and he thought the conclusion was inevitable, that it was not competent to the performance of any of its constitutional functions as a House of Commons. The right hon. Baronet concluded by saying that, in his opinion, if that House were not competent to perform this act of legislation, it ought to be shut up altogether, for it could not be considered competent to perform any act, and as he did not think it expedient to go into this question with regard to their constitution upon a motion of this sort, he must offer the most decided opposition to the hon. gentleman's amendment, as he had done the other night to the former motion.

After a few observations from Mr. O'Connell, Mr. Hume, and Lord J. Manners,

Lord J. Russell said, that as the resolution appeared to be one which, if adopted, would incapacitate the House to legislate on any subject whatever, he should vote against the amendment, though, subsequently, he should certainly take the sense of the House against the third reading of this bill.

The House then divided, when there appeared for the amendment, 21; against it, 156.

While Lord J. Manners was speaking, the tidings reached the House of the attempt that had just been made against the life of her Majesty; and when, upon the main question of the third reading, Mr. Baring began to address the House against the measure, Sir R. Peel interposed, and with great emotion, intimated the necessity of suspending the debate. He then suggested some necessary arrangements, and moved that the debate be adjourned till the following day. In reply to anxious enquiries from all parts of the House, if the Queen was safe, the right hon. Baronet stated that her Majesty was entirely safe, and that the assassin had been apprehended. Under such circumstances he hoped the House would see the propriety of adjourning. The excitement attending an event of this nature would, he was sure, prevent their paying attention to any other subject, and, as well from that cause as from respect to her Majesty, he should therefore beg leave to move that the House be adjourned till Tuesday.

Lord J. Russell, who also appeared to experience much emotion, then said:—After what has fallen from the right hon. gentleman, I take the liberty of at once seconding his motion. I am sure that the anxiety which must pervade the House under such circumstances, and the sentiments of gratitude which we must all feel towards Divine Providence that her Majesty's life has been preserved, will have excited such feelings as would render it quite impossible for us to attend to the details of any measure. I am very happy to concur, therefore, in taking the course which the right hon. gentleman now proposes, and I, at the same time, certainly hope that every endeavour will be made to place the assassin in safe custody.—The Speaker then put the question of the adjournment of the debate, which was carried.

Tuesday.—Before proceeding to any public business, the House received a message from the Lords, requesting a conference of the two Houses on the subject of the attempt on her Majesty's life. Several Members were appointed as managers, who at once proceeded to meet their Lordships, and during their absence all business was suspended. When they returned, Sir R. Peel stated at the bar, that the House of Lords had agreed to an address to her Majesty, and that they desired the concurrence of the Commons thereto. The address having been read, Sir R. Peel proposed that the House should concur in it, which he anticipated they would do unanimously. The right hon. Baronet then proceeded to say—"Scarcely two years have elapsed since I had to discharge the duty of seconding a proposal of a similar nature made by the noble lord (J. Russell); and it is with a mixed feeling of shame and indignation, that after the lapse of only two years I rise to discharge a similar duty. I should have thought that there would have been in the natural sympathies and feelings of human nature a protection against such an atrocious crime as that which has been committed. That a young Queen seeking innocent recreation from the toils and cares of business, in the presence of a beloved husband, should a second time have been exposed in this country to an attempt like this, fills me with feelings of shame and indignation. But those natural feelings of humanity have not constituted a protection for her Majesty." Sir R. Pell proceeded to narrate the circumstances attending the attempt on the Queen's life. Her Majesty, he said, from an intimation that a similar attempt had been meditated on the Sunday by a person of a description corresponding to that of the man in custody, had expected the attack, and had taken the humane precaution that no other female life should be endangered with her own; although she was determined that she would herself enjoy her usual exercise, and not be made prisoner by the dread of personal danger. The offender being committed for high treason, he would not now make any comment upon the facts. He was sure the whole country would concur with the two Houses of Parliament in expressing their abhorrence of the attempt, and their gratitude to heaven for her Majesty's preservation, as well as in praying for the further protection of a life so justly dear.

Lord J. Russell seconded the motion. The first feeling of th people, he said, would be that of gratitude for her Majesty's preservation. They would join in lamenting an act so atrocious and cowardly; but they would rejoice that nothing appeared from which conspiracy could be inferred. "Sure I am," said the noble Lord, "that when her Majesty goes abroad among her people, and when she takes those intervals of recreation and exercise, there is no one among her subjects who has less reason to fear the enmity of any single individual among the millions who constitute her subjects than her Majesty has." He trusted that the general abhorrence produced by the crime would tend to prevent any repetition of the same.

Mr. Lascelles thought it incumbent upon him, his lady being in the Royal household, to authenticate specifically the fact alluded to by Sir R. Peel, that the Queen had refused to permit the presence of her usual female attendants.—The address was then agreed to with unanimous acclamation.

Mr. Labouchere asked a question relative to the rumoured intention of the French Government to raise the duties on linen-yarn imported.

Sir R. Peel replied that some information of this nature had been received, but that Ministers had promptly given an expression of its regret at the adoption of this intention, should it be so determined on by the French Government. We were now, he said, engaged in such communications with other wine-growing countries, as might make the people of the south of France deeply regret the suspension of their intercourse with this country.

Mr. V. Smith put a question to Sir J. Graham relative to the unseemly proceedings in the chapel of Newgate, on occasions when the condemned sermon is preached to persons under sentence of death. He alluded more particularly to the case of the murderer Good. Sir J. Graham, in reply, expressed the entire disapprobation of Government in regard to the recent exhibition, and stated that a remonstrance had been sent to the city authorities.

On the motion for the third reading of the income-tax. Mr. Hume expressed his dissatisfaction at the financial policy of Sir R. Peel, and lamented that his own frequent warnings had not been attended to. Instead of making reductions in the public expenditure, Sir R. Peel was laying on fresh taxes to be spent in mischievous wars. He concluded by saying he should oppose the bill. Sir C. Napier objected to the present tax only on account of its inequality. After some observations from Col. Wyndham and Mr. Curteis, Mr. F. J. Baring asked if this were a bill which apportioned the burden of taxation fairly and equally on the public? There was no allowance to be made for losses under different schedules; and a merchant might have to pay his income tax on a given amount of stock, while his losses in trade might be double the amount of his dividends, and thus the actual result leave him without any income at all. The moral influence of this tax was also to be taken into account, as its tendency, from its inquisitorial nature, would be disastrous to the character of the country. Indeed, he believed injustice to be inseparable from the principle of such a bill; and with that sentiment he should give his cordial opposition to the third reading.

The Chancellor of the Exchequer said that the principle of this bill was the same with that of the bill which proceeded from the Administrations of 1803 and of 1806, but modified by several improvements. It was the principle of Mr. Pitt, and it was the principle of Mr. Fox, each of whom was convinced that property and income ought both to bear this burden. The real question now was, whether Parliament should meet the necessities of the national finance, and relieve those classes which were suffering the most severely. Mr. Goulburn proceeded to state that the tax is to be placed under the Commissioners of assessed taxes, who will be enabled to collect it at an additional cost of about 30,000*l*. to their present establishment; and the entire expense, including establishment, salaries, travelling expenses, &c., will not be above one-half the expense of the collection of the former income-tax, which, in 1815, was about 300,000*l*. It had been proposed to exempt the first 150*l*. of every income, but he found that the effect of such exemption would be to withdraw from the tax 33,000,000*l*. of income, which would have made a higher rate necessary for incomes left subject to the tax.

After some observations from Mr. Mangles,—Sir R. Inglis contended that the exemption of the first 150*l*. of income, as he had proposed, would remove the temptation to perjury in a large number of cases. Mr Villiers said that the income-tax was politically unwise, and practically unjust. Its necessity had arisen from bad legislation, interfering with trade, limiting the home market, diminishing expenditure, and deteriorating the condition of the people. Messrs. D'Israeli and Brotherton then took part in the discussion: after which the House divided, when there appeared for the third reading of the Bill, 255; against it, 149: majority for the third reading, 106.

Certain amendments were then proposed by the Chancellor of the Exchequer, to one of which an exception was taken by Mr. G. W. Wood, and another division took place, when there appeared 199 to 96 in support of Government. The bill then passed its final stage.

Wednesday.—The House met at three, and having adjourned till five o'clock, the Members present joined with the Upper House, and proceeded to present the address of the two Houses of Parliament to her Majesty.

The House having resumed pursuant to adjournment,

The Speaker reported to the House that both Houses of Parliament had waited on the Queen with a loyal and dutiful Address, to which her Majesty had returned the following answer:—

"My Lords and Gentlemen—I receive with the most heartfelt gratification this loyal and dutiful Address from my two Houses of Parliament.

"I am thankful to Almighty God, whose merciful care has saved me from this danger. I humbly rely on the good providence of God, which is able to preserve me from every danger; and, firm in this trust, and sincere in my desire to promote the happiness of my people, I am comforted and supported by this renewed assurance of your devotion and attachment."

After the presentation of some petitions relating to the Southampton election, Mr. Mackinnon moved the new writ for Southampton, which has been repeatedly deferred in consequence of the pending questions of bribery in that borough. He relied on the issuing of the writ for Ipswich, as a reason for his motion being granted. Mr. W. O. Stanley moved, as an amendment, and Mr. Ward seconded the motion, that a committee be appointed for inquiring into the extent of the corruption there. Mr. Fleming assured the House, that the zeal which had sought the suspension of the writ arose solely from the refusal of the Conservative majority at Southampton to acquiesce in a proposal for allowing the Liberals to return one member at the next election.

Mr. Macaulay expressed his regret that the Ipswich writ had been issued, and argued, that when the writ for so important a constituency as that of Nottingham was suspended, on the mere allegation of an hon. member, there were ample grounds for the continued suspension of that of Southampton. He concluded by saying that in order to put down the growing curse of bribery, both political parties must concur.

Sir R. Peel, agreeing in the last position, was yet resolved to determine these judicial questions upon strictly judicial principles. He proceeded to justify his own vote for the issue of the Ipswich writ, and said he would always vote on each case according to its own respective merits. The allegations against Southampton had made a strong impression upon his mind, and the writ, in his judgment, ought to be suspended until Lord J. Russell should have had an opportunity of explaining his views upon the general remedy.

Mr. T. Duncombe was persuaded that a strong case could be proved against Southampton by an individual of the name of Wrenn, who, in a petition to the House, had offered to give evidence of extensive bribery there. After some observations from Mr. H. Hinde, Mr. Wynn expressed his satisfaction at the course which had been adopted by Sir R. Peel, in which he cordially acquiesced. He recommended the withdrawal both of the motion and the amendment, leaving the issue of the writ suspended for a short time. Mr. W. O. Stanley then withdrew his amendment, and Mr. Mackinnon his original motion.

The House then proceeded to the other orders of the day, and went into committee upon Capt. Rous's Bill for the better regulation of public-houses. After considerable discussion respecting a clause prohibiting vessels lying at anchor in the Thames from selling liquor during the hours of divine service, another discussion arose on clauses brought forward by Mr. B. Wood, proposing to rectify irregularities in the time of opening and shutting public-houses, and to give a uniform definition of the hours of divine service, namely, from eleven till one, and three till half-past four, on Sundays.—Capt. Rous supported the clause, as one which he had himself intended to introduce in the bill, but had omitted in deference to Government. After a short debate the clause was rejected by a majority of 110 to 7.

Mr. Alderman Humphrey proposed a clause permitting all public-houses in the metropolitan district to open from and after one o'clock on Sundays. This was rejected by 69 to 27. The bill then passed through committee.

Mr. Redington proposed the second reading of the Sudbury disfranchisement bill, on which some discussion arose, ending in the postponement of the motion till next Wednesday.

Mr. C. Buller then resumed the adjourned debate on the Bridport election compromise and bribery inquiry. The House having agreed on the main point, that an inquiry should take place, it only remained to settle by whom that inquiry should be conducted, which Mr. C. Buller considered should be referred to Mr. Roebuck's committee. Mr. G. Bankes strongly opposed the motion. A discussion arose, after which the House divided, when the motion was carried by 44 to 16.

Friday.—After some routine business connected with election committees, the London and Croydon Railway Bill was thrown out on a division by a majority of 148 to 88. The Speaker announced that the Sunderland Election Petition was withdrawn.

The House then resolved itself into a Committee of Ways and Means for the consideration of the sugar duties. The Chancellor of the Exchequer moved that these duties be continued for another year, when Mr. Roebuck moved an amendment to reduce the duty on foreign sugar to the rate of that now levied on colonial sugar. After a debate in which Mr. Gordon, Mr. Gladstone, Mr. Labouchere, Lord J. Russell, and Sir R. Peel joined, the amendment was negatived by a majority of 41. Mr. Labouchere then moved an amendment reducing the duty on foreign sugar to 30*s*. per cwt., and on colonial sugar to 20*s*. per cwt. This was opposed at considerable length by Mr. Gladstone, and negatived by a majority of 81. The resolution was then agreed to, and the report ordered to be brought up on Monday.

CITY.

Money Market, Friday.—The closing quotation for the account is 91½ to ⅝ ex. div.; for Three per Cents. Reduced, 91½ to ⅝; for Three-and-a-half per Cents. Reduced, 108 to ¼; and for New Three-and-a-half per Cents., 100⅞ to 1¼. Exchequer-bills 42s. to 44s. premium; Bank Stock, 167½ to 8½.

Metropolis and its Vicinity.

Wood Pavement.—At a meeting of the Marylebone vestry, on Saturday, the long agitated question of wood-paving in Oxford-street again came under discussion. We stated in our last, that at a vestry meeting on the previous Saturday a resolution was carried, in opposition to previous resolutions of the vestry, that no further wood-paving should be laid down in Oxford-street, or the subject entertained, until the expiration of the present contract with the Metropolitan Wood Paving Company, which does not terminate until the year 1845. In consequence of this decision, a public meeting of the inhabitants of Oxford-street was held, at which resolutions strongly condemnatory of the conduct of the majority of the vestry who had carried such a resolution were passed, and at which it was determined that the vestry's opinion should at once be tested upon the question of paving or non-paving Oxford-street with wood, from Wells-street to Vere-street. A meeting was consequently held on Saturday, and considerable interest having been excited by the question, it was very numerously attended. Mr. Joseph moved, and Earl Manvers seconded, the non-confirmation of the minutes of the preceding meeting. The question was put, and the non-confirmation declared to be carried by a majority of 50 to 26. It was then moved that the report of the committee accepting the tender of the Metropolitan Company to pave Oxford-street from Wells-street to Vere-street forthwith with wood, be adopted. On a division the numbers were—For the motion, 36; for the adjournment, 15; Majority affirming the immediate carrying out wood-paving in Oxford-street, 21. Mr. Thomas then gave notice that the vestry, having by a large majority affirmed the principle of wood-paving, he should move at the next meeting that the entire streets of the parish of Marylebone be paved with wood.

Public Meetings.—On Tuesday meetings were held of the Courts of Aldermen and Common Council, at which, after the communication from Sir J. Graham to the Lord Mayor, announcing the attempt on her Majesty's life had been read and ordered to be entered on the journals of the respective Courts, it was resolved unanimously that addresses should be presented to the Queen congratulating her Majesty upon her escape from the recent attempt on her life. The Courts were very numerously attended, the proceedings exciting considerable interest, and the addresses were carried by acclamation. It was also resolved that addresses be presented on the same occasion to Prince Albert and the Duchess of Kent.—The half-yearly meeting of the Peninsular and Oriental Steam Navigation Company has been held, to receive the report of the directors, and to declare a dividend for the six months ending the 31st March. The report stated the receipts of the company for that half-year to be 3,900*l*. in excess of the previous half-year; that 11,402 shares of 50*l*. each had been subscribed for; that the paid-up capital of the company amounted to 400,787*l*. 10*s*.; and that instalments to the amount of 169,312*l*. were available for the further extension of the company's operations. It also stated that 703 additional shares had been subscribed for in India, where a favourable feeling towards the undertaking had been manifested. The Hindostan steam-ship, of 1,800 tons and 520 horse power, would, it was reported, proceed to take up her station between Calcutta, Madras, Ceylon, and Suez, in Sept., and the Bentinck, of similar size and power, would soon follow for the same destination. It was stated that arrangements for improving the transit of passengers and goods through Egypt were in active progress, and that fresh assurances of the support and co-operation of the Pacha of Egypt in effecting them had been recently received. A dividend of 3½ per cent. for the half year was declared, and the report was adopted unanimously.

Review in Hyde Park.—On Wednesday morning a review of the Guards took place in Hyde Park before Prince Albert the Colonel in Chief, the Duke of Wellington, several general officers, and a numerous staff. His Royal Highness arrived on the ground at 8 o'clock, when the regiment was drawn up in line. The Prince, accompanied by his staff, having closely inspected the troops, took up a position in another part of the park, when the regiment marched in slow and quick time. The two battalions then went through a variety of evolutions, with which the Prince expressed himself much gratified. The concourse of persons at the commencement of the review was not great, but before it terminated the numbers had considerably increased. His Royal Highness and the Duke of Wellington were loudly cheered as they left the Park.

Metropolitan Improvements.—Several improvements are at present making in Westminster. Vincent-square is to be inclosed with an iron railing, instead of the present wooden fence, and the interior is to be planted. The centre will still be retained for a cricket-ground for the Westminster scholars. Rochester-row is to be repaved, and the carriage road raised to make a more commodious entrance to the squares and streets erecting in the neighbourhood. The Dean and Chapter are also erecting a church in Chapel-street, on the spot where the chapel formerly stood.

New Houses of Parliament.—The progress of these buildings has been very active since the late disagreements among the workmen. It has now arrived at the first tier of apartments, and the corbels for many of the windows already display numbers of shields, charged with the Royal arms of England before and after the Conquest, together with those of the Royal Continental houses with which the present reigning family is allied.

Provincial News.

Bradford.—A serious explosion of fire-damp, attended with loss of life, occurred on Monday, in a coal mine at Dudley hill, near this town. It seems that a man was engaged repairing the shaft of the engine pit, when suddenly an explosion took place, and he was thrown up to the mouth of the pit, a distance of sixty or seventy yards—and, falling back again to the bottom of the shaft, was killed on the spot. The explosion was so violent that the report of it was heard at a considerable distance; the covering of the pit was carried away, and the buildings in the vicinity shook, it is said, as though from the effects of an earthquake. Another miner, employed in a different part of the pit, was so seriously injured that he is not expected to recover.

Brighton.—A public meeting has been held in this town for the purpose of petitioning Parliament to insert in Sir J. Graham's New Poor Law Bill a clause exempting this town, and other places governed by local acts, from the operation of the rules and regulations of the Poor Law Commissioners. Mr. J. Cordy was called to the chair, and was supported by Capt. Pechell and Lord A. Hervey, the borough members. Mr. Folkard first addressed the meeting, and, after a few remarks, moved the first resolution—"That the town and parish of Brighton, having on various public occasions expressed their decided opposition to the introduction of the Poor Law Commissioners into this town, the present meeting emphatically reiterate that opinion, under the conviction that Brighton, from its population and importance, was entitled to retain its self-government under a local act." The resolution was seconded, and carried unanimously. Mr. G. Dempster then rose and addressed the meeting. He said that Government were endeavouring to deprive this town of their local act, the operation of which had given universal satisfaction both to the ratepayer and the poor, for the mere sake of the abstract principle of uniformity, which the Commissioners had themselves been obliged to give up. After some further remarks condemning the different clauses of the New Poor Law, Mr. Dempster concluded by proposing a petition to Parliament, praying that this town might be exempted from the operation of the orders of the Poor Law Commissioners. The motion was carried unanimously; and the Chairman was directed to sign the petition on behalf of the meeting. It was then moved that the borough members present the petition, and that the members for East Sussex be requested to support the prayer. Capt. Pechell, M.P., said he was opposed to the Bill both in principle and detail; and he would endeavour not only to mitigate the severity of the law, but to abrogate the power of the Poor Law Commissioners. He was not only opposed to the introduction of the power of the Commissioners into this town, but to their power altogether; and he should feel it his duty to take every opportunity of dividing the House in every stage of the Bill. Lord Hervey said he should cordially concur with his colleague in endeavouring to prevent this town from being placed under the power of the Poor Law Commissioners.—The report which appeared in the morning papers of last week, announcing the death of the Earl of Coventry, and which was noticed in our last number, proves to have been unfounded. It originated from a misapprehension on the part of the correspondents of those papers, occasioned by the fact that a relative of his Lordship, T. D. Coventry, Esq., of Greenlands, near Henley-on-Thames, died on the day mentioned. The Earl of Coventry has for some time been in a declining state of health; and this fact appears to have operated in causing the misapprehension.

Burnley.—Intelligence of a serious character is said to have been received by Government from this town and neighbourhood, which occasions fears for the continued peace of the district. It is stated that the guardians of the union have represented to the Secretary of State that the distress is beyond their means of relief; that they have 12,000 persons on their books, and must leave the matter in the hands of Government. The accounts add that Sir J. Graham has sent down a special commissioner, who has applied to Government for £500, which has already been distributed; and that more is required, and will be immediately forwarded. The cause of the distress appears to be the depreciation in the value of manufactured goods, and the inability on the part of the labouring classes to procure work of any description. It is stated that the artisans who are in full work only earn 3*s.* 9*d.* per week. On Sunday, 20,000 people met at Enfield; and great apprehensions of an outbreak appear to be entertained.

Dudley.—The tranquillity of this town and neighbouring district has not yet been restored, and the last few days have furnished fresh proof of the determination of the colliers to persevere in their resistance to the terms proposed by the masters. It seems that on Wednesday morning information was conveyed to the magistrates of this town, that a party of colliers had proceeded to Shut End, about midway between this place and Stourbridge, with the intention of cutting the ropes at the colliery. The magistrates at once gave orders that the military should be put under arms, but it was some time before they could be assembled, in consequence of the presumed tranquillity of the neighbourhood having led the officers to take up their quarters in different parts. Considerable excitement was raised in the town from the activity which prevailed among the non-commissioned officers, and serious fears were entertained by the inhabitants. In a short time, however, the troops assembled, and, accompanied by several magistrates, proceeded to Shut End, where the acts of violence intended had already been carried into effect, but unattended by any other serious consequences. They then proceeded in search of the offenders, but they had succeeded in making their escape, and have not yet been apprehended. It is stated that the number of persons now out of employment in this district amounts to 15,000. Of these 14,000 are voluntarily absenting themselves from work, and the remaining 1,000 are deterred from accepting the terms of the masters by the threats of their fellow-workmen, and are consequently reduced to a state of great distress.

Hayes.—A vestry meeting has been held in this parish for the purpose of making a church rate; a subject which appears for some time past to have caused a good deal of excitement in the town. The Rev. Mr. Hale, curate, took the chair. One of the churchwardens briefly stated the necessity which existed for a rate to be made, in consequence of the extensive repairs required in the belfry and other parts of the church. The motion having been seconded, Mr. J. Hunt rose to oppose the rate, and moved the following amendment:—"That all compulsory enactments for the support of religious institutions were contrary to the principles of Christianity; and that the question be adjourned for a twelvemonth." The amendment was seconded, and a long debate ensued, after which the question was put to the meeting, and the rate declared to be carried: the numbers for the amendment being 21; against it, 42; majority for the rate, 21.

Kendal.—A local paper states in proof of the extent of pauperism in this town, that in 1839, for the quarter ending in March, there were in this township alone 618 paupers; in 1840 the number was 953; in 1841 it increased to 1,091; and in the same quarter of the current year there were no less than 1,351, which, with the addition of 154 for Kirkland, made the number of 1,505 individuals, or one-eighth of the population, receiving relief. In 1839 the expenditure for this township alone was, for the March quarter, 614*l.* 13*s.* 1*d.*; in 1840, 819*l.* 4*s.* 6d.; in 1841 it rose to 911*l.* 6*s.* 5*d.*; and this year it amounts to 1,059*l.* 10*s.* 11*d.*

Maidstone.—A meeting of hop-planters and owners, and occupiers of woodlands in this county has been held, for the purpose of taking the sense of the county upon the protection now by law given to the British grower of hops; and upon the injury to be apprehended from any alteration of the law upon that subject. H. Hoare, Esq., High Sheriff of the county, presided. Mr. Whittaker, in proposing a series of resolutions to the meeting, observed that the proposed alteration in the duty on hops was one which would affect their interests most materially; and he had formed part of a deputation appointed to wait on Sir R. Peel on the subject, when Sir Robert told them that if they could show any peculiar risk or ground upon which the present almost prohibitory duty ought to be continued, he would attend to it. They had accordingly shown him the risk incurred in the cultivation of hops, from blight and other causes, and also that the proposed alteration could not have any material effect upon the price of beer, and that it would only benefit the speculator; at the same time pointing out the ruinous tendency of the proposed change. Notwithstanding, however, these representations, Sir Robert Peel, he said, had carried out his scheme; and he was of opinion that they ought not quietly to acquiesce in it, but that it was their duty to protest against it. He then proposed the resolutions, which stated that the meeting viewed the change in the law with great apprehension. He concluded by entering into some details, and by expressing an opinion that the effect of the alteration in the duty would be to destroy entirely the cultivation of hops in this country, and cause the whole supply to be taken from foreign countries. Lord Torrington seconded the resolutions, and said that he concurred with the opinions expressed in them, that the effect of the alteration of the duty would be to destroy the cultivation of hops in England, and if this meeting had not been held it might have been said that the hop-growers and farmers of this county were agreeable to the proposed change, which was far from being the case. He then went into some details, and said he had no doubt that hops could be grown abroad for 50*s.* per cwt., and that the average price of hops in this country would never exceed 4*l.* per cwt.; that they were all aware such a price would not enable them to carry on the cultivation of their lands, and the consequence must be that a large amount of agricultural labour would be thrown out of employ. The noble Lord concluded by saying that the Tariff would, in his opinion, prove ruinous to the country; and he regretted to see that a Parliament, which was returned, in a great measure, by the agricultural constituencies of the empire, should have sacrificed those whose interests they were bound to have protected. Several other gentlemen addressed the meeting, and finally the resolutions were put and carried unanimously.

Newcastle.—In consequence of representations recently made to Government by a deputation of coal owners from this town, and other coal districts, it is said that the Chancellor of the Exchequer has intimated that, having given the subject full consideration, Government are prepared to recommend that the duty on the export of coals to foreign parts be fixed at 2s. per ton, and not at 4s. as first proposed: the duty to be uniform on all descriptions of coal.

Newport (Isle of Wight).—In our last we gave a report of a public meeting in this town on the subject of church rates, when a motion for the imposition of a rate was strongly opposed, and the sense of the meeting being taken, it was declared to be lost. A poll was then demanded, which has since taken place, and terminated as follows:—Against the rate, 165; for it 73; majority against the rate, 92.

Newton.—A public meeting has been held in this town for the purpose of considering the propriety of addressing Sir J. Graham on remarks made by him during the late debate on the New Poor Law, stating "that the information from the Manchester Union was that it worked well in the out-townships." Mr. N. Varley, one of the High Constables, took the chair. Mr. J. Leigh, a manufacturer, first addressed the meeting. He commented on the statements of Sir J. Graham, which he reprobated in strong terms, and said that he should move that a letter be sent from the meeting to Mr. Grimsditch, the member for Macclesfield, putting that gentleman in immediate possession of the facts, so that he would be enabled to refute the statements of Sir J. Graham in the House of Commons. Mr. D. Boote said that he should object to such a letter being sent to Mr. Grimsditch; he should move as an amendment "that the meeting should petition for a total repeal of the law." He was afraid that Sir J. Graham and his party were intending to pass a worse law, if it were possible, than the previous one. A long discussion ensued, during which several of the working men addressed the meeting, expressing themselves in favour of a strong remonstrance to Government, praying them to withdraw the measure. This, they were of opinion, would be the best answer to the statements of Sir J. Graham. It was ultimately agreed that the amendment should be withdrawn, on condition that a petition for the total repeal should be sent to Parliament at the same time. This was agreed to, and the motion that the letter be presented to Mr. Grimsditch was then passed. A petition for the total repeal of the New Poor Law was subsequently adopted and signed.

Oxford.—Public attention has been excited by a new subject of controversy which has sprung up in this University, and which has already created considerable interest. It appears that in 1836, Dr. Hampden having been appointed Regius Professor of Divinity, drew upon himself the censure of the College by the publication of certain doctrines contained in a sermon published by him some time before. A large majority of the members of Convocation condemned Dr. Hampden's doctrines, and deprived him of the usual privileges of his office, by dispensing with, or rather discountenancing, that attendance on his lectures which had been regarded as a necessary qualification for holy orders. In this position the University has since remained with respect to the Professor of Divinity. Dr. Hampden has denied, subsequent to as well as before his condemnation, the heterodox inference drawn from his writings, but has not recanted them; and the University censures have continued in force up to the present time, the Regius Professor remaining destitute of his accustomed authority in the University. It seems that it is now the intention of the Heads of Houses in the University to propose the withdrawal of the censure passed on Dr. Hampden. It has been announced that a motion will be proposed to Convocation summoned for Tuesday next, the object of which is to abrogate the statute of May 5, 1836, and to re-instate the Regius Professor of Divinity in all the privileges annexed to his office. The proposal is expected to meet with considerable opposition; and the result of the contest is looked forward to with great interest.

Portsmouth.—During the past week the operations against the wreck of the Royal George have been resumed, and a considerable portion of the loose timbers have been brought up and landed at the Dockyard. It is expected that during the summer the wreck will be so completely removed that the anchorage will be quite clear. A long brass 24-pounder, that formed part of the armament of this ill-fated ship, has been mounted on the King's battery, on a carriage made from a portion of the wreck. The gun was cast in 1743, and appears to be little injured by its long continuance under water.—A contest has taken place in Portsea on the subject of church-rates. At the vestry meeting last week a rate was proposed by the churchwardens, and strenuously resisted by the meeting. A poll was finally demanded, which terminated in the loss of the rate: the numbers being, for the rate, 768; against it, 1,318; majority against the rate, 550.

Windsor.—We have stated in former numbers that the extensive kitchen-gardens belonging to the Crown, comprising the gardens at Cranbourn and Cumberland Lodges in the Great Park, the Maestricht gardens in the Home Park, and the Royal kitchen-gardens at Kensington, are about to be immediately consolidated into one spacious kitchen-garden (containing between 20 and 30 acres of superior arable land), now arranging under the superintendence of Mr. Ingram, in the grounds attached to Frogmore Lodge. In consequence of this arrangement, the whole of the building materials, including five spacious hothouses, gardeners' sheds, and other erections at Cranbourn Lodge, have just been sold by auction, by order of the Commissioners of her Majesty's Woods and Forests. As soon as the new gardens at Frogmore are brought into a state of cultivation, the Maestricht gardens will be thrown into the Home Park, from which they are now divided by a high brick wall, some hundreds of yards in length; and the gardener's house and the other buildings will be disposed of by the Woods and Forests. The new gardens will comprise an extensive grapery and pinery. The whole of the forcing and hothouses will be heated upon a novel plan, by means of hot water, and will extend in one line to the length of upwards of 250 yards. Close to these will be erected a residence for Mr. Ingram, the superintending gardener, with a spacious conservatory, according to the original plans, on either side. The garden is now enclosing by a substantial brick wall, 12 feet in height, which will afford great facility for the cultivation and rearing of wall fruits. The whole of the expenses incurred by these extensive improvements will be met by the disposal of the site of the Royal gardens at Kensington, which will be let on building leases. It is calculated that the ground-rents will realise a sum amounting to between 28,000*l.* and 30,000*l.*—A few days since some interest was excited in this town by a public exhibition of an unusual character. A Signor Duvalla performed the feat of walking on a tight rope over the river, upwards of 300 feet in length, and nearly 50 in height at one extremity, in the presence of a great number of spectators. It is also stated that he has announced his intention of making an ascent and descent from the Little Park to the top of the Round Tower of Windsor Castle, if he can obtain permission, in the ensuing month.

Railways.—The following are the returns of the principal railways for the last week:—Brighton, 3,090*l.*; Blackwall, 1,194*l.*; South Western, 6,828*l.*; Great Western, 14,117*l.*; Northern and Eastern, 1,452*l.*; Greenwich, 2,188*l.*; Eastern Counties, 1,087*l.*; Edinburgh and Glasgow, 2,111*l.*; York and North Midland, 1,654*l.*; Great North of England, 1,438*l.*; Midland Counties, 2,922*l.*; North Midland, 4,430*l.*; Birmingham and Derby, 1,254*l.*; Manchester and Leeds, 5,200*l.*; London and Birmingham, 16,255*l.*; and Manchester and Birmingham, 700*l.* An official circular has been forwarded by the Board of Trade to the directors of the different railways, stating that their attention having been drawn to the practice of locking the doors of railway carriages in consequence of the recent disaster on the Paris and Versailles Railway, their Lordships have referred the subject to the Inspector-General of Railways, Major-Gen. Pasley, who has reported to the following effect:—"That his opinion is decided that passengers in a railway carriage ought not to be shut in by locking both doors, without the power of getting out, though it is proper and useful to lock all the carriage doors on the off side towards the middle of the railway, where they might be crushed by a train moving on the other side; that if the passengers have the power of getting out on the near side of the train only, it may be the means of saving their lives under many circumstances, which are too obvious to require explanation, and that the opposite practice of locking up the passengers is said to have caused the loss of many lives which might otherwise have been saved in the late lamentable catastrophe at Paris. That the practice of locking both doors has been adopted by one or two companies in this country, from a belief that it is safer to deprive passengers of the means of jumping out when the train is in motion; but that this precaution is of little use in the case of third class carriage passengers, who travel in open carriages, and can seldom be of use except in the case of persons reckless from the effect of liquor, or devoid of common prudence, in which case any accident that might occur would be justly attributed to the individual himself, while, in the case of lives being lost in consequence of the passengers being locked up, the blame would be properly attributed to the directors." A reference to the late accident on the Paris and Versailles Railway, together with that which occured in Oct. last on the London and Brighton line, also induces their Lordships to recommend that, where it is necessary to employ two engines in drawing a train, care should be taken not to use engines of different power and construction, and especially not to place a four-wheeled engine immediately in front of one with six wheels. It is understood that the directors of the Great Western Railway have decided on discontinuing the system of locking in the passengers.

IRELAND.

Dublin.—It is stated that every arrangement has been completed with Government and the board of works, preliminary to the commencement of the railway line between

Kingstown and Dalkey on the atmospheric system; and that the works will be in full operation in the course of the ensuing month. The accounts from the provinces are said to be very favourable for the agriculturists. The corn crops throughout large districts of Limerick, Cork, Clare, and Galway, are represented as being in a forward state, several fields of wheat already runing into ear. A few days since a large field of meadow hay was cut near Loughrea. The Tipperary papers state that the recent variable weather, fluctuating between copious showers and warm sunshine, has been peculiarly favourable, and that the spring corn is coming up with great vigour and freshness. Potato planting and turnip sowing are proceeding well, and the reports of the May fairs continue favourable.—The Repeal Association held its weekly meeting on Monday. The proceedings, however, which consisted in the reading several letters, present nothing of interest. The week's rent was announced to be 105*l.* 3*s.* 5*d.*—In the Prerogative Court on Wednesday, Dr. Radcliffe pronounced judgment in the case of the Deanery of St. Patrick, for the vacancy in which there are two claimants—the Rev. Dr. Wilson and the Rev. Robert Daly. The case has been long litigated and has created some interest. The point at issue was the admissibility of the votes of the Archbishop of Dublin and the Rev. Dr. Todd for Dr. Wilson. **The judgment of Dr. Radcliffe was in favour of the Rev. R. Daly, who is consequently now dean of** St. Patrick.

Kilkenny.—The neighbourhood of Johnstown in this county was thrown into some excitement on Sunday, by the report that Mr. George Healy, a gentleman of large property, residing at Violet Hill, had been burned to death in his bed, and a great portion of the house consumed. An inquest has been held, at which it appeared that some labouring men, passing the house at the time, heard the servant calling for assistance, and perceiving the building to be on fire they entered the house, the front door of which they found open, and on proceeding to Mr. Healy's bedroom discovered that gentleman in his bed burnt to death. A barrel of gunpowder which, however, had not ignited, was found open within three yards of the corpse, being only partially covered with a piece of brown paper thrown over it, and another barrel of gunpowder was discovered in the adjoining room. It appeared that Mr. Healy had been in the habit of reading in bed, and having his candle burning till the morning. It was supposed that the candle fell and set fire to the bed clothes. The suspicious circumstance attending the case is that of the hall door and one of the lower windows being found open, which the housekeeper deposed were shut when she went to bed after deceased. It also appeared that a wicker-gate in the rear of the house had been forcibly broken open. The evidence was of a conflicting character, and leaves the matter in considerable doubt. The verdict was as follows: "That deceased was found dead in his bed on Sunday morning, the 29th inst., but whether his death was caused by accident or otherwise, we have no means of ascertaining."

Tipperary.—The local papers inform us that there are some indications of improvement in the peace of this county; and since our last, there appear to have been few outrages or disturbances of the peace. The same papers mention that the Roman Catholic clergy have rendered themselves obnoxious to the disturbers, by their exertions to draw away the peasantry from the illegal societies.

SCOTLAND.

Edinburgh.—On Monday, the general assembly met and pronounced a sentence, suspending from their judicial functions in Presbyteries and all the superior church judicatories, till the first Wednesday of March next, the following reverend gentlemen, viz.:—Drs. Bryce, Stirling, and Grant, the Revs. J. Robertson, A. Cushnie, G. Peter, C. Hope, J. Wilson (of Walston), J. Cook (Haddington), and the Rev. Mr. Hill (of Logieport); and they have reserved for the consideration of the commission Mr. W. Mearns, minister of the Royal Bounty Church at Glenrinnes—the son of Dr. Mearns of Aberdeen. Next followed the deposition of the Rev. D. Wilson, of Stranraer, on the ground that he had applied to the court of session for an interdict against the Presbytery of Stranraer, because there are in it a *quoad sacra* minister and elder—the said Presbytery acting at the same time in direct and avowed defiance of an injunction from their ecclesiastical superiors. In the evening, after a variety of unimportant matters, Mr. Middleton, the minister of Culsamond, and the majority of the Presbytery of Garioch, who had inducted him, were again called to the bar; and after some discussion, their case was referred to the commission.

Law.

COURT OF CHANCERY.—*Rogers* v. *Grazebrook.*—This was an appeal against an order of the Vice Chancellor of England, directing a sum of 1,090*l.*, the amount received upon a policy of assurance, to be paid into court. The plaintiff was mortgagee of premises belonging to a party of the name of Hunt, a millwright, and the policy was effected in the Phenix-office, for the additional security of the money advanced, in the joint names of the plaintiff and Mr. Hunt. A fire occurred, and the amount of the loss was assessed at 1,090*l.*, which was paid by the office to the assignees of Hunt, who had become bankrupt. The claim of the mortgagee was disputed, on the ground that his security had been obtained on a usurious consideration. The Lord Chancellor, in delivering judgment, observed that as regarded the sum of 590*l.*, he concurred in opinion with the Vice-Chancellor, and that sum must be paid into Court by the assignees. The policy was for the benefit of the mortgagee, and the amount received upon it, in respect of the premises contained in the mortgage, must be applied for his repayment. As to the remaining 500*l.*, that was paid by the Phenix-office as compensation for machinery destroyed, which had not been the subject of mortgage. His Lordship added that the special circumstances did not qualify this decision, for as to the usurious transaction mentioned, the Court would not assume illegality, which must be precisely proved. The allegation here was not sufficiently supported, and he could only vary the order appealed against by reducing the amount to be paid into Court, which must be done within one month.

VICE-CHANCELLOR'S COURT.—*Adams* v. *Adams.*—The testator in this cause gave all his real and personal estate to trustees, for sale and distribution amongst his children, "subject, nevertheless, to the dower or thirds at common law of his wife, Jane Adams." The real estate of the testator proved to be vested in a trustee, and his widow was not therefore dowable of any part of it. The question was, whether the widow was entitled to any interest under the will, as manifesting an intention of the testator that she should have so much as she would have been entitled to if the trust had not interposed. The Vice-Chancellor said, that it was an extremely hard case upon the widow; but the Court had no power to make a provision for her which the testator had not made. The question which the Court had to determine was whether anything was given to the widow, and that must be found either by express words or by implication. If a testator recited in his will that he had given a party a legacy, and it did not appear upon the will that any legacy was actually given, the Court was in the habit of looking upon the recital of the gift as sufficiently expressing the intention and amounting to an actual gift. If, on the other hand, the recital was that the party had already some interest in the property independent of any gift from the Testator, it could not be said that by such a recital a gift was intended; for the very expressions used would show that the testator must have thought there was no necessity for his entertaining any such an intention. The gift to the trustees was to be subject to the dower of the wife, and it was probable that the testator intended that his widow should not be without some provision; but suppose it had been subject to some debt or charge which the testator thought he owed, or that a stranger was entitled to, and it proved there was no such debt or charge, it plainly could not then be said that he intended to give to the stranger that which he had devised his estate under the impression that it was subject to. The Court could not look to the degree of relationship which existed, and by that means endeavour to spell, from the circumstances, an intention to confer a benefit which the testator might or might not have entertained. It was said at the bar, that the children were nearly of age, and were desirous that the widow should not be unprovided for; they might therefore have it in their power to make an arrangement, by which any intention the testator might have had in favour of his widow would not be defeated. The Court could not hold that she took any interest under the words of the will.

ROLLS COURT.—*De Feucheres* v. *Dawes.*—In this case a bill was filed by Julien Victor Baron de Feucheres against the alleged next of kin of his late wife, who was a subject of Great Britain. The plaintiff, in consequence of his having survived his wife, claimed to be entitled to such part of her property as she had brought into settlement, or such as had been substituted in its place. The settlement was made in France, according to the French form, but she died domiciled in England. The defendant, however, denied that the Baron de Feucheres had any claim to the property, and alleged that he had been legally divorced in France *du corps* and *des biens.* A suit, however, had been instituted in the ecclesiastical court respecting the right to administration; and as the property was outstanding in the hands of third parties, this suit had been instituted to obtain a receiver pending the proceedings in the ecclesiastical court, and further asking that, upon the appointment of an administrator, the rights of all parties might be ascertained and the property administered in this court. To the latter part of the prayer the defendant put in a demurrer, in support of which it was insisted that the question would be determined in the ecclesiastical court when the court decided to whom of right administration ought to be granted. Lord Langdale said that the bill was filed with two objects: the first was to have the property protected during the litigation which was pending in the ecclesiastical court—that was not objected to by the defendant; but the second object was to have the rights of the parties determined after a personal representative had been appointed. If the fate of the demurrer depended on the question whether the right to the property could be determined by the adjudication in the ecclesiastical court, on the right to the representation, it could not succeed; but it could not depend upon that question. It did not appear who was the administrator; and in the absence of any information whether the administrator, when appointed, would refuse to administer the property in perfect conformity with the rights of the parties interested, the demurrer must be allowed. It also might eventually be necessary to have all the evidence taken in this court, and facts adjudicated upon; but at present the necessity did not appear.

COURT OF QUEEN'S BENCH.—*The Queen* v. *Aimes.*—This was an indictment against the defendant, a gentleman of fortune in Dorsetshire, for stopping up a pathway, which was alleged to be a public pathway, and which led through his park, situated in the neighbourhood of Lyme Regis. The case was tried some time since at the assizes for Dorsetshire, and the jury returned a verdict for the prosecution. A rule had afterwards been obtained to set aside the verdict, and have a new trial; and this rule had been made absolute. An application had since been made to the court to give some directions as to costs. The Court decided that the rule was to be made absolute on the payment of costs.

The Queen v. *the Churchwardens of St. Martin's-in-the-Fields.*—Lord Denman delivered judgment in this case. The churchwardens and overseers of this parish had, under the provisions of the local act which regulated the rating of the parish, imposed a rate upon a private box at Covent-garden, which Miss Burdett Coutts held under a lease originally granted to the late Mr. Coutts. The question depended on the meaning of the word "tenement," which was used in the act; and the Court was of opinion that this word, as there employed, would apply to a private box at the theatre, and the judgment must therefore be in support of the rate.

COURT OF STANNARIES OF CORNWALL.—[Before Prince Albert (the Lord Warden), Lord Langdale, Lord Brougham, Sir J. Wigram, and Baron Parke.]—*Thomas* v. *Vice and Bennetts.*—On Monday his Royal Highness attended at the above court, which was held in the Council-room, at the Duchy of Cornwall-Office, Somerset House, and proceeded to deliver judgment in the above cause, which had been deferred from the 24th ult. His Royal Highness was attired in green Genoa velvet robes, lined with crimson satin, trimmed with ermine, with a deep collar of the same material. His hat was of crimson velvet, turned up with ermine. The Court was greatly crowded. The case was an appeal by the defendants from a decision of the Vice-Warden of the Stannaries Court in Cornwall. His Royal Highness read the judgment, which was to this effect: That the plaintiff's original petition was in the nature of a bill of equity, on which the judges had given an opinion, in accordance with which would be his (Prince Albert's) judgment. His Royal Highness having read the petition and demurrer, argued in 1838, proceeded to say, that the plaintiff had no ground for an application to a court of equity; for, whether it regarded the restoration of possession, or of the ore unsold, or an account of the ore disposed of were required, the remedy must be sought in a court of law. No distinction could be drawn because the claim was for the produce of mines. The Vice-Warden had decided that a court of equity had concurrent jurisdiction with a court of law, which was contrary to the principles of equity. He had, however, relied upon precedents in his the Vice Warden's court, but which were not so numerous as to decide the question. His Royal Highness concluded by saying, "I think no such jurisdiction exists; and my judgment is, that the Vice-Warden's decree be reversed, and the demurrer in the court below allowed."

POLICE.—On Thursday, at the Magistrates' Court, Queen Square, two gardeners, named Henry Bayes and Benjamin Haggerstone, in the employ of Mr. Dennis, an extensive florist, carrying on business in the King's road, Chelsea, were re-examined, charged with having robbed their employer of a number of valuable geraniums and other plants. The principal feature in the case was the improper behaviour of two beer-shop keepers, who, knowing that the prisoners were in Mr. Dennis's employ, had received the stolen property. Mr. Dennis, on Sunday last, missed some handsome stock plants, which were not intended for sale, and, on inquiry, it was ascertained that a geranium, value 10s., had been sold to a man named Davis, the proprietor of the Pine Apple beer-shop, King's-road, by prisoner Bayes, and that Haggerstone had left two jessamines there. On proceeding to another beer-shop in the same neighbourhood, kept by a man named Freeman, some other geraniums were found. On the former examination, Davis said he was sure in his mind that Bayes had not stolen the geraniums. He was sure he did not know anything about the jessamines, as his wife took them in. The other beer-shop keeper, Freeman, appeared equally desirous of screening the prisoners, and could not say in any way how the plants got into his possession. He said he went to bed one night, and they were not there, and the next morning when he got up they were. Some geraniums had been broken by some parties, and he supposed they were brought there in their stead. A policeman stated that since the last examination he had found some of the geraniums at a baker's in the Fulham-road. He asked them how they got them, and was informed they had given Davis, the beer shopkeeper, four shillings for them. Davis came into the shop the moment after, and in the presence of the baker and his wife admitted that he had bought them of the man Bayes then in custody. Davis was questioned on the subject, and declared he had bought the four plants produced in Covent Garden Market and not of Bayes, as he had before stated. Prisoners declared they knew nothing about the plants. But evidence having been given that they had already admitted haying taking the ten 10s. geranium and jessamines, they were remanded to give time for the attendance of a necessary witness.

SPORTING.

TATTERSALLS, THURSDAY.—There have been several defalcations in the settlement on the late Derby; one party is said to have failed to the amount of 18,000*l.*, and the absentees and unpaid balances have been numerous. The following bets were laid in the course of the afternoon:—

ASCOT CUP.

Even on Mr. Ramsay's Lanercost (laid to about 500*l.*)
5 to 2 agst Mr. Orde's Beeswing (laid to about 100*l.*)
5 to 1 —— Mr. Combe's The Nob
7 to 1 —— Sir G. Heathcote's Bokhara (300 to 50 laid once)

ST. LEGER.

2 to 1 agst Col. Anson's Attila (taken)
9 to 1 —— Mr. Ramsay's Cabrera
17 to 1 —— Mr. Bowes's Meteor (20 to 1 laid once).

Entry for the Queen's Vase at Ascot:—Beeswing, Pannakeen, Bosphorus, Albion, Jack, St. Francis, Eringo, Adela filly, Yorkshire Lady, Eaglesfield, The Nob, Rosalind, Muley Hamet.

MARK LANE, FRIDAY, JUNE 3.—Since Monday the supply of Wheat from Essex and Suffolk has been moderate, yet that day's currency was with difficulty maintained. The free Foreign is a very slow sale, but the same prices are demanded. The fine weather has produced a flatness in the trade for bonded, and there has been about 3700 qrs. entered for consumption in London during the week.—Barley, Peas, and Beans are unaltered in value, but Oats are in demand at 1s. advance, in consequence of indifferent accounts from Ireland.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MEMBERS of the ROYAL AGRICULTURAL SOCIETY of ENGLAND who expect to be able to attend the Meeting of the Society at Bristol in July next, are requested by the Local Committee of that place to transmit their names to Mr. JAMES MARMONT, 15, Corn-street, Bristol, in order to aid the arrangements which the Local Committee are making for the commodious reception and comfort of the Members at the ensuing Meeting.

JAMES HUDSON, Secretary.

London, May 27, 1842.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT BRISTOL.

THE SOCIETY'S SHOW of CATTLE, IMPLEMENTS, &c., will take place on Thursday, the 14th of July next, and all persons intending to exhibit Stock, Implements, or other articles, are requested to observe that all CERTIFICATES or ENTRIES must be sent to or lodged with the Secretary, at the Society's house, No. 12, Hanover-square, London, on or before Tuesday, the 14th of June, and that no entries will be admitted after that day. A bill of the Prizes offered, and the printed Forms of Certificate, &c., can also be obtained by applying to the Secretary, at the above address—it being particularly requested that all parties making such application will specify the kind of Stock, &c., which he intends to enter, in order that the proper Certificate Forms may be sent accordingly.

By order of the Council, JAMES HUDSON,
London, May 11, 1842. Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND are desirous of receiving TENDERS from Innkeepers, Confectioners, and others to contract for any one or all of the three following supplies, to be furnished at the Society's Annual Country Meeting, to be held at Bristol in the ensuing Month:—

1st. A COLD DINNER for 2,400 persons, with a Pint of Port or Sherry to each, on Thursday, the 14th of July.

2d. Suitable REFRESHMENTS for 300 Ladies, in the Gallery of the Great Dining Pavilion, on the same occasion.

3d. A HOT DINNER for 600 persons, with Dessert and a Bottle of Wine to each, in the Victoria Rooms, Bristol, on Wednesday, the 13th of July.

Further particulars may be obtained by applying to Mr. MARMONT, 15, Corn-street, Bristol; or to the Secretary of the Society, 12, Hanover-square, London, to the latter of whom the Tenders must be sent in on or before Tuesday, the 21st of the present Month, the Society not binding themselves to accept the lowest Tender.

By order of the Council, JAMES HUDSON,
London, June 1st, 1842. Secretary.

NOTICE TO EXHIBITORS.

A SELECT FLOWER SHOW will take place on Tuesday, the 21st of June, in the Grounds of the Royal Beulah Spa, Norwood. The following prizes will be awarded on the occasion:—

	1st.	2d.	3d.

To Nurserymen and Dealers, for best Collection of Miscellaneous Plants . . .	40	0	30	0	20	0	10	0				

REGULATIONS FOR EXHIBITING.

The subjects of Exhibition will be divided into three classes:—For the first class, any one may compete,—for the second class, Amateurs and Gardeners may compete,—and for the third class, Nurserymen only are to compete.—*Productions may be exhibited from any part of the kingdom*, either for sale or competition, free of any charge; and each Exhibitor will be allowed one ticket, admitting him at six o'clock.—Specimens for exhibition or competition, forwarded from the country, addressed to the Secretary, with instructions, will be duly attended to; and he will see that they are properly staged, without charge, and returned to the contributor.—Exhibitors of flowers in pans will be required to label them with their proper names.—As very fine specimens are often produced, in particular situations and seasons, premiums will be awarded to such specimens, if they are worthy, though not mentioned in the schedule.—All specimens exhibited for competition shall have been in possession of the Exhibitor at least two months prior to the day of exhibition.—No one person will be allowed to win two prizes with the same variety, in the same class.—No prizes will be awarded for Fruits and Vegetables, unless fit for the table.—Specimens intended for exhibition must be at the gardens, and a list given to the Secretary, containing the names of the Plants, Flowers, Fruits, and Vegetables, not later than nine o'clock; and all productions must be placed in the several classes, and all labelled with their proper names, not later than eleven o'clock: after which time none will be allowed to be staged. The specimens must remain staged until seven o'clock, when they will be delivered to the Exhibitors.—Any deviations from these rules will lead to the productions being treated as if not present.—If any difference of opinion should arise between the judges, an umpire shall be appointed by the Council, whose decision shall be final.—Judges will be selected at the time of the meeting; and they will be requested to pay no attention to the number or value of the prizes they award, so that the specimens be better than usually grown; and they will be particularly requested to give their attention to the growth and habits of the plants, and not to make any award when specimens do not appear worthy; the principal object of the Council being to reward the success of the skilful gardener, and to promote more extensively a knowledge of the practice and theory of gardening.—There will be other Exhibitions in the course of the season, of which due notice will be given.

S. E. COTTAM, Secretary.

BROMLEY HORTICULTURAL SOCIETY.—The Second Exhibition for this Season will take place in the Grounds of the White Hart Hotel, Bromley, Kent, on Saturday, the 18th inst. Admittance (for the Subscribers and their friends) at Two o'clock.

BRISTOL AND CLIFTON GRAND DAHLIA SHOW.—The above Show will take place on Monday, September 5th, when the following number of Prizes will be given:—

Nurserymen; open to all England; the best 24 dissimilar blooms; 3 Prizes.

Amateurs; open to all England; the best 12 dissimilar blooms; 3 Prizes.

Amateurs living within 4 Miles of Bristol; 9 dissimilar blooms; 4 Prizes.

Subscription to each Class 10*s*. No Exhibitor will be allowed to take more than One Prize in each Class.

Further Particulars may be known on application to GEORGE MEATYARD, Hon. Sec., Full Moon Tavern, Broad-st., Bristol.

June 7th, 1842.

ARAUCARIA IMBRICATA.—W. SKIRVING, WALTON NURSERY, LIVERPOOL, begs leave to offer to the Public his extensive Stock of this interesting hardy Tree, at the following Prices, viz.—

2 years' old from Seed	. . .	5*s*. each.
3 ,, ,,	. . .	10*s*. 6*d*.
4 ,, ,,	. . .	21*s*.

W. S. also offers fine Plants of Araucaria Braziliensis, 2½ feet high, at 42*s*. each; and some very fine specimens of that most beautiful of all trees, the Araucaria excelsa, five to six feet high, at Ten Guineas each. The above Plants are all in pots, and can be sent safely to any part of this Kingdom, or the Continent.

ARAUCARIA IMBRICATA.

MESSRS. W. and F. YOUELL beg respectfully to inform the Nobility and Gentry who are desirous of enriching their Arboretums and Plantations with this truly ornamental and hardy tree, that they are offering fine strong Plants, 2 years old, from seed, in pots, at 5*s*. per plant, 60*s*. per dozen, or 20*l*. per 100, which they will warrant perfectly hardy, having had several hundred standing fully exposed to the severity of the late winter, without receiving the slightest detriment, in a situation completely open to the north-easterly gales, and within 500 yards of the wash of the sea.

Those who are unacquainted with the habit and description of the above can obtain an engraving, taken from a plant in the Arboretum of the Earl of Orford, together with a description, by enclosing 4 postage stamps. To be obtained also of their Agents, Messrs. Flanagan and Co., 9, Mansion House-street; and of Messrs. Noble, 152, Fleet-street, London.

CEDRUS DEODARA.

Fine Plants of this elegant and ornamental hardy tree may also be obtained of Messrs. W. and F. Y., at the following prices:

3 years old, from seed,	9 to 11 inches,	84*s*.	per dozen.
2 ,, ,,	5 to 7 ,,	63*s*.	,,

Great Yarmouth Nursery, Norfolk, May 19, 1842.

ROSES.

T. RIVERS, Junr., respectfully informs his Friends that his Collection will be in full blow from the 18th or 20th inst. The Collection is of much greater extent, and, he flatters himself, will prove this season more interesting than any previous.

Trains per Northern and Eastern Railway run from London at the following hours, stopping at Harlow and Sawbridgeworth Stations alternately, both of which are equidistant from the Nursery, viz., one mile:—Morning, 8 o'clock, ½ past 9, ½ past 11; Afternoon, ½ past 1, ½ past 3, ½ past 4, and 8 o'clock.

Sawbridgeworth, June 9th.

ROSES.

MESSRS. PAUL & SON, Florists, &c., Cheshunt, Herts., having been requested by many admirers of the ROSE to give notice when their Collection would be in the greatest perfection of bloom, have the pleasure of announcing the PRESENT TIME, and flatter themselves, that whoever visits their grounds will be highly gratified.

To the numerous company who honoured them with a visit last season they beg to intimate, that their Collection this season will prove doubly interesting in consequence of the numerous additions of new and fine Roses received from abroad.

Cheshunt is only 13 miles from London, situated on the high road from London to Hertford and Ware, being a delightful carriage-drive from the West End, either through the green lanes and Theobald's Park, or through Tottenham and Waltham Cross.

The Northern and Eastern Railway also affords a cheap and expeditious method of reaching the Nurseries, trains running from London to Waltham Cross in the short space of half an hour, from whence a coach runs to the Nurseries in ten minutes.

N.B.—The trains run from the station, High-street, Shoreditch, eight times daily, and return eight times, all stopping at the Waltham Cross Station.

Cheshunt Nurseries, June 11, 1842.

NURSERY GROUNDS, GREAT BERKHAMPSTEAD, HERTS.

H. LANE and SON respectfully beg to announce to the Nobility and Gentry, admirers of Floriculture, that their collection of ROSES, comprising almost every known variety, will be in FULL BLOOM on or about the 20th of JUNE inst., and for richness of colour and exquisite fragrance will equal, if not surpass, anything of the kind ever produced in this Kingdom.

H. L. and SON'S extensive collection of named Heart's-ease and splendid Seedlings are now in their most gaudy attire.

Berkhampstead is 28 Miles from Euston-square, from whence a Train (stopping at the Berkhampstead Station) leaves at the hours of 7 and 8, A.M., and Half past 1, 3, and 6, P.M., respectively returning at 54 minutes past 7, 9 minutes past 9, 16 minutes past 11, and 39 minutes past 11, A.M., and 25 minutes past 4, and 22 minutes past 8, P.M. Performing the distance each way in an hour and twenty minutes. The first trains in the morning, and the last at night, are 3d Class, the Fare by which is only 3*s*. 6*d*.

TO THE AMATEURS OF ROSES.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WILLIAM WOOD and SON have the honour to announce to their Friends and the Floricultural Public in general, that their unrivalled and most extensive collection of ROSES, consisting of many thousands, both Standards and Dwarfs, cultivated on upwards of 14 Acres, and comprising every variety known that is worthy of cultivation, are now in splendid bloom, and will continue flowering until the end of the Rose season.

W. W. and SON beg to state that their collection is not surpassed by any other in Europe.

Coaches to Lewes daily from the Golden Cross, Charing-Cross, passing through Maresfield.

Woodlands, June 10th.

LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, Album, and Punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

TO NURSERYMEN AND FLORISTS.

JAMES PAMPLIN, NURSERYMAN, Walthamstow, Essex, begs to acquaint Nurserymen and Amateurs that his SPLENDID PELARGONIUMS, which have been so much and justly admired, viz.—Enchantress, Camilla, Van Amburgh, Anna, Alice Grey, &c. &c. &c.; together with many New and Splendid Seedlings not yet in the possession of any other person, are now in Bloom, and may be seen at his Nursery.

Walthamstow, June 9th, 1842.

NEW AND DISTINCT FUCHSIAS.

MESSRS. YOUELL continue sending out their splendid Collection of the above by post, free, and without the slightest risk of injury, to any part of the United Kingdom. For particulars, see their advertisement in the *Gardeners' Chronicle* of the 21st of May.

Messrs. Y. have just published a new Catalogue, with prices, of their Collection of the above beautiful tribe, containing upwards of 60 superb varieties, including all those sent out by various parties this season; it can be obtained of them by enclosing a postage stamp.

They beg to call the attention of those residing at a great distance, to the advantages of their mode of executing orders for these Plants, as it not only avoids the expense of packing, carriage, &c., but secures the greatest despatch.

Great Yarmouth Nursery, June 9th, 1842.

WILLIAM MAY begs to announce that he is now sending out his SIX NEW FUCHSIAS for 30*s*., and his SIX NEW CALCEOLARIAS for 42*s*. "Lady Constable" Calceolaria, if separate, at 21*s*. each; this plant will be sent post free. He has also a few collections of his splendid SPANISH CHRYSANTHEMUMS left. Descriptive Lists may be had on application.—Hope Nursery, Leeming-lane, near Bedale, Yorkshire, June 10th, 1842.

CHEAP SHOWY PLANTS FOR FLOWER-BEDS.

WILLIAM BARRATT begs to offer to Floriculturists, as below, CALCEOLARIAS, GERANIUMS, VERBENAS, FUCHSIAS, PANSIES, DAHLIAS, and other free-blooming Garden Flowers, at 4*s*. to 6*s*. per dozen; strong Plants ready for planting out. A fine collection of the above plants in named sorts, as well as other Greenhouse and Herbaceous plants for Rooms and Greenhouses.

About 10,000 GREENHOUSE HEATHS and EPACRISES, in fine health; worthy the attention of the Amateur and Nurseryman.

*** NATURAL GRASSES for permanent pasture, in selected sorts. Persons ordering these should give the quantity of ground, the situation and quality of the soil, and for what purpose wanted; doing this they may rely on having the proper kinds, and at not above one-third more expense than the old mixtures of Hay-seeds, which are very uncertain in producing good Herbage. Also, DWARF LAWN GRASSES; as much seed as will sow 100 square yards for from 3*s*. to 4*s*.

Wakefield Nursery, May 1842.

BARNSBURY NURSERY.—Messrs. PROTHEROE and MORRIS are instructed to offer to Public competition, on the Premises, Thornhill Road, Barnsbury Park, Islington, on Monday, June 13, 1842, and following day, at 11 o'clock (if not previously disposed of by private contract), the desirable LEASEHOLD NURSERY; also the whole of the choice GREENHOUSE PLANTS, consisting of the newest varieties of Geraniums, Heaths, Camellias, Calceolarias, Fuchsias, Clematis Seboldii, Daphne, Heliotropes, Verbenas, Salvias, &c. Four newly-erected Greenhouses; several Pits, Frames, Hand-lights, Utensils in Trade, &c.

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l*. for whole term of Life.

Age.	Annual Premium payable during				
	1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.

PETER MORRISON, Resident Director.

A liberal commission allowed to Solicitors and Agents.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hot-houses, Conservatories, and Private Houses, by means of Hot-water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted-up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and dispatch.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

FLOWER PROPS, of Wrought Iron, made upon an approved principle, in lengths of 2 ft. to 8 ft. Also, Garden Engines, Greenhouse Syringes, improved Watering Pots, Fumigating Bellows, Grass and Border Shears, Pruning Knives and Shears, and all other Horticultural Implements, upon the most advantageous terms, at Trudell and Edwards's, Wholesale and Retail Ironmongers, 46, Leadenhall-street, London.

GARDEN SEATS, FLOWER STANDS, WIRE WORK, GREENHOUSES, &c.

J. CRIPPS, No. 11, MARKHAM PLACE, KING'S ROAD, CHELSEA, Wire Worker by special appointment to her Majesty Queen Victoria, the Dowager Queen Adelaide, and her Royal Highness the Duchess of Kent, begs respectfully to inform the Nobility and Gentry that he has at present on hand, the largest stock in London of Rustic and other Garden Seats, Chairs, Stools, Tables, Flower Stands, Mignonette and Plant Boxes, Wire Work of every description, as Arches for walks, Flower Bordering, Trainers for plants, &c. &c. J. C. also constructs Forcing Houses, Conservatories, Greenhouses, Verandahs, Alcoves, and Summer Seats, Invisible and Hare-proof Fences, Gates, &c.; in short, almost every decorative appendage to the Rural Residence.

Plans and Estimates submitted for works in contemplation. Blinds of every description made, repaired, altered, or painted.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*, with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering-pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

*** NUTT ON BEES (5th edition) now published.

WANTED as FOREMAN, a Steady, Active, Young Man, who has a general knowledge of Plants, and understands the Management of Vines and Kitchen Gardening.—Apply personally to J. G. Bruce, Florist, Upper Ham-road, Kingston, Surrey.

WANTED, in a Small Respectable Family, a Man and his Wife, (without incumbrance,) as GARDENER and COOK, to reside in the House. The Man will be required to Brew, and to Milk occasionally. The Wife, in addition to being a good plain Cook, will be required to Bake, and to take charge of a small Dairy.—Apply by letter (post free) to F. H. S., *Gardeners' Chronicle* Office, Charles-street, Covent-garden.

AS GARDENER.—A gentleman wishes to procure a SITUATION for an active young man as GARDENER, aged 26, who has lived with him in that capacity for upwards of two years, and whom he can strongly recommend for honesty, sobriety, and good principles. He understands hothouses, greenhouses, kitchen and flower garden, and the management of stock. Direct to W. H., Messrs. Burrup and Slight's, 36, Lombard-street.

WANTS a SITUATION as GARDENER, a Person aged about 50 years, who is thoroughly acquainted with his profession, in which he has been very successful; he is a first-rate grower of Plants, Forced Fruits, &c., as well as a general Gardener, and is well versed with Ornamental and Forest Planting. He is a married Man, with Two Children. Terms 75*l*. a-year, with House, Coals, &c. found.—Address W. B. G., Post-office, Northallerton, Yorkshire.

WANTS a SITUATION as UNDER GARDENER, a Young Man, 20 years of age, who has been 5 years in one of the most respectable London Nurseries, and who is well acquainted with Greenhouse Plants; his present object is to improve himself in the Forcing Department under the tuition of a respectable Gardener.

Direct, stating particulars, F. F., at Mr. Halley's Nursery, Blackheath.

WANTS a SITUATION as GARDENER, a Middle-aged Man, who understands his business in all its branches. Can have a six years' character.—Apply at Mr. Gregory's Nursery, Cirencester;—Messrs. Maule, Bristol; or to A. B., Post-office, Shirehampton.

WANTS a SITUATION as GARDENER, a Married Man, 32 years of age, who perfectly understands the Management of Pines, Vines, Stove and Greenhouse Plants, and Flower Garden. Can be well recommended.—Apply to Mr. Pressley, Gardener to Robert Boyd, Esq., Plaistow Lodge, Bromley, Kent.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK, Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

SION NURSERY, near Beulah Spa.—TO BE LET or SOLD, a Dwelling-House, Six Acres of Garden Ground, excellent Hothouse and Greenhouses, &c.—Apply to Mr. Flight, 1, Adam-street, Adelphi.

DESTRUCTIVE ANIMALCULÆ.—As Spring approaches, the larvæ of DESTRUCTIVE INSECTS are propagated in infinite multitudes, and impregnate with millions of insects the very air we breathe. J. READ begs to inform every person interested in the practice of Horticulture, that he has made considerable improvements in his ENGINES and MACHINES for the purpose of destroying those Animalculæ which make such deadly havoc on all choice Fruit-trees and Plants at this season of the year. The above are fitted with tubes that will bear any degree of pressure required, and are water, air, and steam proof. From 31 years' practice in Horticulture, and 21 years in Manufacturing and Improving Engines, J. R. can warrant them the best adapted for the above purposes of any hitherto made; the valves being solid spherical metal are never liable to be out of repair, even in the hottest climates.

Manufactured only by the Patentee, 35, Regent Circus, Piccadilly, where they may be seen and proved.

N.B.—None are genuine except stamped with the words, "Read's Patent."

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.

Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.

The Number for June, 1842, contains highly-finished drawings of *Epidendrum phœniceum*, *Fuchsia cordifolia*, *Lobelia heterophylla* var. *Major*, and *Clerodendron splendens*: likewise Papers on Gardening as a science; Advantages of removing decaying Flowers; Tender Climbers for Summer Purposes; Floricultural Notices of new or beautiful Plants figured in the leading Botanical Periodicals for May, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies required.

MEETINGS IN THE ENSUING WEEK.
Tuesday . . . . . Zoological . . . . . 8½ P. M.
Wednesday . . . . Geological . . . . . . 8½ P. M.
COUNTRY SHOWS.—June 15, Royal Berkshire. 16, Croydon.

WE rarely express an opinion upon matters of mere taste, because we much mistrust our judgment in such questions. We find the arbiters of elegance approving of such buildings as the National Gallery, such monuments as the Duke of York's column, such sculpture as Mr. Wyatt's, such singing as Miss Kemble's, such painting as Mr. Turner's; and as most people seem agreed in discovering, in all these things, some great merit which escapes our observation, we cannot but suppose ourselves wrong, and the world of fashion right; and, therefore, we conclude that points of taste are not in our vocation.

Nevertheless, we will venture to hint, with all diffidence, to the proper authorities, whomsoever they may be, that the object, intended we presume for a fountain, just placed in the lake in St. James's Park, at the end next Buckingham Palace, had better be looked at again before it is allowed to take its station permanently in the only public place in London having pretensions to natural beauty. Fountains are certainly among the most beautiful of all the architectural decorations of a garden. They resemble the most surprising exhibitions of nature; for natural *jets d'eau*, though rare, do exist, and must always be regarded as very remarkable phenomena. "Such exhibitions, when imitable," says Sir Uvedale Price, "are surely proper objects of imitation; and as art cannot pretend to vie with nature in greatness of style and execution, she must try to compensate her weakness by symmetry, variety, and richness of design; and fountains, such as are still to be seen in Rome and its environs, may be classed with the most striking specimens of art, in point of richness and brilliancy of effect." But it is only when these principles are observed that fountains are decorations: if they are upon a small scale—that is to say, on a scale small in comparison with the objects that surround them—they cease to be representations of surprising phenomena; and if, instead of "symmetry, variety, and richness of design," such objects present a poverty of invention and inelegant proportions, they become extremely offensive to the eye of taste.

We perhaps are wrong, but in our eyes the new fountain in St. James's Park is open to every objection that can be taken to such ornaments. It is ten times too small for the place it stands in; and for beauty of design it can be compared to nothing which we have any recollection of, unless it be that shape described by Milton:

> "If shape it might be called, which shape had none,
> Distinguishable in member, joint, or limb;
> Or substance might be called which shadow seem'd,
> For each seemed either."

How different is this from the fountain painted by Spenser, who so truly describes what should be the attribute of decorations of this sort, that we cannot but quote his words:—

> "And in the midst of all a fountain stood,
> Of richest substance that on earth might be,
> So pure and shining that the silver flood
> Through every channel running one might see;
> Most goodly it with curious imagery
> Was over wrought, and shapes of naked boys,
> Of which some seem'd with lively jollity
> To fly about, playing their wanton toys,
> Whilst others did themselves embay in liquid joys.
>
> "Infinite streams continually did well
> Out of this fountain sweet and fair to see,
> The which into an ample laver fell,
> And shortly grew to such great quantity,
> That like a little lake it seem'd to be;
> Whose depth exceeded not three cubits' height,
> That through the waves one might the bottom see,
> All paved beneath with jasper shining bright,
> That seemed the fountain in that sea did sail upright."

A PLANT cannot feed upon flesh, but it can upon the elements of flesh; it cannot feed on timber, but it can on the elements of timber; nor can it upon straw, although the elements of straw are most grateful to it. In the living state, those elements are held together by the irresistible power of nature, and cannot be dissolved; when dead, they are still held together, but the force which united them is gone, and they are ready to separate; their separation we call decay. The rotting of plants, the putrefaction of dead bodies, are the consequence of the separation of the elements out of which they once were formed, and which are set free again in order that other plants and animals may feed upon them, according to the proportion most suitable to their several constitutions.

Nature, prodigal of resources, and inexhaustible of materials, permits such elements to escape whither they will, for that which is lost in one place is gained in another. But in his artificial state, man is essentially selfish, and is constrained to consider how he best can monopolise the riches that surround him. It is nothing to him to know that the matter which his garden is losing every hour is gained by other gardens, or by fields or farms in another quarter of the globe; it is his interest to himself, and his duty to his country, to secure at home all that he can of the wealth which the soil affords. There are many farmers as well as gardeners who would be much surprised at being congratulated upon their disinterestedness in subscribing a large part of their substance for the maintenance of birds and wild animals, of ditches and rivers, and all the loathsome tribes that wallow and burrow in their mud; they would be unconscious enough of meriting the compliment. We must, nevertheless, take leave to tell them very seriously that in this folly they practically assist during every day of their lives.

We will beg them to read again the short observations upon manures which were made in this paper a fortnight since (p. 347), and then to ask themselves how much of the means which they possess of fertilising their soil is utterly wasted. Perhaps the question may meet with no reply; possibly, they may be of opinion that it is not wasted at all. We will answer it for them.

Farmyard manure is composed of straw and certain fluid or easily soluble substances. The latter consist of saline matters and ammonia, and the fertilising effect of manure is in the first instance owing to them; the former can produce no action as a manure until it is thoroughly decayed, when it supplies flint in a dissolvable condition, and the ordinary black mould that all soil abounds in. That these two parts of farmyard manure have a very different effect is easily proved by dressing land with dry straw in one place, and fresh stable litter in another. We need not say how much superior the second is to the first; and yet the difference between them is only that one consists of dry straw alone, and the other of dry straw and something else. That "something else" is, then, what produces the difference in favour of stable litter. And what is the "something else," except the saline matters and ammonia above spoken of, in the form of a fluid or half-fluid substance? Then these are the part of farmyard manure which it is most important to preserve; about that no doubt can possibly be entertained.

Let us now ask our agricultural friends whether they do take care to preserve the saline matters and ammonia which form the valuable part of their manure, and to which they must look for good crops, far more than to the straw that forms the bulk of it. They may say—yes; but we say, no. For what do they do? In the first place, the litter mixed with this valuable fluid matter is exposed to rain, which washes it down, and carries away all the dissolvable parts; then drains are cut, or contrivances made, not to catch the fluid as it flows away, but to direct it to the horse-pond, or to the ditches, or, in short, to any place where *it can be got rid of*.

And this is not all. The ammonia, which is so greatly needed, all flies away; the heat of the manure when thrown in heaps, drives it off, in the form of a pungent vapour, which we smell but see not. In time, when the manure is thoroughly rotted, the ammonia is all gone, and with it the strength of the substance. This may be easily proved: hold a rag dipped in muriatic acid over a fresh dunghill, and white fumes will be formed around the rag by the ammonia that comes in contact with it. Try the same experiment with an old dunghill, and no fumes will be formed, because the ammonia has all flown away, the farmer having made a present of it to his neighbours.

In this way the best part of the manure is incessantly lost to a farm. Then when the residue, remaining in a heap, and turned to black mould, is found not to produce so good a crop as is required, the farmer buys nitrate of soda, and guano, and urates, and aimatic compost, and all sorts of "fertilisers," which after all contain nothing more than the equivalent of what he had already been washing out of his manure and turning to waste.

Surely it is very bad management this, and of a kind for which there is no excuse; because it costs no more to economise materials than to waste them, nor indeed anything like so much.

A little calculation will serve to show the effect of this sort of improvidence. We will suppose a farmer to have ten horses, oxen, or other stock, continually in his yard. Each animal may be estimated to produce 2,000 lbs. of fluid annually, which if dried would, according to the computation of agricultural chemists, weigh 136 lbs.; we will suppose that the farmer wastes of this only 100 lbs., and that 36 lbs. are really saved by one means or another. The total amount of waste then would be 1,000 lbs. of dry, fertilising material of the most valuable description. Now 400 lbs. of this material are reckoned equal to 5 tons of common farm-yard manure; and therefore the whole quantity lost is equal to 12 tons and a half; so that a ton and a quarter of farm-yard manure is lost for every head of stock. But in reality the loss is much more considerable.

Let it not be inferred from what has now been stated that the use of liquid manure is indispensable. That is a separate question, to which we shall next address ourselves.

THE construction of garden-walks so nearly concerns the comforts of us all, that a few words upon the subject just now, when one kind at least can be best executed, will not, we trust, be ill-timed. It may be assumed that the formation of walks with gravel, or similar materials, is familiar to all men, and that little requires to be said on that subject. It is not every one, however, who is in the neighbourhood of good binding gravel; and even when that is the case, gravel is not the best material to employ for all purposes—for it will neither keep down worms, nor resist the wearing of feet where there is much traffic; and moreover, it forms a bed in which weeds root greedily, unless means are taken to destroy them as they appear.

What we are about to recommend for introduction where gravel is objectionable or unprocurable, is a kind of cheap asphalte, which any one may make for himself, where coal-tar can be procured. In consequence of having been much struck by the neatness and excellence of some walks thus prepared, a floor for greenhouse plants to stand on out of doors during summer has been constructed in a similar matter in the Garden of the Horticultural Society; and at so small a cost, that we can strongly recommend the adoption of the method.

In order to form a flooring or walk in this manner, the following directions must be attended to: Procure a quantity of road-sand, or similar powdery material—finely-sifted lime-rubbish will do—and let it be thoroughly dried, so that it feels like dust when handled. Also sift out of the cinders from the dwelling-house, or the stoke-holes, the finer parts, and let that too be made perfectly dry. Then mix these materials carefully in the proportion of two parts of road-sand to one part of cinder-siftings.

Next provide an iron cauldron in which coal-tar can be made boiling hot. In a dry place, on a dry day, spread a quantity of the sand and cinder ashes on the ground, as a bricklayer spreads his lime, making it hollow in the middle; and into that hollow pour the hot tar. Then, with a shovel, incorporate the whole as in the operation of making mortar; and when a stiff paste has been thus formed, spread it over the ground where the walk or flooring is to be constructed. In order to receive it, the ground should have been previously beaten or trodden down as firm and as level as it is possible.

The asphalte mortar, for this is a kind of coarse asphalte, may be spread with a spade to the thickness of three or four inches, then powdered all over with dry and rather coarse sand: after which, a few passages of the roller will press it level, and the work is done. The final addition of dry sand is to give the asphalte a face, and to prevent its sticking to the roller. The work may then be left for a few days to harden, after which it is fit for use. If it afterwards should ooze out here and there, in consequence of imperfect consolidation, a little dry sand dusted on such places prevents them from enlarging.

The chief cause by which this material is likely to be rendered perishable is the use of the road-sand and cinder-siftings in a damp state. It is indispensable that they should be as dry as dust is in a hot summer, otherwise the tar and the sand will not adhere, and then the work will come to pieces. It is also requisite that the materials should be thoroughly worked together, so that no loose sand remains in the mass.

The quantity of coal-tar to be employed is not very important; as much as will render the whole mass like stiff mortar, after the materials have been thoroughly worked together, will be the proper quantity. It is of no use to make it thinner; and as that could only be done by using an excess of coal-tar, the only part of the materials that costs money, it is of course the more to be avoided.

Walks or floorings so prepared will last for very many years.

IN another column will be found some observations upon the proposed alterations connected with the old Kitchen-gardens at Kensington. As they come from a gentleman of the highest respectability, we cannot but give them insertion. Our own opinion upon the subject will be seen by referring to p. 627 of the *Chronicle* for last year.

IT may be in the recollection of some of our readers that the Affghan Clover and Lucern, of which seeds were received from India a year or two ago, appeared, from a few experiments, to be well deserving of cultivation in this country. In pursuance of that admirable system which is acted upon at the India House, of endeavouring in every possible way to render the productions of Great Britain and India mutually advantageous, the Court of Directors sent out immediate orders for a further supply of both these seeds. The Clover Sir Al. Burnes had promised to send, but the despatch probably never left Cabul, or, at least, never reached India. A quantity of Khelat Lucern has, however, been sent home, and is supposed to be the same as the Lucern sent two years ago. This was the same species as what we already have, that is to say, as Medicago sativa, but it was more prolific, and possessed the invaluable property of coming in as green food much earlier in the season than anything known here. This was first ascertained by Mr. Groom, of Walworth, and his evidence has been confirmed by that of others.

We understand that a large quantity of this seed is at the India House, and we have no doubt that gentlemen wishing to try it may obtain a portion by application to the Secretary, or to any of the Directors of the East India Company.

KENSINGTON GARDENS.

As it appears that the public have not closed with the project of disposing of the site of the kitchen-garden at Kensington so readily as was expected, I beg to offer the following remarks on this most objectionable plan, in the hope that, before it be too late, the present Government may be disposed to reconsider the subject.

There are two points on which the planners of this scheme deserve some credit; and as they are the only points, deserving of commendation, candour requires their being noticed: the one is, the making a kitchen-garden at Windsor worthy of the place; the other, the projecting a road to connect Bayswater and Kensington, which will be a considerable public benefit. All the other bearings of the subject I hold to be worse than bad—to be discreditable to those who drew the plan, and even more so to those who adopted instead of repudiating it, as they ought to have done.

To the north and west of Kensington Palace is the ground in question, a strip to the north forming a paddock used by the inmates of the Palace, and a longer strip running quite from the Kensington-gate to the Bayswater-road, forming, in the whole, between 30 and 40 acres. The plan is to let the whole front along the Bayswater-road, including, I believe, part of the paddock, for building sites, and running a wide road down the centre of the old gardens, to divide the ground on each side into blocks of about an acre each, to be let to individuals for 99 years—that is, this invaluable piece of ground is to be jobbed out in the ordinary manner practised by individuals who have a few acres adjoining a watering place, to make the most they can of their land. Is this consistent with the dignity of the Crown of England? Is the raising the beggarly sum, necessary to make the garden at Windsor, to be attained by the alienating for ever (for, disguise it as they may, this is the real truth) of such a piece of ground? Let any one see the manner in which the promenade in Kensington Gardens is attended, and see the plans and extension of buildings on every side, and say whether Government is not called on, as a sacred duty, to do anything rather than, in the manner here intended, to sacrifice even an acre which can be devoted to the public health and amusement? There is a cardinal point which should be carefully attended to in the management of the Parks. No individual should be on any pretence allowed to establish an interest in them. We have just seen a nuisance removed from Piccadilly, and the private residences in the Regent's Park are perhaps the only blots in that beautiful inclosure, whilst the conditions entered into with the possessors are a serious bar to improvement, and the pecuniary return is wholly unworthy notice.

Having now expressed my opinion on the plan, I beg to suggest a better mode of laying out the ground. The road might be carried quite along the west side, leaving all the open space possible. A necessary space of private ground, but fenced with open pallisade, should surround the Palace and leave it isolated; the remainder should be laid out in choice and ornamental shrubbery and flower-garden in a plain way, and properly secured from injury by the public. The paddock I would leave as it is, if an equivalent cannot be found elsewhere; only, instead of the brick walls, open pallisades should be substituted, and a communication made from the N.W. corner of the Kensington Gardens to the S.W. one. If this plan be adopted, the public will have a delightful addition to the Garden, and the inmates of the Palace have the satisfaction of seeing that the ground is devoted to public use and enjoyment, instead of their being annoyed by the smoke and inconvenience of private dwellings which are to close it in, upon the north and west. With respect to the raising the money, has Parliament ever refused a grant for Windsor? We think not; though some grants might have excited observation from their enormous amount in proportion to their objects: the stables and kennels, for instance. If it be deemed necessary or expedient to alienate any portion of the Crown land for the purpose, it should be done at a distance, and not so near the heart of London. A farm in Hampshire or Staffordshire is of no moment, if the full value be obtained for it; whereas, if a site like this be lost, it can never be regained.

There is one more suggestion which may be made: a row of villa houses, contiguous, with a mere open space of a few feet, might be built on the extreme boundary facing the Palace, and opening to the road, but without garden or ground. There is no question that this plan might answer, and would not be very objectionable. A depth of 50 feet would realise some money; though I should prefer having the whole site clear, especially if there are hopes of purchasing ground to the west, which I have heard are entertained.

I must now conclude, earnestly calling on members of Parliament, more especially those connected with the metropolis, to stir themselves, and prevent the Government thus carrying out the provisions of a legacy left them by their predecessors.—*W.*

AMATEUR'S GARDEN.—No. XXIV.

THE amateur, in visiting any of the numerous Horticultural exhibitions, which are now patronized in all parts of the country, will often have been struck with the beauty and singularity of a tribe of plants which are now comparatively common. It is those things, I mean, which are called Air plants or Orchidaceæ, and whose flowers at first sight have, in many instances, a greater resemblance to animals than to plants;—that curious race to which belong those strange species of Orchis, which grow wild in the fields, and which are known as the Spider, Bee, and Fly Orchises; as well as those exotic species, which are cultivated in our stoves, and which are still more curious than those just mentioned, of which the Butterfly plant, the Dove flower, and the Helmet flower are examples. Formerly, every one who grew such plants was obliged to cultivate them in the stove with a high temperature, and for this reason they might then be considered beyond the means of the amateur in gardening. Of late years, however, many of the same race, equally beautiful with the others, have been sent to England from comparatively temperate countries, such as the high lands of Mexico and Guatemala, and it has been proved that they will grow and flourish best in a temperature little higher than that which we find in our common greenhouses. As your correspondent "Clericus," and some of the numerous readers of this paper might be inclined to put up a small house for these plants, I will now give the practical directions for their management, which were promised to "Clericus" some time since. The house should be heated with hot water, as these plants do not succeed so well with the dry heat of a flue. Throughout the winter months the temperature at night need never be kept higher than 55 degrees; but it may be allowed to rise to any height with sun-heat, at that time of the year, without giving any air. No artificial heat will be necessary at night, so soon as the thermometer ceases to sink below 50 degrees or 55 degrees in the house, and as the season will be advanced at that time and the sun's rays powerful during the day, a canvass shade will be indispensable, which must be drawn over the glass when the sun shines, and removed about four or five o'clock in the afternoon, in order that the air of the house may get warmer for the evening. The atmosphere of the house must be kept always saturated with moisture, and air should only be given during very warm weather, and then sparingly; by this means the moisture in the house is not carried off so quickly, and the plants do not suffer. The soil which these plants grow best in, is that brown turfy peat which is generally found on commons where the grass or heath grows luxuriantly. Many of them grow well, and are most characteristic, when placed in baskets, or on blocks of wood, and suspended from the rafters of the house; others succeed best in pots in the common way, but well drained, and others again will do well in either way. The kinds which are hung up ought to be liberally syringed at all seasons when they are growing, and particularly during the summer months, when they are apt to get too dry. A little practice will soon enable any one to manage them; in fact they are much easier managed than common greenhouse plants, and not so easily injured by neglect. When in flower they may be taken into the sitting-room without suffering in the slightest degree, and then sent back to the house after the flowers have faded.

In a house of this description, many other interesting plants might also be grown. There is the Nepenthes, with its curious pitcher-bearing leaves, which could be grown at the warmest end above the pipes; the Dionæa or Venus' Flytrap, which clasps anything which may touch its irritable hairs, and resembles in this respect an animal more than a plant; and some other things which would render such a place highly interesting. The Orchidaceous plants themselves, suspended from the roof of the house, and many of them growing, not in soil, but in "thin air," upon which they flourish, forming roots, stems, and leaves, are subjects of the highest interest, independently of their beautiful flowers.—*R. F.*

HOME CORRESPONDENCE.

New Method of heating small Stoves.—I was much interested in the description, in page 348 of your valuable journal, of a method of heating an Orchidaceous house and stove, by Mr. Beaton, which claims, and justly too, the merit of cheapness, when compared with other systems. If you are not tired of the subject, I would submit to your notice a method of mine, which if not the last, will, I dare say, be the *least* you have ever been troubled with. My little stove contains an area of some 7 feet square, which was first heated by a small flue; but having taken a fancy for Orchidaceous plants, and being desirous to generate the moist heat desirable for them, I got from the nearest foundry a cast-iron boiler (similar to those recommended by Mr. Rogers), of very small dimensions, which I had built in at the back of the furnace, the flue passing below, round, through, and over it. My little boiler is 9 inches high, 7 inches over at base, and 6 inches over at top—the centre open cylinder being 4 inches wide at the base, and 3 inches at top. Two gusset, or socket ends, 4 inches long, were cast on one side, into which were fixed with rust two pieces of cast-iron 1-inch gas-pipe, 10 inches long, having also gusset ends. Into these were fixed with lead, two pieces of 1-inch copper pipe, 4 inches long, to which were soldered two pieces of 1-inch lead pipe, about 15 inches long, which connected the boiler with a wooden trough 26 inches long, 13 inches wide, and 12 inches deep. The very small quantity of water in the boiler, and the comparatively great surface exposed to the fire heat, very soon warms the water in the trough, and a smart fire sets it in action. The trough is closely covered in; but a hole in the cover, on which is a sliding lid, allows the vapour to escape when desired, and about 3 feet of 1-inch iron pipe, from the cover through the rafter, allow the steam to escape when not wanted. In this little structure I have realised by this plan the object of a long cherished wish, the *means* of cultivating two or three dozen small specimens of this curious and pretty tribe. The temperature of the water in the trough soon gets to 120°, with a moderate fire, and is in the morning about 100°, although the fire is out; so that it is easy to keep up the required temperature and moisture. The cost of this little boiler, including the pieces of gas-pipe, was only 14*s.* 6*d.*, the plumber's account for copper, solder, lead pipe, and time, 14*s.*; the trough cost 6*s.* 6*d.*, the steam pipe, 3*s.*, to which add 3*s.* 6*d.* for mason, and 8*s.* 6*d.* for material and assistance—in all 50*s.* I am certain it did not exceed this cost, as having the mason at other jobs, the material used is only guessed at. I have been thus particular as to the cost, as some middle-class amateurs may covet, even to a small extent, the luxury of a moist stove, and be deterred from the attempt by statements of the cost of those elegant structures described in various journals. It will be seen that the dimensions I have given were what were required in my peculiar circumstances—being guided by the size of house, the situation of trough, &c. The same end can be obtained by shallow gutters, along or around the house, or by zinc, iron, or other pipes—which, the boiler being close, can be carried to any height. I may state that the boiler had to be cast *open* at top, but was afterwards closed by the jointing composition called rust.—*Daniel Weestove.*

Pruning Forest Trees.—I had certainly intended to trouble you once more, with a few words by way of comment, on Mr. Billington's letter, which appeared in your number of May 21st, but your own leader on the subject has so completely superseded the necessity of it, and in itself carries so much home argument, that I conclude Mr. B. himself will now give in. Indeed, I could not help inferring that his opinions were on the waver, from the tenor of his letter; and I think, he must now be convinced that the principle with which I first set out was the "true one" as regards increase of timber, namely, the reciprocity between root and head, and the greater the reciprocity, the more rapid the increase of stem. In the paragraph of your article, prior to the first diagram, it is observed that some trees, despite of thinning, &c., prefer to grow "bushy headed," and what follows is all very pertinent to the argument as to pruning; but after all, why find fault with some trees for that (to them) natural propensity? Is it necessary that all trees should grow to gigantic "Ramrods?"—I say no, and remember to have read many grave suggestions to get trees to grow crooked and bushy, mixed with lacrymose lamentations on the exhaustion of knee-timbers for supply of our navy, &c. This fear of famine is now, I believe, superseded by the use of iron; but, for all that, I do not think either profit or picturesque beauty requires all trees to be trained alike; which would only present a monotonous uniformity, at once abhorrent to nature and repugnant to good taste. Now for a word of advice. I hope you will take a timely hint from the Duke of Wellington, and get your windows secured in like manner to those of Apsley House; for you may rely on a visit from a mob of famishing operatives from Sheffield or Wolverhampton, whose staff of bread will be cut off. These poor men will have *you* to thank that no more pruning chisels, saws, and other instruments of tree-torture are required.—*Quercus.*

Cedar of Lebanon.—I have a Cedar of Lebanon about 25 years old, and 12 feet high, in the middle of the flower-garden; the soil a light loamy one, and gravel at the depth of from 5 to 6 feet. The bark has a good many cracks, with considerable bleeding from two of them on one side; some of the lower branches dead; and the tree altogether having an unhealthy appearance. Several of the branches have not made new shoots, and those which have, to only about an inch or half an inch long. As it is a very favourite and ornamental tree, information as to the best mode, if any, of stopping the bleeding and decay, and whether it can be done at present, will be thankfully received by *Jurisconsultus.* [We are unable to answer this question. Can any one answer it for us?]

The Black Naples Currant.—This has been several years in the garden of the Horticultural Society, and though said to be superior to the common kind, is never seen. Is it on sale by any nurseryman of respectability? I had it nominally about 1831 from a nurseryman, but it proved a worthless kind to me and to those to whom I gave it. After some years' trial, I threw away the five or six bushes left; and having lost the bill, cannot give you the name of the worthy who sold them to me. Are no new kinds raised from seed? I do not recollect ever reading that the same root of the common Onion will produce seed for at least three years in succession: how much longer I know not; but this may be seen in many cottage gardens in Norfolk. A poor man near me has now a third crop, on the same roots, which promises to be superior to the two first crops.—*S. H.* [The common Onion is a perennial, but it generally lasts only two years in this climate. The Black Naples Currant is the largest and best variety known, and must exist in many nurseries as well as private gardens; for it has been distributed to

Fellows of the Horticultural Society, on application, for the last 20 years. It comes into leaf earlier than other black Currants, so that by this, in one year, the correctness of plants may be known. No seedlings have appeared of equal merit.]

Hellebore Powder and Gooseberries.—We have received another communication upon this subject from a correspondent signing himself *R. D.*, from which it appears, that after having sprinkled the Gooseberry-bushes, which were attacked, with the powder on a dewy morning, the effects were soon visible, in the extirpation of all the caterpillars upon which it fell. There is no longer any doubt respecting the efficacy of *genuine* Hellebore powder, in destroying this pest: and those who have not found it produce due effect must attribute their failure to the bad quality of the powder sold by druggists.

Chemical Analysis of Plants.—I quite agree with "Ortolano" in the importance of extending chemistry to the analysis of plants, so as to ascertain the component parts of each. I think, however, in order to ascertain what element is absent which is essential to produce a vigorous plant, it will be necessary not only to analyse the plant, but also to extend the examination to them both in a healthy and an unhealthy state, and to the soils in which they were grown; and then if we find that by adding the element to the soil in which the unhealthy plants are growing they afterwards become vigorous, we shall have something like demonstrative proofs of the elements which are necessary to induce a vigorous growth. But in the case of newly introduced plants, we shall still have to trust in a great measure to chance—for it will require a plant of considerable size to afford ashes sufficient for a satisfactory chemical examination. Hence, I think we shall be a long time before we can place ourselves on a level with the zoologist, and, at the sight of a plant, be enabled to answer the question—"What does it feed upon?" Much might be done if cultivators would concentrate their efforts. Thus, in the case of new plants, if half a dozen or half a score gardeners could procure only two or three drachms each of the ashes of a plant, they would together raise sufficient to enable a chemist to go properly to work. How much might be accomplished if the principal contributors to the *Chronicle* would enter into an agreement to send all the ashes they could procure of certain plants, to Mr. Solly, for examination. This would do much to simplify our labours, and would soon place quacks and quackery outside the garden walls. With plants that are plentiful, such as Pines, Vines, Peaches, &c., &c., some interesting experiments might be performed by burning the refuse plants and prunings, and manure a certain number of plants with their own ashes; and if the produce is improved thereby, we should then, by analysis, have the key to the aliment indispensable to the well-being of the plants. All that would be necessary, in the absence of a crucible, would be to burn the plants on a piece of clean stone or slate, and to keep the ashes clear of oxide of iron and other mineral impurities.—*W. P. Ayres.*

Destruction of the Leaves of the Laurel.—Can any of your correspondents inform me what insect feeds on the leaves of the common Laurel? In a late excursion in Warwickshire and Staffordshire, I perceived, in various shrubberies, the leaves of nearly all the Laurels destroyed, or perforated by some grub or insect, which I in vain attempted to discover. The Laurel is so very powerful a poison, when bruised, that it is used by all entomologists to destroy insects; it is for this reason that I am anxious to ascertain what creature it is that is nourished by this poison.—*Entomologist.*

Injurious Insects.—The enclosed Beetle I find very destructive to Forest and other trees. It makes its ascent during the night, and feeds on the foliage and bark both of young and old shoots, and during the day lodges at the foot of the tree, slightly concealed in the earth, from its great resemblance to which it is difficult to detect. Both last year and this I have had several young wall trees very much injured, and many forest trees, from 8 to 10 feet high, some completely killed, and others greatly damaged, by this nightly depredator. It had ascended to the very top of the trees, and stripped the twigs of both bark and foliage. Among the trees it had injured were the Mountain Ash, Turkey Oak, Limes, and Birch. They commence their depredations about the middle or latter end of April, and continue them for several weeks. I tried various experiments for their destruction, but found nothing to answer effectually but boiling water, which I poured on the ground from the spout of a watering-can, without a rose, all round the trees, at about 6 inches from the stem. I applied about half a pint to each, which entirely destroyed the insect without doing any injury to the trees. Should you be able to name the insect, and spare room for the insertion of these few hints, probably they may prove beneficial. I published the use of hot water for the destruction of insects some years ago; and were I not afraid of trespassing too much on your valuable pages, I might again resume the subject.—*Joshua Major, Landscape Gardener, Knosthorpe, near Leeds.* [This is the Otiorhynchus picipes, formerly called Curculio vastator, because of its destructiveness.]

Bees.—Last year I put a May swarm into a large skep, and the season being bad, the Bees died in the autumn. I cleaned as many of the dead ones as I could from the comb, intending to put a second swarm into the same hive, as I wished to know if they would settle in it, and use the comb. The hive and comb had been exposed to the sun and air, in order to keep it as pure as possible; and it has been for some days standing on my bee-stand. Yesterday a number of Bees were seen about the mouth and around the hive, and on looking into it, I saw several hundred Bees running about, which seemed to be cleaning the comb; this is evidently much whiter now than before the Bees came. This morning the number of Bees has increased, and they are hanging from the point of one of the pieces of comb, and apparently adding to it. The Bees all left the hive last night; and I am not sure whether I am doing right in allowing the skep to remain where it is, as it may be tempting a neighbour's Bees. I have heard an old bee-keeper speak, in no measured terms, of a "lure-skep." Perhaps you, or some of your correspondents, will advise me as to what I ought to do. I had a swarm on the 30th ult. which stands within three feet of the "lure-skep." The stray Bees appear to be of the same stock as my own; but on placing some of them near the entrance of the other skeps, they immediately commenced fighting. There are several bee-keepers in the neighbourhood, and several stocks of Bees in the roofs of houses and old hollow trees. The nearest to me is a very strong stock, which has for many years been under the tiles of a house. Since writing the above, I have been asked by a party who considered himself very ill treated by a neighbour, whether any one can answer to set an empty bee-skep with its mouth downwards? The case is this:—Two bee-keepers live in adjoining premises. The one, an old woman, had saved with great care through the winter an only skep, which was very weak in the spring; and one day all the Bees left her hive, and went to one of the four old stocks of her neighbour's, at which the old lady was very wroth, and declared she would have them back again. When they came to the neighbour's hive, a battle ensued, and many were killed, probably all the old lady's. The old lady is now having her share of the fun. She has set an empty skep in the place of her dead one, and put several pieces of old comb under it. Several hundreds of Bees are now come to the old lady's empty skep, and the keeper of the four states they are his, and declares he can see them go from one to to the other. The keeper of four has been to the old lady's premises, and turned her skep bottom upwards; and she declares she will come and serve all his the same, and scald them all with boiling hot water. Is there any, and what remedy for these evils?—*M. H. G.*—[Yes, there is an infallible remedy. Let these two silly folks read their New Testament, and act upon the good precepts there inculcated; no advice of ours will do them any service.]

The Wireworm and Dahlias.—In case your correspondent, Mr. F. Chase, should not find "spirits of tar" effectual in arresting the ravages of this intolerable pest, he will find that he can entrap them by placing pieces of Carrot or Lettuce stalks in immediate proximity with the roots of the plants which he wishes to preserve. By examining them once or twice a day, he will soon rid his borders of the nuisance. In this way I have caught many scores in a day, for weeks together. Nitrate of soda I have also found offensive to them, but I cannot say that it will destroy them. This is a tedious method, but it will be found effectual.—*W. P. Ayres.*——In your paper of June 4th I find a communication from Mr. Chase, of Luton, complaining of the destruction of his Dahlias by the Wireworm, and requesting information how to prevent it. About three years ago I was injured in the same way; and the year following I planted three or four young Lettuce plants round every Dahlia. The wireworm immediately attacked the Lettuce, which was at once seen by the drooping of their leaves. I then took them up, and destroyed the worms, which I found at the root, and again put the plants into the ground—or, if too much eaten, I put fresh ones in for another attack. By this means I have got rid of the pest; and by continuing this every season, I have always saved my Dahlias—nor have I lost one since I commenced the practice. Neither wireworm nor slug will touch a Dahlia if a Lettuce is near it, as they so much prefer the latter.—*J. T. Manchester.*

Vipers.—If "Totty" will look for the Viper about three o'clock on any bright afternoon, he will be almost certain of finding it coiled up, and basking in the sun, when it may be easily shot, or knocked on the head with a stone.—*Lusor.*

Cypripédium Calceólus.—I shall be obliged if any of your correspondents will inform me of the best method of propagating the "Cypripédium calceólus." I once had 6 fine plants, which were brought from Castle Eden dean, in the county of Durham; but from want of management I have only one plant left. It has this season produced two strong stems, each of which had two flowers. They are now faded, and as I find that Loudon recommends propagating them when growing, I wish to know whether the offsets should be taken off and replanted now, or be suffered to remain on the old plant until the foliage decays in Autumn.—*H. W.*

Change of Colour in Violets.—Has the changing of the colour of Violets from blue to white been observed by any of your numerous readers? In the Russian Violets the early blossoms come blue; the late ones white.—*C. D. B.*

Schabziguer Cheese.—Having observed your remarks in the last *Gardeners' Chronicle*, on Schabziguer cheese, I trouble you with a few words as to what I know about it. When I was abroad I went to Glarus and the Valley of the Lint, where there are fields of blue Melilot, which is about the height of Lucern, and is called, in a German botanical work I had with me, "Melilotus Schabziguer." When the seed is ripe, the crop is cut, and partially dried, like hay; it is then crushed, and mixed with a poor kind of cheese, called from it "Schabziguer." We brought home some seed, which succeeded very well; but as it was of no use, and the smell most unpleasant, we have not continued to grow it. The smell is exactly like that of a pigsty, in spite of which bees seemed very fond of it.—*A. W. Childers.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

June 7th.—Sir O. Mosley, Bart., in the chair. F. Foljambe, Esq., was elected a fellow. Owing to the near approach of the exhibition at the Gardens, the subjects shown were not numerous. From J. Bateman, Esq., a collection of cut blooms of Orchidaceous plants, containing Aerides Brookei, an exceedingly beautiful and comparatively new species, from Bombay; the flowers are sweet-scented, white, and the labellum margined with rosy purple, which gradually loses itself towards the centre; it first flowered at Norton Priory in June last, with Sir R. Brooke, after whom it was named; but the merit of its introduction belongs to C. Horsfall, Esq., of Liverpool, with whom it flowered this spring, producing a panicle upwards of 2 feet in length, with numerous branches and 52 flowers; Grammatophyllum multiflorum, with greenish yellow flowers, spotted with olive; Odontoglossum læve, whose perfume resembles that of the tuberose; Govenia liliacea, white, with the two upper petals delicately spotted with light purple; Epidendrum alatum, which, although not particularly handsome, deserves cultivation on account of its agreeable perfume; Brassia maculata, and the pretty Dendróbium moschatum: a Knightian medal was awarded for Aerides Bróokei. From Mr. Green, gr. to Sir E. Antrobus, two seedling Cacti, bearing considerable resemblance to C. Ackermanni, and a remarkably fine plant of Tropæ'olum edule, a pretty new species, with dark yellow flowers and slender foliage; it is likely to prove a valuable addition to this beautiful genus; a Banksian medal was awarded for it. From the Earl of Caernarvon, a collection of cut blooms of Azaleas, flowering for the first time; these had flagged greatly from the journey and the heat of the room; most of them were hybrids between A. sinensis and other varieties; and from what could be judged of them in their present condition, some of them bore evidence of considerable beauty. From Mrs. W. Phillips, two well-grown double Stocks, in pots. From Mr. Paine, gr. to Miss Wigan, a seedling Cactus, called fúlgidus, but very much like to C. Ackermanni. From Mr. Beck, two healthy seedling Pelargóniums, in slate pots; they were the same as were exhibited in February, and had received no other than common attention; they were so far interesting, that they proved pretty clearly that this class of plants will grow in slate pots, equally as well as in those made of a more porous material. From Mr. Ivery, a white Verbena, called the Queen; not sufficiently distinct from other well-known varieties. From Messrs. Treggon, one of Ward's portable cases; differing from those in general use, in being so constructed that by means of an apparatus for containing hot water, they can be kept above the ordinary temperature in cold weather; also in having a door, which in some cases will prove very useful, and do away with the necessity of taking off the roof whenever anything requires to be done in the inside. From the Gardens of the Society a collection of plants, consisting of a well-bloomed specimen of Clématis Siebóldii; Statice mucronata, a pretty species, not so much cultivated as it deserves to be; Fúchsia Monypénnii, a good hybrid; the showy and new Campánula grandis; Pernéttia angustifolia, a handsome dwarf shrub, with white heath-like flowers. There were also cut flowers of a new hardy species of Indigófera, from the north of India, with lilac and rose-coloured blossoms; of Pæonia albiflora Whitleji, an excellent variety, with milk-white flowers, slightly tinged with pink; and a large collection of Azaleas and Rhododendrons. The profuse bloom of these may be ascribed entirely to the seed-vessels having been picked from the plants as soon as the blossoms had faded, thereby preventing the plants from wasting their energy in the formation of seeds. Every year since this was first practised, the bloom has been more abundant. There was also exhibited by Mr. Paine a piece of wood rendered incombustible by some process which has not yet transpired; silica and lime, however, appeared to be two of the ingredients used in this preparation; a small chip was held over the flame of a candle for a considerable time, without receiving any injury, except being charred.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

June 1.—His Grace the Duke of Richmond, K.G., in the chair. His Grace the Duke of Devonshire, K.G., was elected a governor, and the Earl of Harewood, Sir G. Talbot, Bart., W. J. Caparn, and W. Child, Esqrs., members. Col. Challoner brought forward a motion respecting the engagement of a collector, to get in the subscriptions of members residing in London; and authority was granted for the engagement of such a person. Various details respecting the meeting at Bristol having been settled, the Bristol Committee were authorised to make arrangements for the delivery of scientific lectures on agricultural subjects, on the Tuesday morning of the week of the meeting at Bristol, to the members of the society. Sir C. Morgan, Bart., V.P., signified his intention of offering two prizes at Bristol for the encouragement of the Glamorganshire breed of cattle, viz.:—For the best pair of two-year-old Glamorgan heifers, 10*l.* 10*s.*; for the second best do., 5*l.* 5*s.*, without any restriction as to the owner and breeder, or for feeding; regarding this breed as not inferior to many others, either as dairy cattle or draught oxen, or for the purposes of feeding for the butcher. The council agreed that Sir C. Morgan's offer should be accepted. It was decided that no certificate, or entry of stock, or article of exhibition, at the meeting at Bristol, would be received after the 14th of June. The Duke of Richmond laid before the Council a letter from the Earl of Hardwicke, expressive of his thanks to the society for electing him president for the ensuing year, and to preside over the meeting at Derby in 1843. Mr. Daniel, of Burton-upon-Trent, transmitted a list of the prizes given to the tenantry of the Marquess of Anglesey; and Mr. Bromley, secretary to the south Derbyshire Agricultural society, and Mr. Eames, treasurer of the Ashby-de-la-Zouch Agricultural Association, the prize sheets and local regulations of their respective committees. J. Barton, Esq., addressed a letter to the Duke of Richmond, on the advantages which would result from a collection of all that had been effected in the departments of agriculture, science, and practice in this country, as well as in foreign parts. He adduced, as an illustration of its value, the question of the comparative nutritive value of different kinds of food for cattle, in reference to which no less than seventeen authorities had been quoted by the celebrated modern writer Boussingault, in the "Annales de Chimie," all of which, excepting three, were unknown by name to Mr. Barton, nor could he acquire any further reference to them or their writings; thus proving how little we know of what is going on in other parts of the world on questions of interest to ourselves and others. He therefore suggested that these foreign journals should be taken in by the society, and a review of the facts they contained be made available to the English reader; and that a summary should also be made from English authors who have written with success on given subjects. On the subject of farm-yard manure, he observed that A. Young had received a gold medal from the Bath Society, in 1804, for a memoir of the various experiments made by him on its management; and Von Thaer had also referred to other experiments on the subject, to none of which Mr. Barton had been able to gain access; but as the society had offered a prize for the best essay on the management of farm-yard manure, he would of course deem it essential to the performance of their task, to consult those details. The Duke of Richmond expressed his opinion of the importance of such a summary. Mr. Pusey informed the Council that Dr. Buckland had procured for them, through Mr. Ruffin, of Petersburg, Virginia, the valuable American work entitled the "Agricultural Register"; ordered that a complete set of the Society's Journal be transmitted to Mr. Ruffin in acknowledgment. Mr. R. Rigg, F.R.S., addressed a communication on the conditions under which experiments in agricultural science should be made. He is fully persuaded that the reason why agriculture has not derived much benefit from chemical science, is, that the experiments upon which the philosopher has based his theories, have not been made in a practical manner, that they have been imperfectly examined, that analogy has too frequently supplied the place of inductive evidence, and that the knowledge derived from practical experience has not been sufficiently recognised: and, as he is fully convinced that most farming operations will derive benefit from the evidence sought out of well-directed experiments, when carefully examined in all their parts, he trusts that no endeavour will be wanting on the part of the leading members to induce scientific men to make experiments which have a reference to the discovery of principles applicable to agriculture; and that they will use their influence in impressing upon such the necessity of attending to what is taught only by each experiment, and not entangle the experiments with existing theories. Mr. Rigg concludes with a recapitulation of the objects in agricultural chemistry which have long engaged his attention, and from which he thinks that carbon is the vegetable product made by plants, and varying in quantity with the kind of land on which they grow; that the uncombined nitrogen in the atmosphere enters largely into the constitution of growing plants; and that it is difficult to conceive anything more at variance with the results of chemical experiments, and practical agriculture, than the theory which supposes plants to derive the principal supply of their carbon from the carbonic acid of the atmosphere, and of their nitrogen from ammonia. Mr. T. Smith, of Nova Scotia, inquired, in reference to Daniel's manure: "Is the new patent manure, composed of pulverised wood saturated with bituminous matter, united with soda and lime, of more value than the lime and soda used without the other articles? Soda is certainly a powerful manure, but too expensive. We have here large tracts in which the soil contains so much sulphate of iron, that lime, in ordinary quantities, has no sensible effect; but, on such soils, oyster-shells, coral-gravel, or old plaster, have a permanent good effect, owing to the quantity of carbonic acid gas which is disengaged from these calcareous substances, by the action upon them of the sulphuric acid which is constantly forming from the sulphuret of iron in the subjacent rock. Wood-ashes, even after 'leaching' by the soap-boilers, make a permanent and powerful manure; they contain here a large quantity of sulphate of potash. It is observable that, at a distance from the sea, ashes are of less value, while gypsum, which has no effect near the sea, is on many crops very useful in inland situations. It may also be observed, that very high winds here sometimes throw showers of salt-water over the land, to the distance of twenty or five-and-twenty miles from the sea; the water being sometimes much salter than sea water when it falls. As the line that marks the situation where gypsum commences to be useful, is near that which limits these salt showers, may it not be that the salt prevents the gypsum from operating?"—Mr. Miles, M.P., presented a tabular view of manures, with an account of their properties and mode of application, drawn up for the use of the agriculturist, by John Robinson, M.B., lecturer on agricultural chemistry and rural economy. Mr. R. Barker communicated some observations on the use and abuse of lime as a dressing for land, by Mr. W. H. Fisher, of 18, Conduit-street, London. The author's great object is to impress upon farmers the importance of using quick lime, and not lime which once had been quick, but, by delay in use and exposure to the atmosphere, has become *effete*, and has absorbed from the air the carbonic acid, which again changes it to the carbonate of lime it was before burning. He considers that many thousands of pounds are annually thrown away by agriculturists from want of a proper knowledge of this fact; and recommends them to use it in the fresh-burnt state, by carting it direct from the kiln upon their land, spreading it in the lump, and in that state ploughing it in directly. He concludes with the following remarks: "The lime will be found, if properly burnt, on a second ploughing, to be crumbled to pieces, and on harrowing will be intimately mixed with the soil. From the heat evolved during the slacking of the lime underground, and its causticity, it will be found to be obnoxious to Wireworms, Slugs, Grubs, and other enemies which are very frequently the cause of failure in crops; as well as in rendering inert vegetable matter in the soil soluble. Chalk, no doubt, is a very useful addition to many soils; but do not go to the expense of burning lime, and then allow it to be converted again into chalk, or carbonate of lime, before you plough it into your land. In some districts the limestone is burnt in large lumps, particularly where wood is employed as a fuel; in which case it should be broken to the size of a small penny roll before it is ploughed in. If the Turnip fly is generated in the soil, lime, applied as above, would no doubt do much towards its extermination; and the same effect and result would hold good in respect to the Black Caterpillar. Mr. Pusey, M.P., presented a bundle of Early Vetches, grown at East Ilsley, in Berkshire, by Mr. William J. Williams. They were planted on the 26th of last August, on a light red soil, on a patchy subsoil, sometimes chalk or gravel, without the least shelter or protection. They followed an early crop of Barley, which was after Swedish Turnips manured with stable-dung, and half the Turnips carted off. 2 bushels of Rye and 2½ bushels of Vetches were used per acre. The sheep kept on them the last fortnight refused the rye (which is inconsiderable compared with the Vetches), but the cart-horses were well satisfied with their nice appetites, as they fed well on what was remaining in the sheep-racks. There is a spurious Vetch introduced for this variety, which has caused disappointment to those who used it. Professor Royle presented, on the part of the East India Company, a supply of the seeds of the *Pinus Deodara*, or Himalayan Cedar, for distribution among the members. The Duke of Richmond gave notice of a motion for restricting the legislative power to the monthly meetings of the council, and reserving the weekly meetings for the election of members, and the reception of communications, giving members the privilege of being present at such meetings and discussions. Mr. W. W. Cawston, transmitted the following result of ploughing in green crops:—When Trefoil has been seeded, Clover or other layers failed, Peas or Tares grown, or a clean summer fallow made for Wheat, in the middle of August, or there about, skeleton-plough, or plough very flat, and sow a peck of White Mustard seed per acre, harrow in with light drags, clean off any Grass or rubbish, and as soon as it is well up, top dress with a light coat of farm-yard dung (say 6 or 8 loads of 32 bushels). In 6 or 8 weeks a heavy luxuriant crop will be ready to be ploughed in for Wheat as soon as the flowers are beginning to open. This operation may be easily accomplished when the plant has risen 3 or 4 feet high, by attaching a chain to the head and handle of the plough, which will completely draw it all into the furrow, and the following land buries it neatly. A large supply of vegetable manure is thus cheaply obtained, and the seed costs now about half-a-crown per peck; while the Mustard, if wanted, is excellent feed for ewes at tupping time. Mr. Slaney gave an account of Alexander's long plough for cutting out drains, and also of the new concrete draining tile, manufactured by Mr. Smith, of Deanston, composed of sand, lime, &c., cheaper and superior to those at present in use. The Duke of Richmond stated that in Scotland he had found great advantage in draining with peat-tiles, formed out of peat cut, by means of a proper spade of a semi-cylindrical shape and dried. These on being exposed to the air, became changed into light porous masses of indurated peat insoluble in water. He stated that a large lake, having a peaty bottom, had been drained in this manner, the water and mud having been scooped out and the peat exposed for 3 months to become dry; and at the end of 5 years it was found free from decay or obstruction. Mr. Kimberley presented a specimen of a vegeto-mineral substance found in peat, varying in depth from 1 foot to 2 feet and a half from the surface, lying in horizontal beds of an inch or 2 in thickness. The peat in which it occurs is almost entirely vegetable matter, resulting from the decay of timber and rushes; both the peat and water are strongly impregnated with iron. When first taken the substance is of a white colour, but on exposure to the atmosphere changes it to a blue powder.

LINNEAN SOCIETY.

June 7, 1842.—Bishop of Norwich in the chair. Dr. Joseph Hooker was elected a fellow. The voluntary subscriptions for liquidating the debt of the society, was announced by the Secretary to amount to about 800*l*. An account of a new fish, taken on the coast of Cornwall, and nearly allied to the genus Hemiranthus, was communicated by Mr. Jonathan Couch. The specimens taken were young, but from the character of the fish, Mr. Couch was disposed to think it ought to constitute a new genus. Part of a paper, by Mr. Clarke, was read, on the Sea Cocoa-nut, Lodoicea Sechellarum: this tree belongs to the Palm tribe, and is abundant on the Sechelles islands, where it attains a height of 70 or 80 feet. The leaves are palmated and very large, the petioles measuring frequently 15 feet, and the lamina the same length, their breadth being 10 or 12 feet. The plants are diœcious. The largest are calculated to be at least 4 or 500 years old.

BOTANICAL SOCIETY OF LONDON.

June 3.—J. E. Gray, Esq., President, in the chair.—Mr. J. A. Brewer exhibited living specimens of Ophrys muscifera, Aceras anthropóphora, Orchis bifolia, Orchis ustulata, Paris quadrifolia, and other interesting plants from Reigate. Mr. T. Twining, jun., exhibited a large collection of cultivated specimens from Twickenham. Mr. M. J. F. Sidney presented a specimen of Lycopódium lepidophyllum, from Valparaiso. Mr. A. Gerard presented an interesting collection of plants from Sierra Leone, collected by Mrs. Blyth. The continuation of the paper commenced at the last meeting, On the Flora of the Malvern Hills, being a sketch of the cryptogamic vegetation indigenous to the chain, by E. Lees, Esq., was read. The Author remarked that among the Hepaticæ occur Anthóceros punctatus and Targiónia hypophylla, the latter at the foot of moist rocks, on the Worcestershire Beacon; while there are three species of Marchántia, polymorpha, cónica, and hemisphærica. The Jungermánniæ are not in such variety as might have been expected, though some of them, especially Tamarisci, dilatata, and ciliaris are abundant upon the turf of the hills, as well as upon the rocks, and investing the dwarf decrepit Hawthorns, that, bowed down by the wind and old age, creep almost double upon the ground. Jungermánnia pinguis, Linn., is excessively common, though very rarely fruiting. Jungermánnia tomentella is a beautiful species, that has only occcurred in one place, on a dripping rock in "The Gullet." A list of those species observed by Mr. L. was given. The Malvern Hills are particularly remarkable for the various Lichens they produce, most of which grow in a very luxuriant and beautiful manner; and in the moist autumnal and wintry months many of the rocks present an appearance from them truly gratifying to the lover of nature. Some of the harder granitic rocks are entirely covered with the Umbilicaria pustulata, which at this time is of an olive green colour, and as flabby as a piece of moist leather; though in the summer months it appears as black and sooty as if subjected to the action of fire. On other rocks, the deep purple Parmélia omphalodes extends itself, contrasted with white patches of the grey P. physodes, the darker saxátilis, the dingy olivácea, or the conspicuous glaucous pitted thalli of Sticta scrobiculata. On the higher rocks, the curled Cetrária glauca grows in abundance; while a venerable hoary aspect is imparted to the protruding masses, by the silvery Isidium coralloides, and the still more coralline appearance of Sphærophoron compressum. The Reindeer Lichen, Cladónia rangiferina, is plentiful on the Turf, with its allied species, and the sadder and darker Corniculária; while in every part the brown and scarlet apothecia of the Scyphóphori, in all their multiform varieties, contribute to decorate the scene. In the whole, including the cortical Lichens, about 220 species are met with. The paper concluded with a list of Fungi found in this interesting locality. Dr. J. B. Wood presented specimens of Carex elongata, found at Charlton, near Manchester. It was announced that Mr. A. Henfrey had been appointed curator, and that the Herbarium might be inspected every Monday, Wednesday, and Friday, from 10 to 4; and on Friday evenings from 7 to 10. Also, that the first excursion of the members of the Society would take place on the 7th instant.

FLORICULTURAL SOCIETY.

June 6.—Mr. Edmonds in the chair. The manner in which the two succeeding exhibitions should be conducted, and the value of the prizes to be given at those meetings, were finally settled. It was agreed that prizes should be offered both to amateurs and professional florists, for Pinks, Pelargoniums, Ranunculuses, Roses, and Heartsease, at the meeting on the 21st of June; and that the extra prize, viz., a silver cup, of the value of 5*l*. 5*s*., offered by D. Sheares, Jun., Esq., should be given for the best collection of 36 varieties of Roses, to be exhibited in single blooms; these, in all cases, to be distinct, and unaccompanied by anything but the foliage of each variety. In addition to the prizes offered by the society at the exhibition on the 19th of July, for Carnations and Picotees, it was decided, that the silver cup, of the value of 5*l*. 5*s*., presented by Dr. Lindley, should be awarded to the best Picotee of the present year, provided it were a 1st class flower; that the entries for this prize should be made distinct from those given by the society, but that any Seedlings exhibited for the society's prizes, and to which 1st class prizes could be awarded, must be subsequently entered for the cup.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Jasminum caudatum. Tail-leaved Jasmine. Jasmináceæ. Diándria Monogýnia. (*Stove Climber*).—A very handsome but scentless Jasmine, inhabiting the warm valleys of the Sylhet mountains, whence it was introduced into the Botanic Garden, Calcutta. It is a graceful, healthy-looking plant, with deep green, handsome leaves, which are tapered into very long narrow points, whence the name it bears has been given to it. Although the flowers have none of the perfume of the Jasmine, the large and snow-white masses of them render it a handsome species well worth growing. It requires the temperature of a cool stove, where it grows and flowers in great luxuriance. It is well adapted either for planting out in the border of the stove and training up the rafters, or for twining round stakes in a pot. The soil which it seems to like is a mixture of loam, leaf-mould, and rotten dung, but it will grow in any free soil. It is easily multiplied by taking off cuttings of the young wood, planting them in sand, and plunging the pots in bottom-heat.—*Bot. Reg.*

Aza'lea altaclerensis. The Highclere Azalea. (*Hardy Shrub*). Ericáceæ. Decándria Monogýnia.—This, the most charming, perhaps, of hardy Azáleas, uniting to the utmost beauty of form and arrangement of colour a most delicious fragrance, is one of the many additions made to our horticultural treasures in this family by the gardens at Highclere, from whence it has been communicated to us by the Earl of Carnarvon. "It was produced by fertilising the flowers of Azálea sinensis with the pollen of the late-flowering variety of A. viscosa, called by the nurserymen A. rubescens major. It bears the most decided evidence of its double parentage, having the glaucous foliage and inflorescence of A. sinensis modified by the pale crimson tints of A. rubescens major. It is most profuse of its odorous flowers, which cover the whole bush, and is altogether a very striking production. We have named it Altaclerensis in commemoration of its origin."—*Bot. Reg.*

Ornithógalum divaricatum. Straggling Star of Bethlehem. (*Hardy Bulb.*) Liliáceæ. Hexándria Monogýnia.—Mr. Hindes, the surgeon of the Sulphur surveying ship, met with this on the coast of California, and sent it to the Horticultural Society, in whose garden it flowered last June. It has large oblong bulbs, covered with coarse brown scales; the leaves are very long, wavy, channelled, of a dull green colour, and being too weak to support their own weight, they lie prostrate. The flowering stem is erect, about two feet high, panicled from the base, with straggling branches bearing slender racemes of distant flowers. The latter are white, with a green stripe along the back of each division. It is a hardy bulbous plant, requiring the same treatment as Verarums or Helónias, and growing freely in any rich sandy soil. It flowers from July to August. But a single bulb was received from Mr. Hindes, without any other indication than that of California. It has hitherto failed to produce seeds in this country.—*Bot. Reg.*

Echeve'ria acutifólia. Sharp-leaved Echevéria. (*Greenhouse Succulent.*) Crassuláceæ. Decándria Pentagýnia.—Among the novelties found by Mr. Hartweg during a short visit to Oaxaca, in Mexico, was this pretty plant, whose succulence and tenacity of life enabled its stems to reach Europe alive. When it was first received by the Horticultural Society, it was mistaken for E. gibbiflora; but upon flowering it proved to be very different, and much more handsome. It differs from that species in the leaves being acute, greener, and more richly touched with scarlet. The flowers are disposed in a short narrow erect cylindrical panicle, and they are rich scarlet tinged with yellow. The lateral branches are short, straight, and only bear three or four flowers in a corymbose manner at the end.—*Bot. Reg.*

Oncidium sphacelatum. Scorched Oncidium. (*Stove Epiphyte.*) Orchidáceæ, § Vandeæ. Gynándria Monándria.—Among the new species of Oncidiums this is one of the most beautiful yet known; and has been sent from Guatemala by Mr. Skinner to his friends; by Mr. Hartweg from the same country and Mexico to the Horticultural Society, and from Honduras to Messrs. Loddiges, with whom the species first flowered in February 1841. There are two varieties in cultivation, one much handsomer than the other, with larger flowers.—*Bot. Reg.*

Cirrhope'talum chinense. Chinese Cirrhopétalum. Orchidáceæ. Gynándria Monándria. (*Stove Epiphyte.*)—There is no longer any occasion for speculative minds to occupy themselves with the important investigation of the cause that may have led the Chinese to invent strange figures of men and women, with their chins in perpetual motion, for here is the explanation of it. We have here a plant from China, one of whose lobes is exactly like a tongue and chin, and so unstable as to be in a state of continual oscillation. The flowers are very large for the genus, in general appearance like those of C. maculatum. The petals and upper sepal are purple, the lateral sepals are yellowish green. The flowers are arranged in a circle, and all look outwards; so that on whatever side the umbel is regarded, it still presents to the eye the same row of grinning faces and wagging chins. Messrs. Loddiges imported it from China.—*Bot. Reg.*

Oncídium nanum. Dwarf Oncidium. Orchidáceæ. Gynándria Monándria. (*Stove Epiphyte.*)—This singular plant has the habit of O. púmilum, to which it is nearly allied. It differs in having much larger flowers, and in the form of its lip, which is varnished, as it were, and bears two large warts, one transverse and one longitudinal, placed at right angles to each other. The form of the wings of the column is almost that of a straight knife-blade directed downwards, and tipped with a lucid gland. Messrs. Loddiges obtained it from Guiana.—*Bot. Reg.*

A'nia bicornis. Two-horned A'nia. Orchidáceæ. Gynándria Monándria. (*Stove Epiphyte.*)—A singular plant of the Orchidaceous order, imported from Ceylon by the Rev. J. Clowes. It has something the appearance of Eulóphia macrostáchya; the flowers are green, except the lip, which is bright yellow.—*Bot. Reg.*

E'ria acutifólia. Acute-leaved E'ria. Orchidáceæ. Gynándria Monándria. (*Stove Epiphyte.*)—A small unattractive species, imported from India by Messrs. Loddiges. Its leaves are fleshy, deep green, very acute, and between 2 in. and 3 in. long; the raceme is erect, composed of five or six distant flowers, of a dirty white, with violet veins. The lip has a purple base, and a dull yellow tip.—*Bot. Reg.*

E'ria paniculata. Panicle-flowering E'ria. Orchidáceæ. Gynándria Monándria. (*Stove Epiphyte.*)—Specimens of this plant have flowered with Messrs. Loddiges. They have long narrow taper-pointed leaves, and panicles of small greenish flowers slightly freckled with purple; having a line of fine white powder formed all along the middle of the lip, and burying the tubercle, which occurs at the base.—*Bot. Reg.*

Hóvea racemulosa. Short racemose Hóvea. Leguminosæ. Monadélphia Decándria. (*Greenhouse Shrub.*)—This is a pretty greenhouse shrub, raised by R. Mangles, Esq., of Sunning Hill, from Swan River seeds obtained by Capt. James Mangles. It has narrow leaves, brown underneath, and short axillary racemes of pale purple flowers.—*Bot. Reg.*

Isopogon róseus. Rose-coloured Isopogon. Proteáceæ. Tetrándria Monogýnia. (*Greenhouse Shrub.*)—A handsome Swan River shrub, raised by R. Mangles, Esq., from seed imported by Capt. J. Mangles, R.N. It has a rather glaucous rigid foliage, deeply divided into three lobes, which are themselves 3-cleft or 5-cleft, and spiny-pointed. The flowers are reddish purple, in cones surrounded by the leaves at the end of the branches.—*Bot. Reg.*

Cy'tisus Welde'nii. Welden's Cýtisus. Leguminosæ. Monadélphia Decándria. (*Hardy Tree.*)—This plant is now in flower in the Garden of the Horticultural Society, and proves to be very different from the Scotch Laburnum, notwithstanding its foliage, which much resembles that species. Its flowers are sweet-scented, growing three or four together in an upright, not drooping cluster. It is a small tree, from the mountains of Dalmatia, hardy, and worth adding to the collections of Trees and Shrubs. The poisonous qualities of Laburnum seeds is said to be much concentrated in this plant, and the scent of the flowers produces headache.—*Bot. Reg.*

MISCELLANEOUS.

Climate of Ladakh.—Frost, with snow and sleet, commences early in September, and continues with little intermission to the beginning of May. From the middle of December to the beginning of February we found the thermometer, out of doors at night, seldom above 15°, and on the 1st of February it was as low as 9½°. In an inner apartment of our dwelling, it ranged from 23° to 32°, but did not rise above the freezing point till the 8th of February. In May, the days become warm, although early in the morning the rivulets not unfrequently present a coat of ice; and this may be observed in some spots even in June, whilst on the loftiest mountains snow falls occasionally every month in the year. During the summer months, the sun shines with great power, and for a short part of the day his rays are intensely hot. At Lé, on the 4th of July, the thermometer in the sun rose at noon to 134°, and on the march to Piti it stood 10° higher; at night the temperature was 74°. Even in the depth of winter the heat of the sun is very considerable for an hour or two, and the variation of temperature is consequently extreme. On the 30th of January the thermometer showed a temperature of 83° at noon, when it was only 12½° at night. The great heat of the sun in summer compensates for the short duration of the season, and brings the grain to rapid maturity. Barley that was sown in the neighbourhood of Lé on the 10th of May was cut on the 12th of September; and at Pituk, five miles from Lé, and about 800 feet lower, the same grain is ready for the sickle in two months from the time of sowing. The atmosphere of Ladakh is in general dry, the moisture being converted into snow in the winter, and speedily evaporated by the scorching suns of summer; there is consequently very little rain. During our stay in the country, rain fell but on ten days, and then in very small quantities, between the end of April and the middle of September; and this we were informed much exceeded the average fall.—*Moorcroft's Travels*, vol. i, p. 267.

To Prevent Hay from Heating.—M. Schattenmann of Bouxwiller, in Alsace, of whose manner of preparing stable manure we some time since gave an account, (p. 191), states, that he prevents the heating of haystacks by the following simple means:—In making the stack he sows over the hay 200 grammes of muriate of lime for every quintal of hay, at a cost in France of only a penny per quintal. He says that he has found this so effectual, that for 15 years he has seen no case of fermentation taking place in the stacks when it has been used, and that he is in fact indifferent about adding to his stacks a few loads of damp hay; for he is satisfied that the muriate of lime completely neutralizes the dangerous effects of moisture.—[The salt and lime now so much used by farmers is an imperfect kind of muriate of lime. The salt itself is very cheap.]

Apricots of Ladakh.—Of these there are said to be ten varieties; and they certainly present much difference in size, shape, flavour, colour, and surface. They are all raised from the stone, with one exception, which is supplied by inoculation. This is a small fruit, not much larger than a walnut, somewhat flattened at the bottom, of a glossy skin, and pale yellow colour, inclining to white, which changes to a reddish brown where it faces the sun. The pulp is of the usual consistence next the skin, but becomes softer as it recedes, and next the stone is little thicker than honey in the comb. The whole fruit partakes of the lusciousness of honey, combined with a slight and agreeable bitterness, and the flavour is unsurpassed by any variety of apricot I have ever met with. The stone is of a light yellow colour, approaching to white. The trees grow in the Pargana of Ladakh Proper, and especially at Saspula, not far from Lé, on the banks of the river. There are two other kinds, which might perhaps be advantageously introduced into European horticulture. One has a smooth, shining surface, without down, is round, and of the size of a greengage, and holds, both in appearance and taste, a middle station between an apricot and a plum. The third is a little larger than the preceding, with a short down on the skin, which is of a redder colour. The stones of both these kinds are of a dark brown, bordering on black. The other varieties are deficient in juice and flavour, acid, or mealy, and are only fit for drying and preserving. The trees blossom in April and May. Much fruit is gathered in August, but the season is not over before the end of September. The greater part of the fruit is dried in the sun, in which state it remains good for many years; and is stored for home consumption, or exported to Lassa and Tartary. The dried fruit has a mixture of sweetness and sub-acidity, and is a wholesome and palatable article of diet. An oil, used as a perfume, is extracted from the apricot kernels.—*Moorcroft's Travels.* Vol. i., p. 295.

Cyclamens.—The following account of the European Cyclamens, which are excessively confused alike in books and gardens, I owe to the kindness of the Hon. W. F. Strangways, who has studied the genus with great attention for many years. It will enable our botanical friends to set their herbaria in order now for the first time. "I have seen all the European species (except some doubtful ones) native in Italy, and cultivated them for many years. The result is, that I believe there are but three good European species. We must begin by dismissing names from our consideration. These three are all European, all more or less ivy-leaved; accordingly all are to be found classed under those appellations. But there are at least three distinct species, so that besides the mistake of a name, there is also a confusion of plants. For this reason Professor Tenore, of Naples, who first distinguished the three, distributed the names as follows:—1. He gave to the Northern, Alpine, summer-flowering Cyclamen, the name europæum, as the plant of Linnæus, and probably with reason. 2. To the Southern, Mediterranean, spring-flowering plant, the name hederæfolium, as being the plant so named by Clusius, who I think describes it as "Cyclaminus hederæ folio verno tempore florens." 3. What was to be done with the plant of middle Italy, which all previous botanists had seen, but none had distinguished from the two others? He rightly judged it to be a distinct species, and like most Italian botanists, to honour his own town, gave it the name under which it is published, viz. neapolitanum; though No. 2 is equally common there, and less common elsewhere, and, had not Clusius named it, would have made a better neapolitanum. I have found C. europæum always fragrant, flowering in Austria in July and August, and as late as September—on the Italian side of the Alps, in the Friuli—never south of the Po. Tenore's C. neapolitanum is common over all Italy, south of the Apennines of Bologna. I am told it is not found at Genoa or to the westward, but that it is in Sicily and North Africa; and now it seems on one mountain near Sion in the Valais, and in Kent and Suffolk. The white variety of the gardens I refer to this, but never found it wild. This seems to me C. latifolium of Fl. Græca. The northern limit of C. hederæfolium of Clusius is, as far as I know, the northern slope of the mountain of Spoleto, where I found it as late as the end of May. In the low and more southern countries of Italy, it begins to flower in March. It is always fragrant, but with a less delicate scent than the others, but of a finer colour, and a flower in shape nearer to C. persicum. It seems the same as the C. repandum, Sibth., of Greece. Cyclamen vernum of the gardens seems intermediate between C. coum and neapolitanum, but I judge only from the figure, not knowing its history. C. lineare is, I believe, now considered fabulous. Mr. Bentham has heard of a white spring Cyclamen near Montpelier, which has never, I believe, been determined. The leaves of No. 2, C. neapolitanum, differ greatly on different plants, not on the same. I have only found it fragrant near Naples, and then sweeter than No. 3."—*Botanical Register.*

New Cactus.—We have just received from J. D. Llewelyn, Esq., of Penllergare, the flower of an exceedingly handsome seedling Cactus. It was raised from the seed of Cactus speciosus, fertilised with C. Ackermanni, and appears to partake of the character of both parents. The flowers, which are produced freely, are of a beautiful rose colour; the sepals measure about four inches across, while the interior petals, instead of expanding, as in other flowers of this genus, are contracted, and form a tube about 1½ inch in diameter. The peculiar form and bright colour of the blossoms render this quite distinct from any variety hitherto raised.

Instances of Autumnal Heat.—We may expect, from the state of the soil in September, to have it warmer weather than the length of the day would otherwise produce; but in some years September and October have been noted for very unusual extremes. On September 7th, 1795, the thermometer in Suffolk was 89°! wind S.E. —In 1804, for many days in September, especially the 4th, 5th, 13th, 14th, 15th, and 16th, intense heat prevailed; and on Sunday the 16th, the temperature was 86° or 87° in several places in Suffolk! wind also S.E.—On October 15th and 16th, 1811, the thermometer was 73°! September 16th, 1815, 80°; and in September and October 1819, there were some days of great heat. The month of September in 1810, 1811, 1820, and 1824, also afforded a very high temperature on some days, but at earlier periods, and therefore less remarkable; but so late as the 25th and 26th, in 1832, my thermometer was 80°, and the same on 19th September, 1834. On October 6th, 1834, it was at 77°, and wind S.E.—*Meteorological Journal.*

Reviews.

The Quarterly Journal of Agriculture, No. 57. June, 1842. Blackwood.

THIS number maintains the high reputation that has been acquired by previous parts, even without the valuable Transactions of the Highland Society, which appear along with it. The first article is by Mr. Cuthbert Johnson, upon the organic chemistry of the eighteenth century. The following extract from Evelyn is curious, as showing the views he entertained upon the subject of saline manures:—

"It is salts which entice roots to affect the upper and saline surface of the earth, upon which the nitrous rains and dews descend, and the cause that some plants, the most racy and charged with juice, of all other (for such is the pine) thrive so well among rocks and pumices, and in whatever best maintains this vital pickle. It is salt which makes all covered and long-shaded earths to abound in fertility, and renders the dung of pigeons, poultry, and other salacious corn-fed birds, so eminently effectual before the soil of horses and other beasts, in which it less abounds, as having less virtue to attract it. It is salt that gives such vigour to places sprinkled with urine, soot, ashes, &c., which have them not diluted; and to bones, flesh, horn, hair, feathers, blood, and the rest of those animal excrements. And whence those seminal masses should proceed after calcination of the earth, when it comes to be exposed again, is hard to divine; whence, I say, they should derive their life and energy, without being destroyed by so powerful an agent as fire, unless they lurk in some vegetant and indissoluble salts (volatile, fixed, or nitrous earth) from whence they (phœnix-like) emerge, though I do not say without any other specific rudiment; but it is strange what, as I remember, Dr. Morrison affirms of the Erysimum or Iris, so seldom seen to grow spontaneously in England before the late prodigious conflagration of this city, when there appeared more of it amongst the ruins than was known to grow in all Europe besides, it being a curious exotic, to be found most about Naples in the time of Fabius Columna, and but rarely elsewhere. It is salt which resuscitates the dead and mortified earth, when, languishing and spent by indulgence to her verdant offspring, her vigour seems to be quite exhausted, as appears by the rains and showers which gently melt into her bosom what we apply to it, and for which cause all our composts are so studiously made of substances which most engender or attract it. It is salt which fertilizes and renders Egypt so luxuriously fruitful after the inundations of the Nile; and the nitrous grounds of Jamaica and other places cause a stupendous growth of plants and trees. It is the want of salt which emasculates the virtue of seeds too long macerated in hungry water, and renders floated wood such unprofitable fuel, and to turn into such insipid ashes; and whatsoever it be some plants may appear to affect, as to the external differences of appetite, some of them seeming to draw in more air, some earth, and others water in extraordinary measure, according to the several contextures of their parts, or by whatever magnetisms and attractives, it is still to come at their salts, which doubtless create that inclination, and compose the various saps and juices which they present us. Nay, what if I should say that all the several parts of vegetables were endowed with their peculiar and distinct salts, through different motions, complications, and percolations? Or that so many earths, so many kinds of salts digested and transported by their different vehicles and strainers; and those also, though unlike in quality, yet perfectly congruous to what they produce and nourish? But what this vehicle or menstruum is, I contend not. It is evident that salts unite best with water, vernal and autumnal showers and dews, as the most apt to convey their insinuations. You know who have dignified salt with the prerogative of being named element-earth, the vigour and close of all things; yea, the first and last of elementated bodies. What shall I say, *quid divinum!* the original of all fecundity; nor can I say less, since there was no sacrifice or discourse without it. And verily, upon serious contemplation of the premises, and the little experience I have had of their effects in this work of vegetation, as far as I am able to penetrate into causes by them, I am not displeased at the magnificent epithets which are given it. In the mean time, I know there be who are so averse to this doctrine, as to prefer water alone before it: nor contend I with them, so they allow the near affinity and friendship which is between them, as I have deduced it at the entry of this discourse, where I describe my autoptical observations of the several earths; all that I pretend from hence being only to excite us to make diligent inquiry what may more likely be the cause of vegetation, and whether salt have not a dominion almost mechanical in this great work of Nature, being so absolute an ingredient in all our dungs and composts. I cannot, in the mean time, but wonder how a thing so eminently sacred and fertile should come to be the symbol of malediction; when, as the custom was, they used to sow salt in the place of cities they had erased and cursed; there being in all nature nothing so pregnant and fruitful, unless it were to invite the plough to go there, and that the fertility of the spot for corn and grain might divert them from rebuilding and covering it again with houses. Indeed, to apply salts in excess burns the earth for a time, so as nothing will grow upon it; but when once the rains have well diluted it, vegetables spring up more wantonly than ever. This I daily find, by sifting common salt upon the gravel-walks of my garden; and for which cause I have left it off. And we find that the earth itself, overwashed and too highly manured, is as unprofitable as if it were barren for the time, and that there is in all things a just proportion to be observed."—(pp. 49—52.)

The second paper is upon Trigonometrical Surveying and Levelling, by Mr. W. Galbraith, who points out the errors in old surveys, and offers some excellent advice to the officers charged with the Ordnance survey of Scotland. He particularly insists upon the importance of accuracy in the names of places, and points out some striking inaccuracies that have found their way into books. Take, for example, Dunoon:—

"It is supposed by some to be derived from the Gaelic word Dun, a castle, and Nuadh, new; and hence Buchanan, in his Latin 'History of Scotland,' writes it Noviodunum, Newcastle. By others, it is derived from Dunoighean, the castle of virgins; by others, Dun-Owen, Owen's Castle, &c. All these seem to me to be caused by needlessly wandering from the point, straining to seek some important derivation, when none, in my opinion, is necessary. To one like me, not very much initiated in Celtic lore, it appears to be derived simply from Dun-Uaine in Gaelic, signifying, in plain English, Greenhill, exactly descriptive of the little green hill on which the castle formerly stood. The same or similar observations may be made on many learned disquisitions on Highland etymology. A ludicrous instance of the same kind is committed by Messrs. Sedgwick and Murchison, in their geological survey of Arran. They describe a rock which they write Craig-a-cajou, and translate—a mountain of cheese; whereas the true orthography is, Greag-a-caise, the very steep rock. Even an investigation of this kind in England would be interesting to philologists and antiquarians. For example, Dover, in Kent, is compounded of two words, radically Celtic, namely, Dha, two, and Barr, a height; hence a Celt would infer that there are two heights or cliffs at Dover. In fact, this appears to have been the British pronunciation nearly, in the time of the Romans, who wrote it Dubræ, Dubris, &c. In like manner, Calais, in French, is synonymous with Caolas in Gaelic, signifying a strait or ferry. Hence Calais is the town on the ferry between France and England."

This is succeeded by Hints for the Improvement of Agriculture, by Mr. J. Hannam. He points the folly of tenants hiring farms without capital enough to manage them, or of taking them from year to year under any circumstances; a measure which Mr. H. thinks equally prejudicial to landlord and tenant. He objects, too, to the introduction of stringent covenants into leases, which "merely retard and annoy the good farmer, and rarely improve the unskilful." And he attributes the superior condition of the Scotch tenantry over the English to the length and freedom of their tenures, and to their *corn-rents saving them from the effect of low prices.*

An entomological article follows, from the pen of Mr. Duncan. It relates to the history of the Black-veined White Butterfly, and some other species, whose habits are illustrated with good wood-cuts.

Among the papers furnished by the Highland Society is a very long Geognostical account of Banffshire, by Mr. Cunningham; some excellent remarks upon the improvement of Oats growing in moss, by Prof. Johnston; upon top-dressing with bones and lime, by Mr. Campbell Smith; upon new fertilising substances, by Mr. Oliver; and upon the comparative value of bone-dust and rape-cake, by Dr. Madden. In Mr. Johnston's experiments, the best effects upon Oats grown in peat-moss was obtained by a dressing of bone-dust and lime, which supplied the earthy matters that peat soil is always deficient in. In other cases he recommends the addition of ashes containing silica, as a sure means of improving fresh soil, especially wood-ashes, soap-boiler's ash, peat-ashes, and kelp; especially the second and fourth. He also advises the powder obtained by crushing the white slag of iron furnaces, in those places where it can be had. "The practical conclusions," says Professor Johnson, "at which we seem to have arrived are, that the phosphate of lime (earth of bones) and magnesia are likely to aid the filling of the ear; and that kelp, or Dutch, or wood ashes, will probably benefit the straw. The following mixture seems likely to supply these and all other deficiencies of the soil for this crop—supposing the land previously drained and limed, or perhaps partly slagged.

1 cwt. kelp or Dutch ashes, . . .	£0	4	0
½ cwt. nitrate of soda, . . .	0	12	0
½ cwt. dry sulphate of soda, . . .	0	5	0
5 bushels of bone dust, . . .	0	10	0
¼ cwt. (epsom salts) sulphate of magnesia,	0	2	6
Total cost,	£1	11	6

Mr. Smith states that the effect of draining and top-dressing with bones and lime some rough swampy land overrun with rushes and bad herbage, was as follows :—"Previous to the top-dressing, the 51 acres were considered to be worth 24*l*. The park is now estimated to keep well, during 6 months, 53 six-quarter-old cattle, which, state only at 20*s*., or 53*l*., besides affording good wintering to at least 80 sheep at 2*s*., or 8*l*., in all 61*l*., leaving an increased annual value of 37*l*., which will repay the outlay in less than 6 years, or, in other words, supposing the previous rent of 24*l*. to be worth thirty years' purchase, or 720*l*., the present, at the same rate, is worth 1830*l*., thereby increasing the value of the property 1110*l*., by an expenditure of only 207*l*. 8*s*. 7*d*. The result altogether has been so satisfactory, that I have been preparing to follow a similar plan with a much larger extent. The lime appeared to do much more good than the bones, which ought to have been mixed with the earth for a much longer period ; but it is probable that the bones may have a better future effect. Unless completely decomposed, they should not be applied where there is not a considerable sward, and then they produce a wonderful benefit and a very rapid growth. On the stunted moor the bones had no apparent effect, and the lime not much the first year ; but now (1841) the heath is disappearing and the natural grasses are coming up abundantly."

Dr. Madden finds that a ton of bone-dust or rape-dust is equal, in the production of turnips, to 15 or 20 tons of well-prepared farm-yard manure. "Chemical analysis has now proved that a ton of bones is equal to 30 tons, and one of rape-dust to 18½ tons, of farm-yard manure! Where is the necessity for comment? and who will now doubt the efficacy of chemistry for the purpose of unravelling the mysteries of practical agriculture!"

CALENDAR OF OPERATIONS *for the ensuing week.*

In such weather as we have lately had, watering and keeping down weeds constitute the principal work of the garden; it is useless to think of planting, unless rain should occur. To make apparent the enormous quantity of water perspired by plants in hot and dry weather, it may be mentioned that an eminent physiologist ascertained, by experiment, that a Sunflower, whose evaporating surface measured 5616 square inches, transmitted from the soil into the atmosphere no less than 30 oz. of water in the short space of 12 hours. (See Lindley's "Theory of Horticulture," page 47.) To furnish this immense drain of fluid, recently-removed plants possess only a small and mutilated system of roots, which must necessarily be dependent for a supply of moisture upon the limited portion of ground with which they are in contact; or, in the case of plants turned out of pots, the old ball and the soil touching its sides are the only sources of moisture until the roots have ramified into the surrounding earth. The necessity of regular and copious waterings in dry weather to such plants will, therefore, be evident; and, as much labour is thereby incurred, it will be advisable, by way of economising time and water, to adopt the practice of covering the ground round the stems after watering, in the way mentioned at p. 288.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—In very hot days the plants in pits will be benefited by shading; not, however, with thick mats so as to keep them almost in darkness, which is often done, but by means of netting, or coarse canvas, or any other material which will obstruct, without excluding the sun's rays. Take care that the lately-renewed beds do not heat too strongly. When they exceed 95° it is time to adopt precautionary measures. Keep the atmosphere of the houses humid by damping the surface of the bark-beds, the paths, and the walls, and by gently syringing the plants every evening when the air is taken away. Of course fires are not required now, and in warm nights it will not even be necessary to cover the pits.

Vinery.—As the Vines in the first house are cleared of fruit, wash them well with a syringe, in order to get rid of the Red Spider, for the production of which the late dry and hot weather, and the necessary cessation of syringing while the fruit was ripe, have been peculiarly favourable. Make the floors of the later houses frequently damp in hot days, when the evaporation will tend to cool the atmosphere, and to moderate perspiration by the leaves. These Vines should be syringed, but not roughly, every afternoon. Give air betimes in the morning.

Peach-house.—After the crop is taken, Peach-trees are too often treated as though they no longer required or deserved attention; but this is a great error. The leaves, which have hitherto been occupied in elaborating sap for the support of the fruit, are now no less requisite for the purpose of preparing and depositing in the tissue of the wood the secretions necessary to its perfect formation, and in perfecting the flower-buds for next season; consequently it is of the utmost importance to preserve them in a healthy condition up to the period of their natural decay. The same attention ought, therefore, to be bestowed upon the trees now as they received while the fruit was growing, in regard to keeping the foliage free from insects, and giving regular supplies of water and air.

Cherry-house.—The latest forced fruit will by this time probably be all gathered, when the trees should be removed to the open air, and afterwards regularly attended to with water.

Fig-house.—Take care that the second crop is not endangered by withholding water from the trees upon which there is ripe fruit. Any trees, from which the ripe Figs are all gathered, should have a good watering with liquid manure; the leaves should likewise be copiously syringed.

Cucumbers and Melons.—Continue to plant out for late crops as Potatoe and other frames become vacant. It will not be necessary to make new hotbeds, but provision should be made for heat being thrown into the old ones, by means of linings, in case bad weather should occur at the time the fruit is swelling. For the latest crop seeds of some early variety may yet be sown. Shade the plants in the heat of the day, and sprinkle them when the frames are closed in the afternoon. Night-coverings may be dispensed with if the weather continues fine. Ridge Cucumbers under hand-glasses must be attended to in shading and watering.

Out-door Department.

Broccoli.—Water the seed-beds which are to furnish plants for the latest crop; these must not be allowed to get stunted.

Cabbages.—As the heads are taken for use, cut off the remaining leaves and let the stalks stand to produce sprouts.

Cauliflowers.—Water these freely, especially the plants on south borders, which are now coming into use. Shade the young heads from the sun.

Celery.—Do not neglect the regular watering of the transplanted crops; if checked, it will most likely run to flower. Prick out the later plants on dung, in the way formerly recommended, and shade them in hot sunshine.

Kidney-beans.—Sow a dwarf sort for a late supply; these should be put upon a south border, or other warm situation, where they will bear till destroyed by frost. Water the drills well before covering the seeds. The transplanted crops, particularly those at the foot of a wall, should have a good soaking of water, if the dry weather continues.

Lettuce.—Tie up Cos once every week or ten days.

Onions.—Keep the ground stirred between the rows, and water those which have been transplanted. Break off the flower-stems from the autumn-sown plants, and likewise from Garlic and Shallots.

Radishes.—Sow more frequently now, and always on a shady border.

Orchard.—If it is an object to have fine Strawberries, the plants must be well watered in dry weather, before the fruit ripens. Cover the best beds with nets to preserve them from the birds. Proceed with the pruning and nailing of wall-trees, and take pains in training those young shoots quite straight, which are meant to form future branches. There is much to learn respecting the summer management of wall-trees, upon which their productiveness in a great measure depends. Where there are wide spaces between the main branches of luxuriant trees, nail in as many young shoots as there is room for; these will make future bearing wood. Cherry-trees should be pruned and nailed, and well washed preparatory to netting them. Use the engine freely upon Peach-trees.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Re-pot winter flowering plants, which are now growing rapidly, and stop the shoots of such as Euphórbia Jacquiniflora, to make them bushy specimens. Many of the Orchidaceous plants will now be forming their young shoots, particularly those in the cool house, which are natives of Mexico; it should be kept in mind that this is a critical time, as the young leaves are very easily rotted with too much water. Continue to propagate by cuttings, &c.

Greenhouse and Conservatory.—Attend carefully to the watering, staking, &c. of plants which have been set out of the house, and notice particularly, as they grow, that they are not crowded too close together, especially Heaths, which will not thrive either in or out of doors in a close and stagnant atmosphere. If mildew is observed upon these, remove them to a more airy situation (but not where fully exposed to the burning sun), and dust the foliage well with sulphur. Broken clinkers, covered with coal ashes, make a capital bottom for these and other delicate rooted plants to stand upon. Dress and tie the climbers in the conservatory, and see that the plants in the borders do not suffer from want of water.

Pits and Frames.—Fuchsias (with the exception of fulgens), and all similar plants intended to make large specimens, must be attended to in potting when necessary, and tying into a regular form as they advance in growth. Shift Chrysanthemums before they become pot-bound, or the loss of foliage will be the consequence. Some plants may be turned out into an open border, where, if attended to in stopping or tying, they will form handsome bushy plants to be re-potted in autumn. To obtain dwarf plants, layer the points of the shoots, and transfer the young plants to pots after they are rooted.

Out-door Department.

Watering must not on any account be neglected, so long as the present drought continues. Stake and tie all plants, before they acquire an ill shape for want of it. Climbing plants on walls, arbours, or poles, will now be growing rapidly, and will often require tying or nailing. Destroy the seed-vessels of Tulips and other bulbs; and if the ground they occupy is wanted, they may be taken up, and the roots laid in sand till the leaves decay. Where mowing is not indispensable, it had better be deferred till after rain.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Small seedling plants will be greatly assisted by occasional waterings; and if not inconvenient, it would be advantageous to the tender plants, to adopt some contrivance for shading them in hot and dry weather. Keep the ground stirred between the rows of young trees.

Forest and Coppice Woods.—Where there are regular men kept in this department, they might now be advantageously employed in trenching and preparing ground for planting in autumn.
—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending June 9, 1842, as observed at the Horticultural Garden, Chiswick.

June		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	3	30.296	30.160	76	42	59.0	N.W.	
Saturday	4	30.112	29.965	82	48	65.0	W.	
Sunday	5	29.953	29.809	80	48	64.0	E.

Tuesday	7	30.217	30.163	78	51	64.5	N.E.	
Wednesday	8	30.244	30.204	81	47	64.0	N.E.	
Thursday	9	30.218	30.103	76	49	62.5	N.E.	
Average		30.154	30.045	62.9	46.5	62.9		.00

June 3. Cloudless in the morning; very dry; light clouds; clear at night.
4. Clear, hot, and excessively dry; fine at night.
5. Fine, with light clouds; hot and dry; lightning in the evening; cloudy.
6. Fine, with slight dry haze; hot and dry; cloudy.
7. Slight dry haze; hot and dry; clear.
8. Fine, with light clouds; hot and dry; clear.
9. Fine; hot and dry: clear and fine at night.
Mean temperature of the week nearly 5° above the average.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending June 18, 1842.

June.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
							N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 15th, in 1836—thermometer 86°; and the lowest on the 15th, in 1841—thermometer 36°.

REPORT ON COVENT GARDEN MARKET,

For the week ending June 10, 1842.

Owing to the continued fine weather, both fruit and vegetables have been abundantly supplied during the past week, but trade has not been so brisk as in our last report. *Fruit.*—Pines are plentiful and of good quality, at the prices quoted last week. Grapes are abundant, the Black Hamburg, Frontignan, and Sweetwater selling from 3*s*. to 8*s*. per lb.; and the White Muscat at 10*s*. per lb. Melons are not scarce; the kinds offered are the Green-fleshed, Cantaloupe, and Black Rock, from 3*s*. to 8*s*. each. Peaches and Nectarines continue nearly the same, but Cherries have fallen to 3*s*. and 8*s*. per lb. Strawberries are exceedingly abundant, and are selling from 6*d*. to 2*s*. per pottle. Gooseberries and Currants are somewhat cheaper than in our last account, the former fetching from 2*s*. to 3*s*. per half sieve; the latter from 2*s*. 6*d*. to 3*s*. per half sieve. Apples are almost over; a few Gooseberry Pippins are selling from 8*s*. to 10*s*. per bushel, and some French Crabs, from 6*s*. to 8*s*. per bushel. Cucumbers are plentiful, from 6*d*. to 2*s*. per brace. *Vegetables.*—Asparagus is much cheaper and more abundant than it has hitherto been; the best selling from 2*s*. 6*d*. to 4*s*. per bunch. Cauliflowers are not quite so good, owing to the dry weather; they are selling from 2*s*. to 6*s*. per doz. Peas are becoming somewhat plentiful, from 5*s*. to 6*s*. per bushel, and from 11*s*. to 12*s*. per sack. New Potatoes are considerably cheaper, and are selling from 3*d*. to to 9*d*. per lb.; the Cornish ones from 2*s*. to 3*s*. 6*d*. per doz. lbs. Young Carrots and Turnips continue the same as last week. Lettuces are plentiful and fetch from 6*d*. to 1*s*. 3*d*. per score. French Beans are much cheaper, having fallen to 1*s*. and 2*s*. per 100. A few Artichokes are to be obtained, which are selling from 5*s*. to 8*s*. per doz. Rhubarb is nearly past; there is still, however, a considerable quantity, from 4*d*. to 9*d*. per bundle. Mushrooms are rather scarce, from 1*s*. to 2*s*. per pottle. *Flowers.*—Amongst these we observed some fine Ericas, Ixias, Clematises, Cactuses, Yellow Roses, Sweet Peas, Kálmias, Carnations, and Picotees.

PRICES Saturday, June 11, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* 6*d* to 6*s*
— Dessert, per bushel, 5*s* to 12*s*
Strawberries, per pottle, 6*d* to 2*s*
Peaches, per doz. 12*s* to 24*s*
Nectarines, per doz., 12*s* to 24*s*
Pine Apple, per lb. 5*s* to 12*s*
Grapes, per pound, 3*s* to 8*s*
— Muscats, per pound, 10*s*
Oranges, per doz., 1*s* to 2*s* 6*d*
— per 100, 6*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Cucumbers, per brace, 6*d* to 2*s*

Melons, English, each, 3*s* to 8*s*
Cherries, per lb. 3*s* to 8*s*
Gooseberries, per hf. sve., 2*s* to 3*s*
Currants, per half sieve, 2*s* 6*d* to 3*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Walnuts, per bushel, 16*s* to 24*s*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, per doz. 1*s* to 2*s*
Cabbage Plants, per doz., 2*s* to 4*s*
Broccoli, Brown, p. bnch., 8*d*
Cauliflowers, per doz., 2*s* to 6*s*
Peas, per sieve, 4*s* to 5*s*
— per half sieve, 2*s* to 2*s* 6*d*
— per sack, 16*s* to 20*s*
— Prussian, per sieve, 6*s* to 7*s*
Kidney Beans, forced, p. 100, 1*s* to 2*s*
Potatoes, per ton, 50*s* to 80*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
— New, per lb., 3*d* to 9*d*
Artichokes, per doz., 5*s* to 8*s*
Turnips, White, per doz. bun., 3*s* to 8*s*
Carrots, per doz. bunch, 4*s* to 15*s*
Red Beet, per dozen, 1*s* to 2*s*
Horse Radish, per bundle, 2*s* 6*d* to 7*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Spinach, per sieve, 1*s* 6*d*
Chives, per pot, 3*d*
Leeks, per dozen bunches, 1*s* to 2*s*

Garlic, per bunch, 4*d* to 6*d*
Shallots, per bch., 3*d* to 4*d*
Onions, Old, per half sieve, 4*s* to 5*s*
— Green, per doz. bch., 2*s* to 2*s* 6*d*
Asparagus, per 100, large, 2*s* 6*d* to 4*s*
— Second or Middling, 1*s* 6*d* to 2*s* 6*d*
— Sprue, or Small, 1*s* to 1*s* 6*d*
Lettuce, Cabbage, p. score, 6*d* to 1*s* 3*d*
— Cos, 6*d* to 1*s* 3*d*
Celery, per bundle (12 to 15) 6*d* to 1*s*
— young, per bund., 1*s* 6*d* to 2*s* 6*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch. 4*d* to 6*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Tarragon, per dozen bunches, 3*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 2*s*
Mint, per dozen bunches, 2*s* to 3*s*
Marjoram, per doz. bunches, 2*s*
Savory, per doz. bunch., 2*s*
Basil, per doz. bunches, 2*s*
Rhubarb Stalks, doz. bundles, 4*s* to [illegible]
Mushrooms, per pottle, 1*s* to 2*s*

Notices to Correspondents.

Country Shows.—We intend next week, in a double number, to clear off all arrears relating to these, and shall be obliged, by any of our country friends forwarding to our office, as early in the week as possible, any reports which may have been omitted.

R. G.'s Galls upon the Sweet-briar are the nidus of some insects called Cynips; they will do no further harm to the bush, and if the twig with the moss-like excrescences be cut off, and placed in a box, or under a tumbler, the maggots enclosed in them will produce a variety of very beautiful little flies.—*R.*

Winton.—No. 1 is Curculio (Magdalis) atramentarius, and has nothing to do with the injury done to the bark of the Elm-trees that we are aware of; 2, Carabus (Dromius) meridionalis; 3, Carabus (Peryphus) littoralis; 4, Carabus nemoralis, Linn.; 5, Carabus (Steropus) madidus; 6, Cicindela (Notiophilus) biguttatus; 7, Carabus (Abax) Striola; 8, Silpha rugosa; 9, Carabus (Lopha) 4-guttatus; 10, Carabus (Amara) vulgaris; 11, Carabus (Helobia) brevicollis; 12, Pyrochroa rubens.—*R.*

An Irish Friend.—If your Conservatory is to have a span roof, why put up a back wall? Otherwise your plan is a good one; the arrangement of the stage and beds will look well.

P. W. J.—We find English-grown Tobacco answer the purpose perfectly for fumigation. Perhaps you have used the green-flowered, or white-flowered kinds, and not the red-flowered.

If *Omega* will procure a pamphlet called "A Statement of the satisfactory results which have attended Emigration to Upper Canada," he will find all the information that we are acquainted with. It was published last year.

O. C.—The destruction of your Glass by frost is exactly what always occurs where the laps are unputtied. A little water collects between the two plates of glass forming the lap, freezes, expands, and splits the glass, because the latter has not elasticity enough to yield to the pressure of the water. Circular glazing is the best, because it throws the water from the putty and sash-bars into the middle of the line of squares, and so saves the former. British sheet glass is more elastic than crown glass, and will yield to some extent; but we fear not sufficiently when small squares are used. Your best security is puttying your laps effectually.

M. W. K.—There is a good design for a Swiss Cottage in "Loudon's Encyclopædia of Cottage Architecture." Your Fuchsia which drops its flowers is probably not sufficiently supplied with water, or it may be that it is not kept warm enough.

W. Busby, Easthampstead Park.—Of your seedling Pelargoniums we think No. 1 is deficient in general form; the petals are too narrow and too long; and the white centre, intense spot, and bright rosy colour, will not compensate for this defect. No. 3: Under petals pink and slightly veined, deep rich spot surrounded with crimson, dying away gradually to the edge, which is rather cloudy; the under petals are large: it is not sufficiently distinct from some varieties already out. No. 2 resembles No. 3, with a better spot; petals broader, and altogether an improvement upon it. No. 4: Well formed under petals of a delicate rose, terminating white in the centre; the edges of the upper petals are rather uneven; the deep rich velvety spot is very fine. This is the best of your seedlings, the colours of which are rich and clear—the foliage broad and handsome; the dark in the upper petals is fine in all, and terminates with but little feathery. As the rosy colours appear to predominate in the Pelargonium, would it not be advisable to endeavour to obtain new varieties among the white, crimson, or purple kinds?

A Constant Reader.—We are afraid that a Cucumber-frame placed upon brickwork will be but a poor apology for a green-house; but we would advise you to build up the brickwork above the ground, instead of sinking it below. The damp arising from the earth in the latter case would prove a sure destruction to your plants in winter.

R. S. Y.—Your Fúchsia is one of the numerous hybrids between fulgens and other kinds, but we really cannot say by what name it is known.

Wilfred's plants are,—2, Gnaphalium arenárium; 4, Dillwýnia ericifólia; 3 has no flowers upon it; and 1 is too poor a specimen to enable us to ascertain what it is.

C. C.'s plants are,—1, Verónica officinalis; 2, Genista A'nglica; 3, Pedicularis sylvática.

P. R. W. is right. His plants are Orchis ustulata, A'rabis hirsuta, and Geum intermédium.

Polyanthus.—There are various reasons for Flowers falling from Plants just before they expand; the principal of which are either too much or too little water, or extreme dryness of the atmosphere in which they grow. As your plants are grown at a window, it is more than probable that the last of these is the true cause of your blossoms dropping off.

Civia.—Mahónias will stand out through the winter without any protection; and the berries of M. aquifolium and repens often ripen in this country. They only require the same treatment as other common border shrubs. All kinds of Roses, whether Standard or others, may be propagated by cuttings towards the latter part of this, or any time during next month. The quickest and surest method, however, is to bud them upon stocks of the common Dog Rose; the operation is very simple, and by a little practice you may ensure success. Rosa Devoniensis is not of a climbing habit, and is said to be hardy.

G. D. F.—The Strawberries you sent were handsome fruit, bearing considerable resemblance in shape to Myatt's Pine, but inferior to it in flavour, which was no doubt impaired by their having been so long packed. If the specimens sent were produced in the open air, it will be a valuable early kind, as we know of no other sorts whose fruit are thoroughly ripe before those of Keen's Seedling, in the same situation, have changed colour.

H. W. H.—The following is our opinion of your seedling Pelargoniums:—No. 1, with pink under petals, gradually terminating in white, and a rich spot in the upper petals softening to the edge, is good; but we have too many in that way. No. 2 bears considerable resemblance to the Sylph, but it wants the clear and bright appearance of that beautiful variety; this is occasioned by the ground colour of your flower not being so light, the spot not terminating so suddenly, and a deeper colour extending beyond the spot on the upper petals. The general form of your flower is not so good as the Sylph, nor are its petals so firm; in one point only is your flower superior, and that is in the spot continuing down to the vase of the petals, and showing less of the white feathery marking. No. 3; pleasing colour, but too small. No. 4; delicate pink under petals, fine dark spot terminating abruptly, with a stain of crimson only at the edge, and with little feathering at the base of the upper petals; a broad band of clear rose-colour surrounds the spot; this is the best flower. No. 5 is too small; the edges of the petals are very jagged.

Potentilla.—The specimen of Oak you sent is some variety of Quercus pedunculata. The greenhouse plant is Manúlea fœ'tida. If you will send us one of the Butterflies whose Caterpillars feed upon the Oak, we shall perhaps be able to tell you its name.

J. A. P.'s plants are Rhododendron hirsutum and the double Silene Behen.

Discipulus.—If your Graft has taken well, it will benefit it to remove all the small branches below it. By allowing them to remain they will absorb a considerable portion of the sap, which would be otherwise destined for the Grafts.

Poliouphloisbo has acted rightly in not covering the Sea-Kale which he planted in March. All the flowers should be cut off directly; if allowed to run to seed, they will exhaust the roots. The period when the crowns should be first covered must depend entirely upon when you want it for use. If required early in the spring, you may commence doing it in November. We shall be very glad to receive the results of your experiments with ammonia when you can furnish them.

A. B.—When the Pitcher-plant gets into an unhealthy state it is difficult to recover it. Your treatment seems just what it ought to have been, and the only advice we can offer is to give it bottom heat, by placing it above the flue or hotwater pipes. You ought to stop the young shoots of Euphorbia jacquiniflora and Poinsettia pulcherrima, to make them grow bushy.

φυ.—The insect is the Mole Cricket, a great pest where he is common, feeding upon the roots of seedlings, and destroying them by thousands. The "Wakefield" Nursery is, we presume, in Yorkshire; the Post-office would probably be able to discover the town.

T. L.—When Coal is distilled for the purpose of making gas, a large quantity of liquor is condensed in the purifiers; this consists principally of water, containing salts of ammonia, and a thick black fluid, called gas tar; the two fluids are quite distinct, and the tar, which is lighter than water, floats upon its surface. Gas liquor, as the ammoniacal water is commonly called, has been used with very considerable advantage, when diluted with water, as a manure. It is a strong caustic fluid; and accordingly it is found best to neutralise the ammonia which it contains with an acid, or, what comes to the same thing, by mixing gypsum with it: of course, as ammonia is an alkali, if we wish to fix it, we must add an acid, or some substance containing an acid—another alkali would be of no use whatever. It is probable, also, that gas tar might be used with good results; but as yet very little is known respecting the best mode of applying it. The tar, like the ammoniacal liquor, is of variable composition, it consists principally of carbon and hydrogen; but it is not known whether plants are able to feed on such a compound.

Jacques.—We do not imagine that a demand for Journeyman Gardeners exists in the New Colonies; such men would be more likely to find employment in Sydney, or Van Diemen's Land, or Canada. But if a journeyman gardener has sense enough to pull off his blue apron, take his hands out of his pockets, and turn them to cultivation of any kind, whether gardening or farming, he would probably find New Zealand a good berth. In all cases, zeal, industry, and good conduct will carry a man through difficulties in any country. Apply at the New Zealand House.

A. H.—Any young medical man, well educated, or any *good* country chemist, will tell you the proportions of earthy matters in your soil. It can also be done, upon the payment of fees, at the Museum of Œconomic Geology, belonging to the Commissioners of Woods and Forests, in London. We are glad to hear that you have prepared a considerable quantity of night soil, by means of wood and coal ashes, as we advised you, and that you find the process renders it quite inoffensive. It is about 5 times stronger than farmyard dung of the best quality.

J. H.—Water-Lilies are easily multiplied by their stems, which root in the mud of quiet streams and still water. You have only to get these stems up with a rake and transfer them to a new place. We would try our hand at a little Vegetable physiology had we not already simplified the matter, as far as seems possible, in the Theory of Horticulture.

A Farmer says, that about four weeks since he applied, upon two acres of grass land, 1 cwt. of nitrate of soda each acre; and upon 1 acre, 20 bushels of bone-dust: that he has since kept cattle in the same inclosure, and has lately found that the milk from cows in it will not keep throughout the day, the cream curdling as though acid had been added to it. He inquires whether this can be caused by the acid in the nitrate of soda becoming decomposed after being eaten by the cattle: and if it could arise from this cause, whether, in adding sulphuric acid to manure to fix the ammonia, it would not be necessary to keep it out of the reach of cows? He adds, that there have been heavy rains since the nitrate was applied. [We never heard of such an effect being produced on cows, and cannot suppose that the nitrate has anything to do with the milk curdling. Cattle always prefer grass treated with saline manures. Perhaps some correspondent can explain for us the cause of what is here mentioned.]

Dr. A's plant is Saxifraga Cotyledon: the true species.

J. C. L.—There are no fixed names for the mule Hippeastra; and they are so little cultivated that the traditional fancy names are hardly known, certainly not to us. We should be much obliged by a plant of the new Brugmansia, sent to 21, Regent-street.

H. H.—We now see what you mean. The tendril of a Cucumber is an abortive inflorescence; it may therefore be expected occasionally to produce flowers; the circumstances, however, which you mention, are very unusual, and not a little curious. As far as little bits without flower will enable us to judge, the plants are, No. 1, Cacália canescens; 2, Mesembryánthemum acinaciforme; 3, some Cotyledon; 4, Sempervivum arbóreum; and, 5, Witheringia solanácea.

A Subscriber.—We see no objection to your planting lime trees as a foundation for a large clipped hedge to screen your garden. Beech will also answer the purpose, or, still better, Hornbeam, which is what the French use. By all means plant in autumn.

Omikron.—The action of Laburnum seed on cattle is not known to us; it may possibly not be dangerous to them; but as the poisonous principle of these seeds is extremely powerful, it is probable that they would be fatal to animals as well as man. If green vitriol is used to fix the ammonia in manure instead of gypsum, it is better to dissolve it in water. The proportions are immaterial. You can easily ascertain whether it has fixed the ammonia, by holding a rag dipped in muriatic acid over the heap (see a leading article of to-day); do not, however, expect it to act instantly; some little time will be required for the vitriol to decompose. Of evergreen climbers nothing is so good as ivy; you may, however, cover your wall with the Pyracantha, and common Laurel, which will bear training and cutting, although not climbers.

R. C. B.—As seedsmen do not raise their own seeds, except to a small extent, it is not fair to charge them with all the errors that may be committed. The most respectable men may be deceived by those of whom they purchase their seeds for sale. In the instance which you mention the sale of Cowslip seed for Polyanthus seed must, we apprehend, have arisen from some accident. If a seedsman is in the *habit* of committing such mistakes, you should not deal with him. You have no other remedy.

R. C. K.—The Ericas which we are enabled to recognise from the specimens sent, are 1, Erica Boweiana; 3, E. Coventryana; 4, E. persoluta alba; 5, a variety of E. cúbica.

W. M. D.—The Cactus is too much like Ackermanni, and is not to be compared with Conway's Giant. Your Rose is not the Banksian, but the true old double yellow which so few persons can flower; most beautiful it is, we never saw finer specimens. The less it is pruned the better, as is generally found to be the case.

A Subscriber.—The principal points which constitute a good dish of Mushrooms are, that they should be solid, weighty, and compact; of a clean, smooth, white colour on the outside; large, (without opening,) short-stalked; and when opened, the gills should be of a bright reddish colour, and not livid or black, as is frequently the case in stale ones. The colour of the outside, however, depends much on the state of the soil in which they are grown, and upon whether they have been exposed to much light. Excellent Mushrooms may be grown in the autumn in an old Melon or Cucumber Frame, where the soil is rather loose, and exposed to the sun; but they are mostly brown and unsightly. If the soil in which you have potted your Carnations was properly prepared, they will want very little manure water. Too rich a soil is apt to make the colours run; therefore, rain water is preferable. Plants may be kept tolerably well without watering the surface of the soil in the pots, but not so well as if watered in the common manner. If the pots were plunged up to the rims, they would require very little water, and probably answer your object better; since it would require a greater quantity of water, in very dry weather, to supply the evaporation from the pots, than it would to keep the soil moist in them, and particularly if they were much exposed to the sun.

Amateurs' plants are—1. Echevéria gibbiflora; 2. Melaleuca hypericifólia; 4. Billardiera longiflora; 5. Euphórbia cyparíssias.

C. W. L. will strengthen his Strawberry plants by removing all the runners as they form, unless they are required for increase.

Clericus.—There are various remedies recommended for destroying the Onion Fly, amongst which are,—strewing powdered charcoal over the beds; watering them with a decoction of wormwood, described at p. 453 of last year's *Chronicle;* and spirits of tar. We have no doubt the latter would produce the desired effect.

Lusor.—Your plants are, 1. Lepídium Draba; 3. Draba incana; 4. Linaria triphylla; 5. apparently barren fronds of Cistópteris frágilis. Your Pansies, when they arrived, were quite dried up, and had lost their colour; you also omitted to number them, so that there is no mode of reference. The larger purple appears good; so does a blue one, with lemon coloured centre, and good eye; the rest seem to be bad in form. There is no doubt that many Pansies perish from being blown about: the stalks get injured, and they decay.

H. C. M. P.—The brilliant rose colour of your Pelargonium, with the dash of crimson in the upper petals, renders it a very showy variety; it appears also to be a most prolific bloomer: but the neck of the flower is too short, and the calyx turns back; so that when the flower is fully expanded, the petals become loose, and curl back, which throws the flower out of its proper form, leaving large spaces between the petals. This is a fatal defect.

D. D.—We recommend you to keep the following Pansies: No. 25, fine form, good substance, well-marked eye, yellow and purple; 9, rich bright purple, white centre, fine eye; 1, a young bloom that promises well, good eye, delicate lemon side petals, rich purple upper petals; 44, fine eye, delicate lemon ground, with purple mottled upper petals. The others have various degrees of merit: most are deficient in the eye, and common in appearance—not worth cultivating, as show flowers. Horatio is pretty, but appears thin.

J. Schofield.—Your Pansy is of a fine deep rich purple colour, of good form and substance.

G. T.—We wish we could say even one good word for your Pelargoniums. They however are so destitute of all the qualities of a good flower, that we cannot criticise them further, than by saying that their form is bad, their texture much too thin, and they are altogether behind the present race of flowers of this class. The same remarks apply to the Mimulus; we have several varieties as large with deeper colours.

Semper idem.—Greatly obliged, may you live a thousand years.

Cornubiensis.—As the Vesta stove is a decided improvement upon the common Arnott, we should recommend you to take that for heating your greenhouse, if you intend to have a stove of any sort. The evaporating pan should be as large as possible, so as to expose a considerable surface of water.

Ver.—Your plants are—1, Carex teretiúscula; 2, Mélica uniflora; 3, Aira flexuosa; 5, Lúzula sylvática.

H. B., Essex.—Your Pansies generally are too small, very deficient in the eye—which in many cases contain but a few lines—and commonly the flowers want substance. In a few cases the colours, as 13, 16, 19, 51, are curious; but this will not compensate for the absence of other properties.

G. B.—Your seedling Pelargonium did not arrive in good condition; the flowers that were expanded were dried up, and those in the act of opening always put on too flattering an appearance to be depended upon. It resembles Matilda in the delicacy of its pink, and in the spot which runs down to the base of the upper petals: we fear the lower petals are too long. The flowers were so dry that we cannot speak with certainty to this point. Probably the curling of the petals of your flowers arises from their being too much exposed to the sun; a gauze, or thin cloth shade, might remedy this.

Winton's Ferns are—2 and 6, Cistópteris frágilis; 3 and 12, Asplénium filix fœ'mina, in different stages of growth; 7 and 11, Aspídium filix mas: 8, 9, and 10, Aspidium aculeatum. The Campánulas are 1, C. glomerata; 2. C. speciosa. The Delphíniums are all of them varieties of D. grandiflorum.

J. L.—Your plants are, 1. Ajuga reptans; 2, an Erýsimum; and 3. Phlox divaricata.

J. W. T.—The plant is Gardénia radicans.

C. D. B.—The Yellow Banksian Rose, which was planted three years ago, and which has not flowered for the last two seasons, will probably be thrown into bloom next spring, by digging a trench round the stem in the autumn, about two or three feet distant from it—cutting off all the roots which you may meet with, and afterwards filling up the trench with poor gravelly soil. The reason of your plant flowering the first year, was undoubtedly owing to the check which it received in being transplanted. In pruning it, leave as many branches as can be conveniently laid in; shorten these and cut all others off close to the stem.

Devoniensis.—For such purposes as yours we advise you to heat your greenhouse with one of the closed hot water apparatuses. The pipes need not run round the ends of the house, unless you want more heat during winter than is usual in greenhouses. The place of a Vine may be occupied by Hardenbérgias, Kennédyas, Passiflora Loudoni, Mandevilla suaveolens, Dólichos lignosus, or even a scarlet Pelargónium.

P. P.—Saltpetre acts much like nitrate of soda; but its high price forbids its being extensively employed.

W. D. F.—The most useful book for travellers wishing to study European plants is *Koch's Flora Germanica*, the next is *Reichenbach's Flora Excursoria;* both are in Latin. All that is necessary in making collections of dried plants while on a tour, is a few quires of German or French grey paper, which is far better for the purpose than our English paper; and card-board and straps, between which to compress the specimens. They must be shifted into fresh papers as they become damp.

A Novice.—Soapsuds contain a large quantity of alkali, and are a useful manure; but you must not apply them often. Try the effect of them by degrees, and let us know the result.

E. W. M.—Apply to J. C. Loudon, Esq., Porchester-terrace, Bayswater.

A Subscriber.—There is nothing settled as to what constitute the properties of a first-rate Rose. If you would but have patience with your Asparagus, you will find it branch. It must have *time* given it to grow. Do you find that putting a hand-glass over a Cauliflower plant, causes it to form its head in ten days? Just consider how long it takes to form a head of Broccoli.

R. H. B.—It is impossible to give a decided opinion upon your seedling Pelargonium, the petals having fallen. We can only say that it promises well; the petals are of a good form, and their edges free from roughness. The spot washes away a little too much. You must send a truss of flowers as soon as the plant gets into good condition; there is an appearance of its proving a desirable variety.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The arrival of the India mail has supplied us with detailed particulars of the intelligence brought by the extraordinary express of last week. The leading facts are the gallant achievement of Gen. Pollock's army in forcing the Khyber Pass; the victory of Sir R. Sale over the forces of Akhbar Khan, by whom his position was invested; and the surrender of Ghuznee by Col. Palmer. The union of the armies of the two Generals removes all apprehension for the safety of Jellalabad, and will no doubt have great influence in reducing the Affghans to obedience. The surrender of Ghuznee is attributed by Col. Palmer to the reduced state of his garrison, the want of water, and the overwhelming force of the enemy. The measure is further justified by instructions received from Sir W. M'Naghten, Major Pottinger, and Gen. Elphinstone; but the whole proceeding is generally considered unsatisfactory, as, indeed, is made apparent by the fact that Lord Ellenborough has instructed the Commander-in-Chief to bring both Col. Palmer and Gen. Elphinstone to trial by Court-Martial, and to institute an inquiry into the conduct of the political agents. A temporary reverse has been sustained by Gen. England at the pass of Kojuck, while on his march to relieve Gen. Nott in Candahar; the pass was occupied by a strong body of Affghans, who offered sufficient resistance to induce the General to fall back on Quetta, where he intrenched himself to await the arrival of fresh reinforcements. There appears to be no doubt of the assassination of Schah Soojah by the Ghazees, and consequently another advance on Cabul is considered certain. The interior of India continues tranquil; the King of Burmah, whose movement towards Rangoon recently excited apprehension, is fully occupied in suppressing a rebellion at home. The quarrel between the Chinese and the frontier garrisons in Cashmere, is considered likely to lead to British interference, and to the ultimate cession of Cashmere and the Punjaub to the Indian Government.—From China we learn that Sir H. Pottinger has announced that Hong Kong and Amoy will be retained in our possession until all demands of the British Government be satisfied; no renewal of hostilities had taken place at Canton; and the forces under the command of Sir H. Gough and Sir W. Parker continued at Ningpo. The war about to break out between Cochin China and Siam was expected to embarrass the councils of Pekin, and to facilitate in some degree the purposes of our expedition.—In France, the present session of the Chambers is drawing to a close; the Deputies concluded their sittings on Saturday, and the Peers will probably close their session on Monday next. The decree of dissolution is expected to appear on Tuesday, and the general election will take place early in July.—The Ministerial crisis in Spain still continues: the resignation of the Gonzales Cabinet has been accepted, and M. Olozaga, the leader of the opposition, and the Presidents of both Chambers, have been in vain applied to by the Regent to form a new Cabinet. The dissolution of the Cortes is considered by some parties to be inevitable, while others anticipate the re-organisation of the late Ministry, with certain modifications. Madrid continues tranquil, but some disturbances have occurred on the frontier, and apprehensions are entertained of another outbreak in connexion with a Christino-Carlist conspiracy.—From Portugal we learn that the Government has expressed itself unanimously in favour of the commercial and slave trade treaties, and that no doubt is now entertained of their immediate ratification. Advices from the Levant inform us that Syria is still in a disturbed state; Omer Pacha has not yet been recalled from the Government of the

Lebanon, and the remonstrances of the Great Powers on the subject have hitherto been evaded. The Greek question has made little progress, and the Porte has expressed its determination not to treat with King Otho until ample compensation has been given for several grievances complained of by the Turkish Government.

At home, the proceedings of Parliament are the leading subject of interest. Lord J. Russell has brought in a Bill for the better discovery of bribery at elections; and Lord Ashley has obtained leave to introduce a bill for the better regulation of labour in mines and collieries. Both Bills will be supported by Government, and will no doubt be received with approbation by the country at large. The Tariff has made some progress; the several amendments proposed have all been negatived, and the measure has thus far proceeded without modification.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal continue well. The Queen and Court left Buckingham Palace on Monday for Windsor Castle. On Saturday her Majesty reviewed some troops of cavalry on Wormwood Scrubbs. On Tuesday and Thursday the Queen and Prince Albert, accompanied by Count Mensdorff and his four sons, with a numerous suite, proceeded in the usual state to Ascot Heath, to be present at the races. Her Majesty has created Count Mensdorff an Honorary Knight Grand Cross of the Order of the Bath.—The Countess of Dunmore has succeeded Lady Portman as the Lady in Waiting on the Queen, and Lord Rivers and Mr. O. Gore have succeeded the Earl of Morton and Captain Meynell as the Lord and Groom in Waiting on her Majesty.—It is reported in the fashionable circles that the Duke and Duchess of Sutherland have received an intimation of the intention of her Majesty and Prince Albert to honour them with a visit at their seat, Trentham-hall, Staffordshire, at the close of the season in town.

Parliamentary Movements.—Lord Desart and Mr. T. Gladstone have been returned for the borough of Ipswich. The numbers for the respective candidates at the close of the poll were as follows: Lord Desart 680, Mr. T. Gladstone 673, Mr. T. Gisborne 543, Mr. G. Moffatt 541, Mr. J. Nicholson 3.—Two candidates have offered themselves for the representation of the borough of Newcastle, Mr. J. Colquhoun and Mr. Harris.—The Waterford Election Committee have decided that Mr. W. Christmas and Mr. W. M. Reade were not duly elected for that city; and that Mr. H. W. Barron, now Sir H. W. Barron, and Mr. T. Wyse, were duly elected, and ought to have been returned.

The Gold Coinage.—The Gazette of Tuesday contains a proclamation by the Queen, relative to the present state of the gold coinage in this country. It states that due attention does not appear to have been paid to its weight and the directions already in force by Act of Parliament with respect to the cutting or defacing such coin; and it concludes by stating, that in future, every sovereign, of less weight than five pennyweights two grains and a half, and every half sovereign, of less weight than two pennyweights thirteen grains and one eighth, shall not be allowed to be current in the kingdom. The following notice relative to this subject was issued from the Bank of England on Thursday. It will be seen by it that much of the inconvenience which was expected to result from the difficulty of getting rid of coin deficient in the required weight at its real bullion value, is obviated under the directions given by the Lords Commissioners of the Treasury. "At the request of the Right Hon. the Lords Commissioners of her Majesty's Treasury, and for the relief of those who have in their possession the gold coin of this kingdom, below the legal current weight: Notice is hereby given that, from and after this day, the 9th inst., any quantity of gold coin, in amounts of not less than 50*l.*, will be taken in at the Bullion Office of the Bank of England, at 3*l.* 17s. 10½d. per ounce, from the hours of 9 o'clock in the morning to three in the afternoon until further notice."

Foreign.

FRANCE.—*The Chambers.*—The present session of the Chambers is drawing to a close; the Deputies concluded their sitting on Saturday, and the Peers will probably terminate their labours on Monday next. It is expected that the decree of dissolution will appear on the 14th inst., and that the general elections will take place on the 9th July. The proceedings, since our last, in the Chamber of Peers, have not been of great importance. The general discussion on the Railroad Bill has passed off without presenting any feature of interest, and though several amendments were proposed the Chamber adopted the Bill in the form sent up from the Deputies by a majority of 107 to 55. The Sugar Bill was then voted by 122 to 6. The Chamber of Deputies has voted a bill relative to the foreign refugees, who are to remain a year longer under the special *surveillance* of the police, and another granting 30,000f. to be employed in making experiments for the establishment of a night telegraph. A petition was presented to the Chamber for a reform of the postage. The commission which examined it proposed its rejection. It declared that twenty millions of francs postage revenue could not be spared, and that pre-payment was an object difficult to attain. The great amount of postage on English letters was not noticed by the commission. During a discussion on Saturday, on the linen thread question, M. Cunin Gridaine, Minister of Commerce, declared that whatever might be the conclusions of the committee, whose report had not yet been made, he had not retracted the engagements he had lately entered into; that is, to increase the duties on English threads 20 per cent. "This dignified reply," remarks the *Debats*, "to the menace of the English Ministry to resort to reprisals, by opposing tariff by tariff, made a strong impression on the Chamber." The last measure of the Chamber was the voting the Budget of Receipts, which was carried by a majority of 255 against 59.

The Capital.—A report has been current in the capital for several days that the King has been seriously ill; but there is no foundation for the rumour. The "Moniteur," official organ, announces that the Prince de Joinville and the Duke d'Aumale, who were to go to England towards the end of this month, have abandoned the intention, at least for the present. The Duke de Montebello, the French Ambassador at Naples, had arrived in Paris. Count Pontois was expected to leave immediately, to resume his post as Ambassador at Constantinople.

The Fortifications.—On the 2nd inst., the King laid the first stone of the fort of the Bicètre, which is to command the plain of Villejuif, the valley of the Bievre, and the road to Italy. The papers, in commenting on this fact, observe that "this fort is situate within a short distance of the continuous wall, and can easily batter the suburbs of St. Jacques and St. Marceau; that it is one of the most menacing for the capital, and will have five bastions, three of which are to be turned against Paris."

The Fleet.—Accounts from Toulon of the 2nd inst., announce that three frigates, the Belle Poule, Didon, and Atalante put to sea on that day. Vice-Admiral Hugon's squadron had left the anchorage off the islands of Hyères for some days, and had sailed towards the Balearic Islands. It was imagined that it would anchor at Port Mahon and then cruize off the Corsican coast.

Havre.—It is stated that the operations on the wreck of the Telemaque, lost in 1789, which were commenced last year, but which have been suspended since the setting in of the stormy weather in Nov., are at once to be recommenced, and to be carried on with great vigour. The proceedings of last year engaged general attention, as much on account of their novel character, and the activity with which they were conducted through an unfavourable season, as in consequence of the treasures anticipated from the raising of the vessel. It is stated that the parties interested in the salvage have collected evidence of the existence on board of specie and bullion to the amount of 33,000,000f., besides some valuable paintings by old masters. A sum of 2,500,000f. in gold, despatched to England by Louis XVI., is stated to have formed a portion of the cargo. It is noticed as a singular coincidence that the "Annual Register" for 1789 mentions the fact that the plate of that monarch had been sent to the Mint to be coined for the use of the Royal family, a little before Le Télémaque was despatched from Rouen for England.

Algeria.—Advices have been received from Algiers to the 30th ult. They contain an account of an engagement which took place on the 21st with a corps of 4,000 Arabs, who had attacked the camp of El Elarouche on the Constantina road, defended by Commandant Montauban with 500 infantry and 114 cavalry. In this affair, the Arabs are stated to have lost 300 killed, and the French only one officer and a sergeant slightly wounded.

SPAIN.—Our intelligence from Madrid is to the 4th inst., at which date the Ministerial crisis still continued. On the 30th ult., the Gonzales Cabinet gave in its resignation, and it is stated as a fact generally credited in Madrid, that the Regent, when accepting it, declared his unwillingness to dissolve the Cortes. On the same day, M. Olozaga was sent for by the Regent, who, it is said, offered him the Presidency of the Council, if he would undertake the construction of the new Cabinet. After a long conference, however, M. Olozaga declined the offer. The proceedings in the Senate on the 30th ult. were of no importance, and the Chamber of Deputies have adjourned until after the formation of a Ministry. A telegraphic despatch from Bayonne, dated the 7th inst., informs us that Gen. Rodil, on the receipt of an estafette from the Government, started immediately from Tolosa for Madrid; that the Regent had called upon the Presidents of the two Chambers to form a Cabinet, but that they had refused, and it was anticipated that Gen. Rodil would be charged with the task of forming the new Ministry. Private letters from Bayonne state that a small insurgent force had appeared in Biscay, under the command of a late sergeant of Miguelites, who, though compromised in the events of Oct. last, contrived to escape, and had been since concealed in the mountains. The Government were making preparations to repel any attack that might be made from the French territory, and Gen. Rodil had been for some time occupied in constructing fortifications on those points which might afford access to an invading force. Subsequent accounts from Madrid inform us that the Regent had sent Zurbano to Catalonia, a measure that was regarded as indicating his determination to act with severity in the event of disturbances in that quarter. The Curé Pinos Tome, and other persons ill-disposed to the present Government, had been sent to Seu d'Urgel. Filip, with his band, was in Lampourdan. News by extraordinary express from Barcelona of the 4th inst. states that everything was quiet in that city, and that the French ship of war which had been ordered to reinforce that station had returned to Toulon. The Ministerial crisis continued, and was considered likely to last some days longer, all the Parliamentary persons who had been applied to still declining to enter the new Administration. Messrs. Olozaga and Cortina had not again been sent for by the Regent; but it was the general opinion that the formation of no Cabinet was practicable without the accession of either of those two statesmen. Gen. Seoane was the only person of influence labouring to re-organise the Administration. The difficulties which all the combinations experienced gave rise to a variety of rumours: it was even said that the Gonzales Cabinet would be recalled, under certain modifications, and that the Cortes would be dissolved; but this was considered improbable. The "Times" of Thursday published the following note, said to have been written by the ex-Queen Christina, residing at present in Paris, to her brother-in-law, Don Carlos, now a state prisoner in Bourges: "To his Royal Highness D. C., Infant of Spain, &c. In consequence of the answer you have given, through Gen. N—, to my first verbal message, I think I should not hesitate any longer in testifying to you all that confidence with which your personal character inspires me. Fate has persecuted me as well as your Royal Highness; and what is more, I am for the moment separated from my august children. In the name of the holy religion which inspires us, as well as for the good of the Spaniards, who, carried along by a man whom I have loaded with benefits, may for a moment have forgotten their sacred duty, we will combine in an enterprise which, although it did not succeed as I would have wished last September, will not fail in its salutary effect from the moment when we act in concert. I would willingly subscribe to such reasonable conditions as you may deem it expedient for me to submit to. Your affectionate, M. C. March 14th." The "Times" adds, "This document will, no doubt, call forth the attention of our Government, who are entitled to ask for some explanation from that of France, provided they believe it to be genuine. We are not without expectation of some further information on this matter."

PORTUGAL.—We have advices from Lisbon to the 30th May. The commercial and slave trade treaties were both at length in such a state of forwardness, that little doubt appears to be entertained of their being signed within a week or ten days. A Council of Ministers had been held, at which all the questions relating to these negotiations are said to have been fully discussed. Some objections were made by the Ministers of Justice and Marine; but after explanations by Baron Tojal, Government pronounced its opinion unanimously in favour of the treaties. A decree had been published, allowing ships touching at Madeira for refreshments, to take on board provisions, wine excepted, without paying export duty.—The elections were to take place on the 5th inst.; but it was thought probable that the Cortes would be further postponed, in consequence of the inconvenience to the farmers and country proprietors of spending the months of July and August in the capital. The British man-of-war Indus was about to leave Lisbon for the Mediterranean, and to be temporarily relieved by the Malabar, Capt. Sartorius. Lady Isabella Pitcairn died at Lisbon on the 29th ult. She had arrived from England for the benefit of her health by the Braganza steamer on the previous day.

GERMANY.—The papers are occupied in discussing the plan of a comprehensive colonisation scheme, said to be entertained by the States of the Confederation. It is reported that the great Powers of Europe, but more particularly those of Germany, have become convinced of the necessity of appropriating colonies to each nation, and that for carrying the plan into effect a Congress is about to meet at Aix-la-Chapelle. It is proposed that each state shall have a colony at least equal in extent to the mother country, and that funds shall be raised for the formation of a fleet to protect the colonies against foreign aggressions, and to preserve tranquillity by preventing them from making attacks on each other. Attention appears to be principally directed to Brazil, and it is asserted that the Government of Rio de Janeiro is disposed to make grants of various districts to German emigrants for colonisation, on certain conditions.—A letter from Rastadt, dated the 25th ult., states that the village of Berga, in that district, has been nearly destroyed by fire. Of 110 houses, 75 were burned to the ground.—Accounts from Berlin of the 28th ult. state that the Ministerial paper, published on that day, contains a circular letter from M. Von Rochow, Minister of the Interior, to the chief presidents of the provinces, enjoining them to send in general accounts of the periodical press and daily literature in the provinces. The Minister observes on the great importance of the periodical press, which has become indispensable to the people of all classes, and remarks that the contents and the tone of the journals of a province afford a safe clue to the intellectual proficiency of the inhabitants, and that a view of the collective periodical literature of all the provinces would furnish a striking picture of the intellectual physiognomy of the nation. For the purpose of attaining this object, the presidents are directed to furnish the Minister with a general review of the periodical literature of their respective provinces; and the following fundamental bases are directed to be adhered to in drawing up the reports. All the journals are to be considered as objects of this report which require a license from the Ministry. They may be divided into such as are political, scientific, industrial, or legal. The report is to state the character and tendency of the journals, their value and usefulness, how many printed, their circulation in the provinces, and the class of readers. Accounts of the foreign journals are to be added, giving an estimate of the number of copies circulated in the provinces, and among what class of readers. This detailed statement is required in the first report only; after which an annual report, to be made in Feb., will state the changes that have taken place in the course of the year. The King of Prussia has allowed three young officers of the Guard to join as volunteers in the next campaign of the Russians against the Circassians. Capt. Von Orlich, who has obtained permission to join the English Army in Affghanistan, was to have set out from London on the 1st inst.—The King of Prussia has founded a special class of the order Pour le Merite, to be conferred on persons who have distinguished themselves in the sciences or arts; the number of the members of the German nation being fixed at thirty. The order will also be conferred on eminent foreigners, the number of whom is not fixed, but is never to exceed that of the German members. On the death of a German member the vacancy must be filled up; but on the death of a foreign member this is not necessary. Among the foreign members in the class of science, including, it seems, the *belles lettres*, are Mr. Faraday, Sir J. Herschell, and Mr. Thomas Moore. Baron Alexander Von Humboldt is appointed Chancellor, and Mr. Cornelius, the eminent painter, Vice Chancellor of this branch, which is to be called "The Peace Class of the order Pour le Mérite." A discovery has lately been made at Nuremberg of a band of murderers of a formidable character, who have long carried on their proceedings undetected; and it is feared that numbers never heard of have perished by their hands. The circumstance which led to their detection was the discovery made in Dec. last, of the limbs of a body, supposed to be that of a rich widow, who had suddenly disappeared from her habitation, and which were found in the streets of the city. The police made great efforts to discover the circumstances which led to the death of the deceased, but for a long time without success. Two other persons were shortly after assassinated in the same mysterious manner, and great alarm and excitement prevailed in the town. At length, however, the suspicions of the police having fallen on a woman, who had been in the habit of working for one of the murdered persons, they watched her; and having obtained some important evidence, they arrested another woman, who ultimately confessed her connection with a band of murderers, who had committed all the murders alluded to, as well as many others. She stated that having murdered the parties, the bodies were immediately cut in pieces, which it was her duty to dispose of in different parts of the town. The discovery of these circumstances has produced great excitement in Nuremberg and its neighbourhood; and the prisoners, who have been committed to gaol, were with difficulty saved by the police from the hands of the mob. It is not yet known how many persons have been destroyed by these murderers, but it is feared that they are numerous: and as Nuremburg is situated on the great European route, and is consequently the constant rendezvous of foreigners, it is supposed that the murderers imagined that their practices would be less likely to be detected, from the fact that foreigners would not be readily missed.

Switzerland.—The papers state that subscriptions in favour of the sufferers from the fire at Hamburgh have been opened in nearly all the Swiss cantons. The Grand Council of Argau, in the session which has just closed, has rejected a proposition for the sale of the property of the convents, by a majority of 100 to 50. The Constituent Assembly of Geneva has adopted the new project of Constitution, and in a few days it will be submitted to the people of the canton for their approbation. The journals contain the following observations relative to the communication said to have been made to the Vorort by the English Minister in Switzerland, noticed in a former number:—"The confidential note of England only touched on the affair of the convents to recommend the cantons not to let the matter degenerate into a question of religious fanaticism. In this respect the good sense of the Swiss people is a sufficient guarantee of the favourable reception that will be given to the recommendations of England. The English Cabinet, although Tory, lets Switzerland understand that it will support her with all its power to preserve her independence untouched. Without entering into explanations on the internal political government of the cantons and the confederation, the English Cabinet appears to allow that this Government is altogether conformable to the wants of her situation, and that it has perfect confidence that Switzerland will maintain that neutrality which treaties have assured to her." The "Augsburg Gazette" on this subject says—"Hitherto France had observed a perfect neutrality respecting the convent affair, but lately a despatch arrived from the Tuileries, in which the Cabinet declares in favour of Austria and the convents, but without departing from its tone of conciliation." The papers state that the Grand Council has just ratified a treaty made by the Executive Council with the government of France and Sardinia for the mutual extradition of criminals. Political offenders are not included. And it is further stipulated that, in cases where a criminal had previously committed any political offence, he shall not on the latter account be subjected to any prosecution after being delivered up.

Italy.—Accounts from Rome inform us that a Consistory was held in that city on the 23d ult., at which a Cardinal's hat was conferred upon M. de Bonald, Archbishop of Lyons, with the usual formalities; and that on the same occasion the appointments of the Bishops of Poitiers, Angers, and Rodez, were confirmed. The King of Naples arrived at Palermo on the 16th ult. His visit, which was unexpected, is said to have been for the purpose of ascertaining whether the laws are strictly and impartially enforced in this part of his dominions. Private letters from Genoa, dated the 25th ult., mention the departure of Mr. Brunel for London, but add that other English engineers remain at Genoa, to complete the surveys for the projected railway through Piedmont. We have noticed in a former number the difference at present existing between the Neapolitan Government and those of Belgium and Holland, respecting the question of the Tavoliere di Puglia. As our readers may not be aware of the real nature of this difference, the following brief account of the affair that has led to it may be interesting. It appears that in 1833, the Marquesses of Dragonetti, Tortona, and Desmeures, founded a society the object of which was to render assistance to the shepherds and cultivators of the great plains of Apulia, to introduce into them Merino sheep, Thibet goats, the best modes of manuring, agricultural tools, models of farms, &c. This institution received the Royal sanction in 1834, and the title of "Banco del Tavoliere." In 1835, arrangements for a loan were concluded with M. Van Haken, banker at Brussels; and an anonymous society was immediately formed, with a capital of two millions of ducats, divided into 20 shares of 100,000 ducats—these again subdivided into bills of acceptance of 100 ducats. This society held sittings in three places; one at Naples, the other at Foggia, on the spot, and the third at Paris. The attractive list of directors, in which appeared the names of princes, dukes, generals, and high functionaries, attracted a great number of stockholders, both foreign and native. It will be unnecessary to enter into further details, beyond stating that the company soon fell into discredit, and broke up. The creditors, the greater number of whom were Belgian or Dutch, have applied first to the directors, and then to the Neapolitan Government, in order to obtain at least an explanation of this affair, of which it seems nothing has been heard for some time. Their requests have hitherto been taken no notice of; and as several millions are at stake, they have applied to their respective Governments, entreating them to use their political influence, in order that justice may be rendered them. The Neapolitan Government replied that the affair regarded the tribunals, and that the creditors should have had recourse to them. It is stated that the king has not only refused the intervention of Rome and Austria, but also that of France. On the other hand it is affirmed that Holland has no intention of coming to open hostilities with Naples on the question.

Malta.—Accounts received from this island state that the squadron under the command of Vice-Admiral Sir E. Owen, put to sea on the 20th ult., and on the 24th, after exercising the guns, was seen standing to the northward. On the 11th ult., Prince Frederick William of Prussia, accompanied by two of his sons, arrived at Valletta, from Naples, under the assumed name of the Count of Glatz. Being desirous of seeing the effect of the shells, or hollow shot, fired from the large guns of our steamers, which he had heard proved so effectual at Acre, Admiral Sir E. Owen conducted his Royal Highness to a remote part of the coast, in H.M. steamer Devastation, where some shells were directed against the rocks, doing such powerful and precise execution as quite satisfied the Royal visitor. His Royal Highness returned to Naples after a few days' stay in the island.

Turkey.—By the arrival of the Levant mail we have received advices from Constantinople to the 17th ult. Intelligence had been received from Beyrout, announcing the breaking out of an extensive rebellion at Latakia. According to the last accounts from Syria, brought to Constantinople by the mail from Beyrout, Omer Pacha still remained at Deir-el-Kammer, where he had received a considerable reinforcement of Albanians, amounting altogether to 8,500 men; and other troops are said to be ready to follow the same destination. The accounts from Beyrout give a serious description of the misery prevailing amongst the Christian population of Lebanon since the last disturbances, and of the cruelty practised by the Albanians towards the Maronites. It is stated that the Porte evades all the representations made on this subject by the British Ambassador, in conjunction with the representatives of Austria and Prussia; and that although the Grand Vizier, Izzet Mehemet Pacha, replies to each note of Sir S. Canning that he will take into consideration the demand of the three Powers relative to the recall of Omer Pacha, that officer still remains unrecalled in the fortress of Mount Lebanon, and suffers the Albanians to plunder the Christian villages which had escaped the attack of the Druses. The Druse prisoners lately captured, as noticed in a former number, by Omer Pacha, had arrived at Constantinople. Sayd Pacha, the son of Mehemet Ali, has been nominated to the Pachalic of Sidon. The fall of Izzet Mehemet Pacha is now regarded as certain. Two of his principal supporters have been expelled by Riza, so that his own downfall is considered imminent. Halil Pacha will, it is said, in that case be Seraskier. The negotiations relative to the Greek question were still pending, the Porte not appearing disposed to treat with King Otho, until his majesty should have given ample satisfaction for the attempts committed by Greek citizens at Chalcis, and compensation for the sequestered Mussulman property. Accounts had been received from Trebizond, stating that Sir J. M'Neill was expected there from Persia; and it was believed that an English steamer would remain at Constantinople in order to convey his Excellency to England.

Egypt.—Our intelligence from Alexandria is to the 16th ult. There is no political news. The English consul, Mr. Stoddart, had addressed a circular to the British merchants on the 13th ult., informing them that he had received a letter from Boghos Bey, acquainting him, by order of the Pacha, that the trade in cotton would be rendered free from the period of gathering the ensuing crop. Private letters inform us that Capt. Basil Hall and family, after having performed their tour to Thebes, in Upper Egypt, proceeded to Syria, and completed no less successfully a visit to the Holy Land, having made an excursion to the river Jordan and the Red Sea. They have since gone on to Greece and Constantinople.

India.—We have received the details of the Indian news, a brief extract of which was given in our last, as communicated by telegraphic despatch from Marseilles. Notwithstanding the unfavourable character of the news from Ghuznee, it will be a satisfaction to our readers to learn, that the general character of our affairs in Affghanistan has assumed a more encouraging aspect. Our intelligence from Bombay comes down to the 4th ult., and from Calcutta to the 24th April. The following is a summary of the events which have transpired since the last mail. The division under Gen. Pollock, originally a Bengal artillery officer, have gained the renown of opening a pass hitherto considered too strong to be forced, and which even Nadir Shah was obliged to purchase. Having taken due precautions, this division, consisting of H. M. 9th reg. of infantry, and the 26th, 30th, 33rd, 53rd, and 64th Bengal Native Infantry, and a regiment of Jezailchees, with artillery, in three columns, forced the difficult pass of the Khyber on the 5th April, and, notwithstanding the determined resistance of the Afreedees tribe, succeeded in reaching Ali Musjeed, with the loss of only 1 officer (Lieut. Cumming, of the 9th), and 13 rank and file killed, and 104 wounded. On the 9th April the division was at Lundee Khan, whence to the point of junction with the garrison of Jellalabad, no serious opposition was expected. The details of this brilliant exploit, which are given at length in the official despatches, exhibit the gallantry of our troops in a very favourable light; and show that great assistance was derived from the co-operation of our Sikh allies, who fought with bravery and determination. During the period of the attack on the Khyber, Akhbar Khan, who with 6,000 Affghans had invested Jellalabad, exhibited much eagerness, as if to aid the tribes around the pass in defending it. On the evening of the 6th April he caused a *feu de joie* to be fired, in honour, as he said, of the repulse which the British troops had met at the entrance of the pass near Jumrood. But Gen. Sale, not deceived by this statement, communicated to him by spies, resolved to anticipate what he considered to be an intended retreat of the Sirdar, and on the morning of the 7th April sallied forth to attack the Affghan camp, and succeeded in completely routing Akhbar Khan and his 6,000 men, burned their camp, and retook 4 guns of those seized at the massacre of Khoord Cabul in Jan. last, "the restoration of which was regarded by the troops with much honest exultation." The loss sustained by the garrison was very trifling; but the death of Col. Dennie, who fell at the head of his regiment during the sortie, has occasioned general regret. A reverse, which is not considered of great importance, has been sustained by Gen. England at the pass of Kojuck, 63 miles from Quetta, on the march to Candahar. His force was composed of 5 companies of H. M. 41st reg., 6 companies of the light battalion of Native Infantry, 1 troop of light cavalry, 4 guns of Leslie's horse brigade, and 50 Poonah horse, having in charge a convoy, consisting of treasure, medical stores, and ammunition, together with 1,500 camels, &c., destined for the relief of the troops at Candahar. The convoy proceeded, without encountering any great obstacles, and without receiving notice from the inhabitants of a contemplated plan of resistance, to the pass, where on the 28th March it found that some field-works had been erected. An attempt was made, by sending 200 men to attack these works, to dislodge the enemy, when they showed a strong force of infantry and cavalry. Capt. May, of the 41st, was shot dead, as well as several of his men; and Major Abthorp, of the 20th Native Infantry was seriously wounded, from the effects of which he died the following day. The General then resolved not to risk the loss of the convoy, and made a skilful retreat to a neighbouring village which he defended, and thence withdrew to Quetta, where he intrenched himself and waited for more troops, then on the march from Dadur and Sukkur, to join him. The loss on this occasion, besides the officers mentioned, was 2 sergeants, 1 corporal, and 14 privates of the 41st killed, and 1 sergeant, 1 corporal, and 50 privates wounded of the light battalion. Of the 20th, 25th, and 6th Regs. Bombay Native Infantry there were killed 9 and 18 wounded. The great difficulty of the position at Quetta appears to have been the want of forage for the camels, and the efforts of the Government are now directed towards enabling the troops to proceed onwards as speedily as possible. As a contrast to this reverse, a force from Candahar sent by Gen. Nott to meet Gen. England, having been attacked, after two days' march by a large body of the enemy gallantly repulsed the assailants, and compelled them to take to flight. The Affghans are described as fighting with reckless bravery, and charging up to the bayonet's point; in consequence of which they suffered great slaughter, particularly as they were charged by the British cavalry during their flight. About 300 are said to have fallen, including five chiefs. The loss on the side of the British was five killed and 25 wounded. The Commander of the British force was Col. Wymer. Candahar is stated to have abundant provisions, but there is a want of ammunition. It is said that the pass of Kojuck can now be easily turned. The most serious reverse, however, and that which is most likely to produce the greatest impression, is the surrender of Ghuznee. Col. Palmer surrendered this important fortress in the early part of March. In a despatch dated the 1st of that month he assigns as his reasons for having agreed to capitulate within six days, that he was attacked by an overwhelming force, that the men under his command were exhausted by fatigue, suffering from want of water and likely to have the supply entirely cut off. He also states that in surrendering the fortress he only acted in compliance with instructions received in the first instance from Sir W. Macnaghten, and subsequently from Major Pottinger and Gen. Elphinstone. The conduct of Col. Palmer, however, appears to be generally deemed unsatisfactory, and the new Governor General has instructed the Commander-in-Chief to bring both Gen. Elphinstone and Col. Palmer to trial by a court martial, at the earliest opportunity. Lord

Ellenborough has also directed an investigation to be made into the conduct of the various political agents who have been employed in Affghanistan. The terms of the capitulation of Ghuznee stipulated that the British troops should receive honourable treatment, and be allowed a safe passage to Cabul. This was sworn to by the Affghan chiefs. It is, however, stated that there is great reason to believe that, if not the whole, at least the greater portion, of the garrison have been massacred in the same manner as the retreating army from Cabul. In the meantime Lord Ellenborough, accompanied by two or three secretaries, had set out from Calcutta to the upper provinces of Bengal. His object in this journey is stated to be twofold—first, to be enabled to communicate without delay with the Generals of the army west of the Indus, and the officers commissioned with the management of those provinces; and next, to introduce some reforms there. In the interior of India general tranquillity prevails, if we except some slight disturbances in Bundelcund. The Governor of the Madras Presidency had published stringent orders respecting the late insubordinate proceedings of some native troops at Secunderabad. Subscriptions to a considerable amount had been entered into all over the country in favour of the widows and orphans (unprovided for by the regulations of Government) of those who fell during the recent disasters at Cabul.—The cholera has committed serious ravages at Kurachee. Her Majesty's 22d Reg. had lost 98 men in six weeks up to the 24th April. Tharawaddie, King of Burmah, whose movement towards Rangoon produced some sensation a short time back, was occupied at home in suppressing a rebellion. The Chinese soldiers who drove the Sikhs out of Thibet appeared disposed to revenge themselves upon the invaders, by attacking some of the frontier garrisons of the province of Cashmere. This attempt is considered important, as it is thought it may lead the British Generals, on terminating the campaign in Cabul, to turn their arms against the Chinese in Thibet, and produce by the defence of the country, the cession of Cashmere and of the Punjaub, by the present Government, to the rulers of India. The "Bombay Gazette," in an extra sheet, dated 12 o'clock, May 4, and published just at the departure of the steamer, gives the following extract from the "Delhi Gazette" of April 23:—"After our matter was arranged, and almost in the press, the Loodiana and Simla daks arrived, bringing us from our correspondents full accounts of the 'doings' in camp from the 5th to the 12th instant. The Simla letter, dated the 20th April, mentions that news had been received of Gen. Pollock's arrival at Jellalabad, but the date is not given; and also that an express had arrived, which gives out that there is not the least doubt of the murder of Schah Soojah by the Ghazees, as he was returning from a mosque where he had been praying; after this the Bala Hissar was attacked, ransacked, and plundered, and the Zenana became the scene of every atrocity that these savages could commit. It is now supposed that there will be no delay in pushing on at once to Cabul; the Queen's 31st and the 6th Native Infantry and the whole of that Brigade had arrived at Peshawur, and marched for Jellalabad; and Col. Bolton, having received orders to push on, will lose no time in reducing that place. The murder of Schah Soojah appears to have wrought a complete change in the ideas of our great men, and instead of a withdrawal to Peshawur, nothing but a speedy advance is talked of. A wing of the 33d, and light company of the 6th Native Infantry, remains at Ali Musjid. They have a couple of guns, and it would be difficult for the Afreedis to do anything in that quarter."

CHINA.—We have received intelligence from Canton to the 14th March. Sir H. Pottinger remained at Hong-kong, whither he was about to remove the Post-office and all other British establishments from Macao. He has issued some proclamations; by one of them Hong-kong and Tinghae in Chusan are declared to be free ports, and to remain, as well as Amoy, in our possession until the British demands are satisfied. If any one of them is to be vacated, due notice is to be given, and a special stipulation is to be made for the safety of the native Chinese who may have sided with the English. The batteries along the Canton river were completed, and some of them unmasked; but no apprehension appeared to be entertained of immediate hostilities. The troops of the expedition were healthy. A Madras regiment and the Bengal Volunteers were about to return to India. The head-quarters of Sir H. Gough continued at Ningpo; he and the naval commander were said to be authorised to act, in cases requiring urgent decision, without waiting to consult the Plenipotentiary. Sir H. Gough was about to disperse a body of Chinese troops collected near Yu-Yuou. The French vice-consul, M. Challaye, and some Frenchmen, had been seized and insulted by some Chinese, in the island of Hong-Kong, and it is thought that serious results would have ensued but for the timely arrival of an English patrol. It was said that there were Russian officers at Pekin, giving instructions in military matters to the Chinese. A war about to break out between Cochin China and Siam is regarded with interest, as likely to have some influence in the settlement of the British demands upon China. The Siamese monarch, it appears, threatens to invade Cochin, a tributary to China, which may tend to embarrass the councils of the court of Pekin.

Parliament.

HOUSE OF LORDS.

Monday.—A number of petitions on different subjects were presented. The Marquis of LANSDOWNE asked the President of the Board of Trade, whether he would lay on the table of the house the document or representation of the Great Western Railway Company on the subject of locking up persons in railway carriages? He said he was one of those, whom he believed to be a numerous majority, both in the house and the country, whose taste inclined very much to not being locked up, and he saw no reason to change his opinion.

The Earl of RIPON had no objection to the production of the report. Nothing could have been more fair and creditable than the conduct of the Great Western Railway Company in this and other matters; they and the other companies generally had always attended readily to the suggestions made to them. In this particular instance, they had declared their readiness to conform to the precautions required by the public, but they had stated at length the reasons why their own regulations had been adopted.

Lord DENMAN laid on the table, after presenting several petitions in its favour, an Act to provide for a general form of affirmation for all persons objecting to oaths from religious scruples. He did not intend to abolish oaths; nor did he believe that the bill would have this effect. The bill did not contain any provision for the registration of the parties, because he thought he could make it clear that there would not be any danger from allowing persons who wished to give evidence to do so upon affirmation instead of an oath; but if their lordships should import any provision for registration into the bill, the parties would still be grateful for the relief, although such a provision would impose some inconvenience on them.

The bill was then read a first time, and the second reading fixed for the 16th inst.

Tuesday.—The Australian and New Zealand Bill was read a third time and passed. In answer to a question by Lord KINNAIRD, the Duke of WELLINGTON said the money raised under the Queen's Letter would be paid over to the Manufacturing Distress Committee, which had existed in London since 1825. The money already subscribed by the Queen and the members of Government had been handed to the committee, who had also furnished the funds which had been sent down to Burnley. The Earl of RADNOR moved for a return of all sums advanced by Government for the relief of distress since 1826, and made some remarks on the impolicy of Government advancing money without the control of Parliament. Lord MONTEAGLE explained the course which had been adopted on former occasions by Government. A short conversation followed and the motion was agreed to.

The Income-tax Bill went through committee and was reported. On the motion of the Lord Chancellor the bringing up of the report on the Copyright Bill was postponed till Tuesday next.

Thursday.—On the motion of the Lord CHANCELLOR, the Jurisdiction of Justices (Ireland) Bill was read a third time and passed, as was also the fines and Recoveries (England and Wales) Bill, on the motion of Lord WHARNCLIFFE.—On the motion of the Earl of SHAFTESBURY, the Civil Decrees (Ireland) Bill went through committee.—The Earl of YARBOROUGH presented a petition from Lincolnshire, against the property tax.—Earl STANHOPE presented six petitions from members of benefit societies in Essex, for a repeal of the New Poor Law; also, a petition from the sawyers of Manchester, praying for protection from the injurious competition of machinery.

Lord WESTERN presented a petition from the corporation of Maldon, and several petitions from other places in Essex, against the income tax; also, petitions from the gardeners and seed growers of that county, against several of the regulations of the tariff respecting seeds and fruit.—Several other petitions were presented, but no business of interest was transacted.

Friday.—The House sat only for about half an hour. The second reading of the Income Tax Bill was expected to have raised a discussion, but owing to the sudden illness of the Marquis of Lansdowne, the discussion was postponed till the consideration of the bill in committee.

A question was asked by the BISHOP OF EXETER respecting the Ecclesiastical Courts Bill. The LORD CHANCELLOR recommended him to renew his question on Monday; but the BISHOP OF EXETER said that it was his misfortune to be obliged to leave town on Monday; whereupon the LORD CHANCELLOR, amid much laughter, declared that he could not consider that to be a misfortune.

HOUSE OF COMMONS.

Monday.—Several private bills were advanced in their respective stages. A division took place on the third reading of the Lough Foyle Drainage Bill; for the third reading, 85; for the amendment, 32; majority, 53.

In reply to a question from Sir R. Inglis, Mr. GLADSTONE said, that the directors of the Great Western Railway had promised to make arrangements for leaving the carriages unlocked.

Mr. ADDERLEY then moved that a new writ be issued for Newcastle-under-Lyne.—Mr. HUME moved as an amendment that the writ be suspended for a fortnight, and that a select committee of inquiry into alleged acts of bribery be appointed. Mr. O'CONNELL seconded Mr. Hume's motion. He said that malpractices in Newcastle had been proved before two committees—extensive drunkenness, bribery, and perjury. After a few remarks from Mr. LIDDELL, Mr. C. BULLER contended that the evidence implied general and notorious bribery. To send down the writ would be to issue an order for so much mere head-money. The House of Commons ought to be cautious of issuing writs to places where extensive bribery had prevailed, especially when a general measure of prevention was about to be introduced.—Sir W. FOLLETT objected to the principle of drawing general inferences from particular passages of evidence. The only case in which the House had a constitutional right to suspend a writ, was where a legislative measure was about to be taken for disfranchising or reconstituting the borough. Mr. BERNAL was for suspending the writ. Mr. WYNN thought there was evidence enough against this borough to demand inquiry.—Sir R. PEEL said, that each case must be decided on its own merits. The suspension of a writ was a very serious measure, and justifiable only by very special circumstances. The present case was not strong enough to justify it. Head-money was probably in its origin a commutation for a dinner to the poorer voters. It was a very objectionable practice, but still it was not what men commonly called bribery.—Lord J. RUSSELL understanding from Mr. O'Connell's speech, that there existed in point of law some doubt whether the receipt of head-money was bribery, and that it would be necessary to introduce into his bill a clause for the removal of that doubt, was unwilling that a writ should be sent to a set of electors who, until the doubt should be so removed, would be sure to take advantage of it for corrupt purposes.—The House then divided, when there appeared for the issuing of the writ, 143; against it, 97; majority, 46.

Mr. HUME protested against, what he termed, the hypocrisy of the House in pretending a horror of bribery, and yet thus protecting it by their votes. The writ having been ordered.

Lord J. RUSSELL moved for leave to bring in a bill having for its object "the better discovery of bribery at elections." To prevent this offence, he said, might be difficult, but was not hopeless. His object was rather to deter from bribery, by rendering the means of its detection more efficacious, than to check it by increased penalties. This he proposed to effect by permitting parties to give in lists of voters whom they affirmed to have been bribed at any election; and these voters should be liable to disfranchisement unless they could defend their votes. A power of granting indemnity in certain cases should be given, and the election committee to whom this power would be entrusted, should also be enabled to follow up inquiries, where they believed corrupt compromises had taken place in order to conceal bribery; the committee to have legal aid in conducting the protracted investigation. On the presentation of a petition alleging extensive bribery, the noble Lord proposes that it should be tried in the same manner as an election petition, the expenses to fall on sitting members or petitioners, as the case may be; and if extensive bribery were proved against a borough, it should be disfranchised. To obviate the difficulty of carrying disfranchisement bills through Parliament, the inquiry into bribery alleged against any constituency, to be conducted by a committee composed of Members of both Houses, in the proportions of four or five from the Commons, and three or four from the Lords, to be presided over by a Peer to be named by the Crown. The bribery oath now administered at elections to be abolished, as it only too generally adds the guilt of perjury to that of bribery. Lastly, the payment of any sum of money to electors or their families, either before or after an election, to be deemed to be bribery. The noble Lord did not anticipate that legislation alone would cure the existing evils, but he hoped the law would be aided by the growing moral and religious feeling of the country.

Sir R. PEEL said, he would give his cordial support to the bill. There were three cases where a great defect of law now existed. The first was where an individual seeking, or defending, a seat, was driven by the fear of expense to a compromise. There he thought the Election Committee ought to have the power of reporting upon the state of the inquiry and the expediency of continuing it at the public expense. The second case was where no petition was presented for the seat; the unsuccessful candidate being able, perhaps, to prove bribery, but shrinking from the expense of inquiry, and, perhaps, from its probable re-action upon himself. Still you must not be too ready to relieve the individual from the expense of proceeding for his seat, by throwing all the cost upon the public. And the member fairly returned ought not to be subjected to the annoyance of defending his seat against frivolous attacks—an annoyance from which at present he was a good deal protected by his opponent's apprehension of the costs. These were matters deserving the fullest consideration of the noble Lord. The third defect of the existing law was the want of means to deal with places where extensive bribery had prevailed. For this purpose he was inclined to approve the noble Lord's proposal of a mixed commission, whereof the members should be nominated by the Crown. And he should have no objection to make the provisions of the bill retrospective, so as to reach the cases of all elections which might take place after this notice, though before the passing of the bill. On the whole, he was inclined to anticipate much improvement from a law which would endeavour to remedy existing evils, such a law as the present bill; for even the very discussions which had arisen out of all these cases of bribery and compromises had been productive of much good.

After a few remarks from Mr. HUME, Mr. ROEBUCK suggested that each member should declare at the table of the house the amount of his expenses. Lord SANDON answered, that the amount of expense would prove nothing. In large constituencies, especially if there happened to be much excitement, a great deal of money might be spent without anything like bribery. He should like to see a Commission of Inquiry sent down by the Crown to those places where bribery had extensively prevailed; and if in any instance there should not remain 300 electors unbribed, he would disfranchise that borough. Leave was then given to bring in the bill.

The House then resolved itself into Committee on the Tariff. Mr. ROEBUCK proposed that the duties on foreign and colonial timber be rendered equal. He contended that the discriminating duties on timber were a loss to this country of two millions per annum, that they were of no use to Canada, of but little value to the shipping interest, and that there was no consideration which could justify duties compelling us to take inferior timber at a high price. Sir H. DOUGLAS repudiated the specious principles of free trade, and contended that the tariff was based on protective principles, adapted to the actual circumstances of each case. He concluded with proposing an amendment, "that the duties, on and after the 10th day Oct. next, should be fixed at 30s. on foreign timber, and 38s. on foreign deals, both per load; and that no ulterior reduction, as contemplated, should take place in either." Mr. P. STEWART proposed rather to place the duty at 5s. per load on colonial timber, and 35s. on foreign. He knew not what interest was benefited by cheapening wood.—Mr. GLADSTONE defended the government proposition, on the ground of the benefit which would accrue to trade and commerce, whilst no injury would result to colonial interests.

After some remarks from Sir C. NAPIER and Mr HUME,

Mr. BARING said he was not prepared at once to abandon all differential duties. But though the difference now recommended was a less protection than he had himself proposed when in office, he would not object to it on that account. He did think, indeed, that when Ministers were making a sacrifice of revenue to the amount of 600,000*l.* a year, it was not wise in them to throw the whole of that relief on the one article of timber; but that feeling would not induce him to vote for any of the plans which were brought forward in opposition to that of Government. On a division, there appeared for Mr. ROEBUCK's amendment 16, against 243.

It being by this time past one o'clock, a wish was expressed that the committee should adjourn, but the House appearing anxious to proceed with the discussions of the tariff, Sir H. DOUGLAS brought on his amendment.

Sir R. PEEL opposed it, and expressed his conviction that the system of taxation as proposed in the tariff was the best that could be adopted.

Mr. LABOUCHERE also opposed the amendment, and after a few words from Lord SANDON and one or two other members, it was withdrawn. The other orders of the day were then disposed of.

Tuesday.—Several bills were forwarded in their respective stages, and a number of petitions presented.—A statement was made by Sir R. Inglis, founded on a communication to him by the Sergeant-at-Arms, in reference to the alleged exclusion of some hon. members from the House during a recent division. A conversation ensued, in the course of which it was generally admitted that the Sergeant had only done his duty in the conduct he pursued.

The important motion long announced by Lord ASHLEY for leave to bring in a bill to regulate the age and sex of persons employed in mines and collieries was next brought forward. Lord Ashley commenced by calling the attention of the House to a long statement of very painful facts, disclosed in the report of the commission of inquiry appointed to investigate the matter, and which detailed the great hardships sustained by women and children employed in these works. These details related to the ages and sexes of the persons employed, the nature of the occupations, the ventilation and drainage of the mines, the indecency, as well as cruelties practised, and alluded more especially to the injurious consequences of the labour in mines on the constitutions and character of females. His Lordship said that, revolting as these details were, the commissioners, instead of exaggerating, had not even told all the amount of the evils connected with this serious state of things, for which a remedy was demanded on every ground of humanity and religion. He should therefore at once propose that all females should be excluded from employment in mines. Whilst the reasons for this complete exclusion were strong and imperative, the objections to it were grounded on mere considerations of selfish convenience and parsimony—short-sighted considerations, inasmuch as a contrary policy would prove far more beneficial. He would also exclude from mines all boys under 13 years of age. Nothing short of actual prohibition would avail, for any regulation would be quite impossible; the miner, when the labourers were once consigned to him underground, was absolute; and as to subterranean inspection, it would be at the hazard of the inspector's very life. He would next provide that the engine by which the labourers were drawn up and let down the mines, should be confided to no one under 21 years of age. The accidents occurring from the employment of young lads as engineers had been fatal and frequent. Fourthly, he would abolish the present system of apprenticing the boys, who were kept till 21 in a state of slavery, exceeding in hardship anything ever known in the West Indies, while their masters lived in utter idleness upon their labour. His Lordship then went into lengthened details of several cases of great cruelty and hardship inflicted on the females and children thus employed; and concluded by saying that he felt satisfied he had said enough to show that they were authorised, as an assembly of men—not to say Christians, to put an end to this state of things. They had given twenty millions of money to purchase the abolition of negro slavery, and now by their determination that night they might cheaply procure joy, and gladness, and freedom, for many a broken spirit and many a bruised heart. They might free women from their slavery, and they might permit the young to invigorate their frames for future labour, while they gave them the opportunity of acquiring the knowledge and the practice of virtue, morality, and religion. It was for this end that he proposed to put an end to the barbarous acts he had exposed—to improve the good, and to reclaim the wicked. He then moved for leave to bring in the Bill of which he had given notice.

Mr. F. MAULE briefly seconded the motion: paying a tribute of applause to the praiseworthy labours of the noble Lord in the cause of philanthropy.—Mr. LAMBTON, while complimenting Lord Ashley, and admitting the necessity of legislation, denied that females were employed in the collieries of Durham and Northumberland, and charged the reports of the sub-commissioner who collected evidence in that quarter with exaggeration.—Lord F. Egerton, in the name of a large class of coal-owners whom he represented, gave his hearty thanks to Lord Ashley. He did not believe that in the mines of his own county there existed any system of cruelty to the female labourers; but he was anxious on every principle of humanity, morality, and religion, to abolish all female labour in mines.—After a few remarks from Mr. Hume, approving of the motion, Sir J. Graham congratulated Lord Ashley on the general assent of the House to his motion, and expressed his own concurrence in the principle of all the four remedial suggestions made by him. With respect to the whole measure proposed by his noble friend, he thought that they were much indebted to him for his exertions in introducing it. He did not think that there was any one to whom that duty could be entrusted so as to command more public confidence; and he, on the part of Government, could assure his noble friend that they would render him every assistance in carrying on the measure.—A conversational debate of some length ensued, in which several members joined; after which leave was given to introduce the bill.

Mr. Gladstone, in reply to an enquiry by Mr. M. Attwood, answered that it was not the present intention of Government to make the Isle of Man liable to the operation of the tariff.—The House then went into committee on the Customs' Duties Bill.—Mr. G. Palmer opposed the proposed duty on the importation of shoes, and would substitute 1*l.* in lieu of 12*s.* on every dozen pair.—Mr. Ward said, he had been pressed by some of his friends to vote for the larger protection; but he had explained to them that the real interest of the working classes was to get all articles cheap.—Mr. Lawson and Mr. B. Wood supported the larger protection.

Mr. Gladstone vindicated the 12*s.* duty. He reminded the House that it was only the finer sort of shoes and boots which England imported; and as the proposed reduction extended to the raw material, the British manufacturers of the stronger and coarser shoes and boots, of which England was an exporter, would receive a considerable benefit.

After some further discussion the amendment was negatived by 148 to 36.

On schedule 12, Mr. M. Gibson asked the reason for laying an *ad valorem* duty of ten per cent. on cotton manufactures; on the part of the cotton manufacturers he disclaimed it.

Mr. Gladstone admitted that the cotton trade in general did not require protection, but said that there were certain branches of the manufacture which did; and for their sake this duty was now proposed. A long debate on the subject of free trade ensued, in which several members took part, some of whom advocated the principles of the Anti-corn-law League.

Mr. Ferrand inveighed against that association, and described them as having disappeared in disgrace. Some altercation followed between him and Dr. Bowring, whom he charged with having, on his foreign mission, declined to take any evidence, except such as suited his own theories.—Dr. Bowring strongly denied the charge; and several other members took part in the discussion, which at length assumed a warm and excited character.—Lord Stanley interposed to put a stop to it, and remonstrated against the delays by which the progress of the tariff was obstructed.—Mr. Brotherton moved the adjournment, which was seconded by Mr. Wallace. The latter gentleman alluded to the absence of Sir R. Peel from the House, but meeting with interruption which he considered to come chiefly from Col. Peel, he used some expressions, for which he was called to order by the Speaker, upon which he retracted them.—Mr. C. Buller made some comments on the somewhat noisy character of the Government side of the House, which he attributed to a natural laxity, arising from freedom from restraint, by the absence of Sir. R. Peel. At the same time he would try to bring back the House to the subject before it, which was an amendment of Mr. Mangles, that the duties on India cottons be reduced from five to three-and-a-half per cent. The gallery was cleared for a division, but the excitement continued, and the division was delayed some time. At length the question of adjournment was put, when there appeared 36 for it, and 153 against it.—Mr. Hume then renewed the motion for adjournment, on which Lord Stanley made some remarks, charging the opposition with obstructing the progress of the tariff.—Mr. Hume, however persevered, and ultimately the question of adjournment was carried.

Wednesday.—Sir R. Inglis presented a petition signed by 1,500 electors of the borough of Nottingham, against the suspension of the privilege of returning Members to Parliament, and praying that a new writ might issue for the election of a member in the room of Sir G. H. Larpent, who had accepted the Chiltern Hundreds on the 5th of May. Sir R. Inglis then gave notice of a motion on the subject which he would make on Thursday. On the order of the day for the further consideration of the report on the Salmon Fisheries (Scotland) Bill, Mr. Mackenzie moved that the report be taken into further consideration this day six months. After some discussion, the House divided, for the report, 88; for the amendment, 20; majority, 68. The report was agreed to, and ordered to be received on Friday. The Sudbury disfranchisement bill was read a second time. The bill for granting to coroners the power of admitting persons charged with manslaughter to bail, was negatived without a division, and the House then went into committee upon the Tariff.

Mr. Mangles renewed the motion which he had originated on the preceding night, for a greater reduction in the import duty on the cotton manufactures of India than was proposed in the Tariff. He said he desired this modification, not so much on account of its intrinsic importance, as for the sake of a just reciprocity between India and England. Mr. Gladstone pleaded the great inconvenience of loading the Tariff with minute distinctions. Mr. Hume contended for the principle, that whatever duty should be imposed on the import of any British commodity into a British colony, the same ought to be the duty on the import of the corresponding colonial commodity into England. Mr. Baring and several other Members took the same view of the subject, which was opposed by Mr. Goulburn. The committee then divided, and negatived the amendment by a majority of 42 to 26.

Mr. S. Wortley asked for a larger protection than this Tariff afforded to damask and diaper linen; the old duty having amounted to an absolute prohibition. Mr. Gladstone said, that the exportation of Yorkshire linen, which had for some years been steadily increasing, proved plainly that this manufacture was not likely to suffer from foreign competition. On the article of cotton wool, proposed in the Tariff to be charged 2*s.* 11*d.* per cwt., Dr. Bowring moved to impose only the nominal duty of one penny. He dwelt upon the severe and extensive distress of the manufacturing classes as a powerful reason for this relief. Mr. M. Philips seconded the motion. Mr. Gladstone admitted that the reasons adduced for this motion would be quite sufficient if there were a surplus revenue; but should this reduction upon cotton wool be agreed to, together with the reduction upon sheep's wool, which must needs accompany it, the country would have to provide for a deficiency of 800,000*l.* He did not entertain any great apprehension of foreign competition in this branch of manufacture. A discussion ensued in which several Members joined: and the House divided, when there appeared for the original proposition, 97; for the amendment, 44; majority, 53.

On all imports of sheep's and lamb's wool, Mr. C. Wood moved that the duty, instead of 1*d.* per lb. should be 1*s.* per cwt. He showed a diminution in our export of woollen cloth, and argued that the remedy must be sought in the cheapening of the raw material. Mr. Beckett seconded the motion. Mr. Gladstone assured the House that these duties had received the anxious consideration of Government, and that they were satisfied as to the policy of their reduction, so soon as the state of the finances would permit. But the woollen manufacture had not been wholly left out of consideration in the Tariff, as, for instance, the remission of the duties on vegetable oils and dye-stuffs, which would materially benefit the manufacturer. The amendment, after some discussion, was rejected by 122 to 65.

Mr. G. W. Wood moved that the duty on the import of sheep and lambs' wool, not being of the value of 1*s.* in the pound thereof, be reduced to 1s. per cwt. Mr. Gladstone opposed the amendment. The committee divided, for the motion, 47; against it, 96; majority, 49.

The remaining items of the schedule were then agreed to, and the House resumed. The Tithes Commutation Bill was considered in committee on the motion of Sir J. Graham, and several amendments were agreed to.—The reports of the Slave Trade Suppression (Hayti) Bill, of the Slave Trade Abolition (Argentine Confederation) Bill, and of the Slave Trade Treaties Bill, were brought up and agreed to.

Thursday.—There being only 34 Members present at 4 o'clock, the Speaker adjourned the House.

Friday.—After a conversation on the depreciation of the gold coinage, it was intimated by Sir James Graham that the Government do not intend to interfere in the Church of Scotland question.

The issue of the writ for Nottingham was moved by Sir R. H. Inglis, who, in the course of his speech, alluded to the ill-health of Sir G. Larpent. The motion was seconded by Mr. Gally Knight, who alluded to Mr. Roebuck as the "simon Pure" of the House. Mr. Roebuck indignantly denied the Purist character which was sought to be fastened on him, and declared that Sir R. Peel and the House were responsible for the issue of the writ. Sir R. Peel admitted that the ill-health of Sir G. Larpent might have been a sufficient cause for his retirement, but the fact of his immediate resignation immediately after an election committee had declared his election valid, formed sufficient ground for inquiry, and he should therefore vote against the issue of the writ. A division took place on the issue of the writ, which was lost by 136 to 41.

The Bribery Indemnity Bill then followed; and after some discussion and amendment it was read a third time and passed. The remainder of the evening was occupied in the discussion of the Tariff in committee. The schedules containing the duties on glass, earthenware, and silk manufactures were disposed of. A division took place on a proposition by Mr. Grimsditch, that the present duties on thrown silk be retained; when the Government proposition was sustained by 240 to 22.

CITY.

Money Market, Friday.—Consols for the account closed $91\frac{7}{8}$; Three per Cents. Reduced, 92; Bank Stock, 168; Three-and-a-half per Cents. Reduced, $100\frac{5}{8}$ to $\frac{3}{4}$; India Bonds, 23s. to 25s. premium; and Exchequer-bills, 48s. to 50s. premium.

Metropolis and its Vicinity.

Review of Cavalry by the Queen.—On Saturday her Majesty reviewed the two regiments of Life Guards and the 8th Royal Hussars, on the Review-ground, Wormwood Scrubbs, in the presence of a large number of general and other military officers, and a numerous assemblage of nobility and gentry. The Queen arrived on the ground at a quarter to 11, accompanied by Prince Albert, Count Mensdorff and his four sons, and at once proceeded, amid the enthusiastic cheering of the spectators, to the spot on the east side of the railway, where the Royal saddle-horses were stationed. At the entrance of the passage under the railroad her Majesty was received by the Duke of Wellington, Prince George of Cambridge, Lord Hill, and the Earl of Cardigan. The Queen wore the Windsor uniform, consisting of a blue riding-habit, with crimson facings; black round hat, with black lace veil; and wore across from the left shoulder the broad blue riband of the Order of the Garter. As soon as the Queen had mounted, her Majesty proceeded towards the troops, preceded by the Royal aides-de-camp, and followed by a numerous staff, in addition to which the retinue was increased by many ladies and gentlemen on horseback. Upon her Majesty taking her station in front, the band struck up the national anthem, and the troops presented arms. As the Queen proceeded along the line, the band played a Prussian march, and in passing the colours of each troop, her Majesty saluted them separately. The Royal party having returned to their station, the three regiments passed by in squadrons, the three bands playing the "1st Life Guards' March," composed by the Duchess of Kent. About 12 her Majesty, finding the sun too powerful, at the suggestion of the Duke of Wellington, ordered the head-quarters to be changed from the upper to the lower side of the Scrubbs, where the troops went through various manœuvres; after which they advanced in parade order, the bands playing "God save the Queen." Before leaving the ground the Queen expressed to the commanding officers her high approval of the appearance of the troops, and of the manner in which they had gone through the evolutions. About one o'clock her Majesty left the ground, and returned to Buckingham Palace.

Wood Pavement.—Another meeting was held of the vestry of Marylebone on Saturday, when the subject of wood-paving was again brought forward, and, after some discussion, a resolution, confirming the last minute of the vestry for paving Oxford-street with wood, was carried by 40 to 11, majority 29. This decision is considered to have finally terminated this long-litigated question.

Exeter Hall Musical Classes.—The second great choral meeting of Mr. Hullah's musical classes, instructed on Wilhem's system, took place at Exeter Hall, on Saturday. The attendance of visitors was very numerous, and among the more distinguished auditors were the Queen Dowager, the Duchess of Sutherland, the Dean of Chichester, Lord Wharncliffe, and several other peers and members of Parliament. The music sung was the same as that selected on the former occasion, and comprised the following pieces:—The 100th Psalm; an anthem by Farrant; the 95th Psalm; a motet, by Palestrina; the 149th Psalm; the Austrian Hymn, "God save the Emperor," adapted to English words by Mr. Chorley; and a madrigal, composed by B. Donato in the year 1550; besides several other pieces, the whole terminating with the national anthem. The pieces were, on the whole, well sung, and the performance received with loud applause by the audience. At the conclusion Lord Wharncliffe announced that a third great choral meeting would take place in a short time, in order to defray sundry expenses which had not yet been paid off. His Lordship praised the efficiency of the pupils, and exhorted them to continue their exertions, mentioning, as a stimulus to their abilities, that the Queen Dowager had been much delighted with the evening's performance. In the course of the evening the hall was unexpectedly visited by the Duke of Wellington, whose appearance, while one of the pieces was singing, caused great sensation. The singing was suspended, and all the assembly, both singers and auditors, rose unanimously, and loudly cheered his Grace.

East India House.—On Wednesday a ballot was taken at the East India House for the election of a director, in the room of Lieut.-Col. P. V. Agnew, deceased. There were three candidates, Major James Oliphant, E. Macnaghten, Esq., and J. Whiteman, Esq., and at the close of the poll, which terminated the same day, the election was declared to have fallen on Mr. Macnaghten; the numbers being for that gentleman, 785; for Major Oliphant, 782; and for Mr. Whiteman, 521.

Public Meetings.—On Tuesday the seventh annual meeting was held of the proprietors of the Bank of British North America, established for the purpose of extending banking facilities in the British North American colonies. The report stated that the affairs of the bank, notwithstanding the depression in trade and the unexampled derangement of monetary affairs in America, had continued prosperous. Directors believed that the indemnity fund would more than cover the losses sustained by the numerous failures in New Brunswick and Nova Scotia. The branches of Miramichi and Pictou had been closed in accordance with the resolution of last year. Of the 2,741 unsubscribed shares appropriated amongst the existing proprietors, a deposit of 10*l.* per share had been paid on 2,613. A half-yearly dividend of 24*s.* per share would be payable on the 5th July, the net profit for the year ending 31st Dec., being 11,678*l.* 9*s.* 6*d.*, or with the surplus, on the 31st Dec., 1840, 71,137*l.* 4*s.* 10*d.* Taking away the amount of the Midsummer and Christmas dividends of 1841, there remained a balance of undivided profits to 31st Dec., 1841, of 31,441*l.* 10*s.* 10*d.* After a few remarks from some proprietors the report was adopted.—On Tuesday the half-yearly meeting of the shareholders of the Grand Junction Canal Company was held. It appeared from the report that the net tonnage for the half-year ending 31st Dec. last has amounted to 62,238*l.* 18s. 9d., being 5,311*l.* 4s. 10d. more than in the preceding 6 months, and 4,599*l.* more than the corresponding period of the preceding year. The actual cost for the maintenance, &c. of the canal for the half year, including 2,000*l.* paid for rents, was 15,857*l.* 3s. 6d. besides which the committee paid 7,446*l.* 17s. 9d. in outstanding claims to the 31st Dec. No important progress has been made in the legal matter in dispute between the lord of the manor of Rickmansworth and the Company. The balance of the account to the 31st Dec. last being 46,581*l.* 18s. 2d., the committee recommended the payment of a dividend of 3*l.* 10s. per share, amounting to 40,092*l.* 10s. The revenue for the half year was as follows:—Net tonnage, 62,238*l.* 18s. 9d.; single boats, 868*l.* 19s.; wharfage, 310*l.* 13s. 9d.; rents, 5,927*l.* 14s. 6d.; casual receipts, 539*l.* 13s. 5d.; making together 69,885*l.* 19s. 6d. After the various payments, a balance of 46,581*l.* 18s. 2d. remained to the 31st Dec. 1841. The amount of unclaimed moneys to the 30th April 1841 was 15,366*l.* 10s. 1d. The report was adopted.

Accidents and Inquests.—On Saturday a serious accident occurred at Apothecaries' Hall. It appears that, in consequence of an order from the East India Company, the Apothecaries' Hall had undertaken, contrary to their usual practice, the preparation of fulminating mercury for the percussion-caps intended to be used in India. Mr. Hennell, the company's chemical operator, had been occupied two days in preparing about 6 lbs. of this article; and while thus employed, from some accident not known, as no one was with deceased at the time, the whole of the fulminating materials exploded, killing Mr. Hennell on the spot, and occasioning considerable damage to different parts of the building. With the exception, however, of deceased, no other person on the premises was injured; one man was knocked down by the violence of the explosion, but he escaped unhurt. The shock was so violent that it greatly alarmed the neighbourhood, and upwards of 1,000 panes of glass were broken by it. An inquest was held on Monday, when, after several witnesses had been examined, whose statements added nothing to the account given above, the jury returned the following verdict:—"That it was the opinion of the jury that the deceased, Henry Hennell, came by his death accidentally; and that, while the jury recommend the Society of Apothecaries to take every precaution to prevent a similar occurrence in future, they do not attribute any blame to the company under the existing circumstances."

The Parks.—It is stated that a greater number of persons have bathed in the Serpentine river, Hyde Park, during the present season than was ever before known. It appears that there have been from 7,000 to 8,000 bathers during the last week; and the water has been so crowded, that the constant attendance of the servants of the Royal Humane Society has been required, to prevent accidents; and several narrow escapes from drowning have occurred.

Suicide of Lord Congleton.—Some excitement was produced at the West End of the Metropolis on Wednesday, by the announcement that Lord Congleton, formerly Sir Henry Parnell, had committed suicide. From the evidence adduced at the inquest on Thursday, it appeared that his Lordship had for some time been in a declining state of health, in consequence of which he was subject to great lowness of spirits: and from the commencement of his illness he had laboured under a presentiment that he should commit self-destruction. The suicide of the Earl of Munster greatly affected him; and he was at the time heard to say that he was tempted to do the same. In consequence of this disturbed state of his Lordship's mind, it had been deemed prudent by his medical attendants and his family to keep strict watch over his actions, and to remove out of his way everything by which it was supposed he might be induced to commit suicide. Indeed, it appears that it was principally at his Lordship's own suggestion that his razors, sword, the bell-pulls of his apartment, and everything likely to tempt him to the commission of such an act, were taken from him. From the evidence of the medical man, however, it appeared that his Lordship had lately recovered in some measure from his indisposition; the morbid state of his mind and feelings was thought in a great measure to have passed off: and he was consequently not so strictly watched as he had previously been. On Wednesday morning he had risen as usual; and shortly after his barber had left him, one of the servants having occasion to go to his Lordship's room, discovered him suspended from the bed-post by his handkerchief. Medical assistance was procured; but every attempt at resuscitation failed, his Lordship being quite dead. After a lengthened investigation, the Jury returned a verdict that he hung himself, being at the time in a state of temporary mental derangement.

Fires.—From recent returns made by Mr. Braidwood, of the brigade force, of the number of fires which have occurred in the metropolis and its suburbs, it appears that during the last five months, from the 1st Jan. to the 1st June, 363 have taken place. During the same period last year the numbers were 371, and the year before 356 fires.

East India Trade.—Some sensation was produced in the City on Thursday by the announcement that Messrs. Briggs, Thurburn, and Co., of the East India trade, had suspended payment. Little appears to be known of the state of their affairs; but their debts and liabilities are estimated at about 200,000*l.*, and the non-receipt of remittances by the last three overland mails is stated to have caused their stoppage.

Mortality in the Metropolis.—The total number of deaths that have occurred in the Metropolis, from all causes registered, in the week ending Saturday the 28th ult., is 833.

Provincial News.

Bristol.—Our accounts from the provinces inform us that public meetings have very generally been held in the different cities and towns throughout the kingdom, for the purpose of addressing the Queen on the subject of the late treasonable attempt on her Majesty's life. The proceedings have in all cases been characterised by expressions of indignation and abhorrence at the attempt, thankfulness for the Queen's providential escape, and devoted loyalty and attachment to her Majesty's person. It is stated by a local paper that Prince Albert will honour the approaching Agricultural Meeting in this city with his presence.

Ely.—Considerable alarm was created in this city on Wednesday, by the sudden breaking out of a fire in the Cathedral. Every assistance was immediately procured: the entire population assembled, and by procuring water from the neighbouring wells, they fortunately succeeded, in the course of half an hour, in getting the fire entirely under before any serious damage had been done to the Cathedral. The fire originated in some sparks from a temporary fireplace, carried up for the purpose of heating the irons of the plumbers, who were at work on the roof at the time; and was first seen flaming through the interior by the verger on duty, it having happened during the performance of divine service.

Falmouth.—The Royal Mail Company's steamer, Dee, with mails from the Havannah, Jamaica, &c., arrived at this port on Thursday, having left the Havannah on the 13th, Nassau the 20th, Bermuda 25th May, and Fayal 3rd June. She brings intelligence of the total loss of the company's steam ship Medina, Capt. Burney, on the morning of the 12th May, by striking on a reef of rocks while entering Turk's Island on her outward route. The crew and passengers, among whom were the Earl of Elgin, the newly appointed Governor of Jamaica, and his Countess, were fortunately saved. His Lordship is said to have saved nothing from the wreck but his dispatches.

Lancaster.—We have received from a correspondent an account of a burglary committed on Saturday by a party of four men at Forton Cottage, the seat of Mr. Tongue, situated about six miles from this city. The robbers, who were disguised, effected their entrance by battering down the door with the trunk of a large tree; and, after seriously ill-treating Mr. Tongue and his servants, carried off all the money and other valuables they could find. They remained a considerable time in the house, having threatened Mr. Tongue that, if he made any alarm, they would take his life; and after regaling themselves with wine and the contents of the larder, they left the house about daybreak. An alarm was immediately afterwards raised in the neighbourhood, and information sent to the police of this city, but no trace of the thieves has yet been obtained.

Manchester.—A serious fire occurred in this town on Wednesday, by which property to the amount, it is said, of 8,000*l.* has been destroyed. The building in which the fire broke out was one of the oldest cotton-mills in the town, situated in Pin Mill Bow, and known by the name of the Pin Mill Factory. The fire was first discovered by a watchman passing, but at that time the flames appear to have already made considerable progress; and though every exertion was made to get them under, this was not effected until the whole of the premises were destroyed. Fortunately the fire was prevented from communicating to the adjoining houses. It is stated that upwards of 100 workmen will be thrown out of employment by the destruction of the mills, which will add seriously to the distress already existing among the operatives in this town.

Oxford.—On Tuesday a meeting of Convocation was held in this University, as announced in our last, when the motion for repealing the statute passed in 1836 against the Regius Professor, Dr. Hampden, was brought forward. The hall was crowded, and the greatest interest was manifested in the proceedings. The Vice-Chancellor first called on the Rev. Mr. Sewell, who rose, and in a Latin speech proceeded to argue against the right of the Heads of Houses to originate such questions, maintaining that the right belonged to the Convocation. The Vice-Chancellor refusing to put to the scrutiny the proposition of Mr. Sewell, that gentleman delivered in a protest, and declared his intention to appeal to the highest authority, the Queen in Council. Mr. W. Way then rose, and advocated the repeal of the statute in question. He insisted on the high talents and unimpeachable character of Dr. Hampden, and particularly on his great learning. He urged also that the original censure had not been justifiable, and called for its retractation as an act of justice. The Rev. Vaughan Thomas followed, and, in a speech of great power, which appeared to produce considerable effect on the audience, spoke against the revocation of the statute. Several other speeches were delivered, all being in Latin; and, finally, the Vice-Chancellor put the question, and a division took place, when the numbers were—For the repeal of the statute of 1836, 219; against it 334: majority, 115. The proceedings created considerable excitement, and the city has been filled with visitors, who arrived from all parts of the county to be present on the occasion.

Preston.—On Saturday evening the coach which runs between North Shields and Blyth was overturned near this town. It was heavily laden at the time, and the whole of the passengers were more or less injured, eight out of 13 persons being seriously hurt. The accident is stated to have occurred in consequence of two coaches running against each other.

Railways.—The following are the returns of the principal railways for the past week:—Brighton, 3,288*l.*; Blackwall, 1,002*l.*; Eastern Counties, 978*l.*; Greenwich, 980*l.*; Northern and Eastern, 1,467*l.*; Birmingham, 16,517*l.*; Great Western, 13,506*l.*; South Western, 7,640*l.*; Birmingham and Gloucester, 1,931*l.*; Birmingham and Derby, 1,136*l.*; North Midland, 3,957*l.*; Midland Counties, 2,501*l.*; Great North of England, 1,134*l.*; York and North Midland, 1,468*l.*; and Edinburgh and Glasgow, 2,064*l.*—On Monday, the annual general meeting of the Llanelly Railway Company was held. The report stated that twelve miles of the railway towards Llandilo are completed, and in the several branches fourteen and a half miles, making twenty-six and a half miles of railway; that cottages, sheds, and workshops have been erected; 325 new coal wagons completed, and 29 in course of completion; and there were three locomotive engines. The basin has been enlarged, shipping stages erected, and the channel widened; and the works generally so perfected that tonnage to a remunerating extent could be brought down the line, and shipped at the dock and basin. Since the last meeting the committee have entered into contracts for the supply of wagons and haulage power to the extent of 74,000 tons annually. The aggregate tonnage brought down by the old line was less by 8,327 tons than in the year preceding, but for the last three months it was much greater than in any preceding period. The total receipts to the 1st May, 1842, were 222,858*l.* 3*s.* 10*d.*; and the revenue account for the year ending the 30th April was as follows:—Railway dues on the old and new lines, 3,431*l.* 15*s.* 2*d.*; dock dues, 913*l.* 12*s.* 6*d.*; hauling produce, passengers, and parcels, 1,489*l.* 0*s.* 6*d.*; rent of houses, 119*l.* 4*s.* 2*d.*; together, 5,953*l.* 12*s*, 4*d.*; which, after the expenditure, left a balance of 26*l.* 0*s.* 11*d.*; but a sum of 2,078*l.* 7*s.* 10*d.* was due from sundry contractors. After some discussion the report was adopted. —A further trial of the Atmospheric Railway took place at Wormwood Scrubs on Monday. A number of scientific gentlemen, several members of Parliament, and some of the great London capitalists were present to witness the experiments, which are said to have been satisfactory. The speed attained was considerably above 40 miles per hour, and the vacuum varying from 24 to 25 inches of mercury.—The directors of the Great Western Railway Company, in accordance with the suggestions made in Parliament, have resolved to discontinue the system hitherto pursued of locking the doors of their railway carriages; and the new plan of leaving them unfastened came into operation throughout the line on Tuesday.

IRELAND.

Dublin.—The National Repeal Association held its usual weekly meeting on Tuesday, but the proceedings present nothing of interest. The amount of the Repeal rent for the week was announced to be 109*l.* 11*s.* 1*d.* The metropolitan police returns for the year 1841 have just been published, and tend to show that crime of all kinds is decreasing in this city. The number of persons charged with murder within the police district was, in 1838, 14; in 1839, four; in 1840, two; and in 1841, one. Burglaries appear also to have decreased in nearly the same proportion. In 1839 the number of persons arrested upon this charge was 76; in 1840 the number had fallen to 48; and in 1841 it was only 15. In the year 1838 there were 47 persons charged with breaking into and stealing from dwellings; and in 1841 these cases had diminished to four. There were eight cases of arson in 1838; and in 1841 there was one. The temperance reformation appears also to have effected a great change in the police returns. In 1838 there were taken into custody upon charges of drunkenness 18,698 persons; while, in 1841, the amount was reduced by one-third, the total being 13,204.

Clare.—Accounts have been received from Ennis, the assize-town of this county, stating that a collision took place on Monday, between the military and police and the peasantry of that town, in which two persons have been killed and twelve or fourteen others seriously wounded. The conflict was occasioned by an attempt on the part of a numerous mob to seize some flour mills, for the purpose of carrying off the flour. Several previous attempts of a similar character had been made, and a large body of police and military had been procured to protect the premises. The mob being warned to desist from their attack by one of the local magistrates, and refusing to do so, orders were given to the military to fire, in consequence of which two persons were killed on the spot and twelve or fourteen seriously wounded. The mob then dispersed, but considerable excitement continued to prevail in the town, and further investigation into the proceedings is expected to take place.

Londonderry.—We learn from the local papers that the total number of emigrants who have already left this port for America, during the present season, amounts to 5,936, consisting principally of small farmers and agricultural labourers.

SCOTLAND.

Edinburgh.—The sitting of the General Assembly closed on Monday, the 30th ult. We have given, in a previous Number, a report of its most important proceedings. After Mr. Cunningham's motion for the abolition of patronage had been carried, Dr. Chalmers brought forward a motion for the adoption of an "overture" on the subject of the jurisdiction of the kirk, which was carried by 241 to 110. The overture adopted is as follows: "That the General Assembly declare that they cannot, in accordance with the word of God, the authorised and ratified standards of the church, and the dictates of their consciences, intrude ministers on reclaiming congregations, or carry on the government of Christ's church, subject to the coercion attempted by the Court of Session as above set forth, and that at the risk and hazard of suffering the loss of the temporal benefits conferred by the State, and the advantages of an establishment, they must, as by God's grace they will, refuse so to do; for, highly as they estimate these, they cannot put them in competition with the inalienable liberties of a church of Christ, which, alike by their duty and allegiance to their head and king, and by their ordination vows they are bound to maintain, notwithstanding whatever of trouble or persecution may arise." A resolution, or "deliverance," adopted by the Assembly the day before its prorogation, approving of the report of the non-intrusion committee, is one confirmatory of the principles which the former condemnation, *in toto*, of patronage involved. The report says, "The only real evil which can befal the church is, that she should falter in adherence to her fundamental principle; but, through the mercy of her Great Head, she is now, in truth, more firmly united in adherence to that principle than she has ever been at any former period. The principle itself is plain; and the duty of the church in regard to it is not less plain." Dr. Candlish, in moving the approval of this report, concluded in the following terms: "Sir, we stand in this Assembly for the first time these many years; yes, for the first time this century, upon a footing that will, that must command the confidence of the Christian people of Scotland. We have broadly protested against patronage, and declared it to be a grievance; we have resolved to adhere to the independence of the church, and we have pledged ourselves to defend the rights of our people, and we shall honestly perform what we have said; we are not going to 'keep the word of promise to the ear and break it to the sense.' Sir, we have taken our stand against the encroachments of the civil courts, and is it consistent with the noble attitude in which we are placed to allow men, whether in office or out of it, to beat us down, and to deal with us in this miserable way—traffic and huckstering compromise—as if they were imposing some twopenny-tax, or laying upon us some trifling impost? No, sir; let us deal largely and liberally, and let us bring statesmen to do so too; for it is a great question of principle. Let us deal with it not considering it as only affecting *my* interests, or whether *I* can remain in the church, but a question affecting the interests of generations yet unborn—a question of principle, involving in it the liberty of the church and the constitution of the State." The Lord High Commissioner, in dissolving the Assembly, declared that he could not approve of its proceedings.

Glasgow.—Several large meetings of the unemployed operatives in this city have lately been held on Glasgow Green, at which the workmen have discussed the causes of their distress, and the best mode of alleviating it. At one of these meetings it was determined to proceed in a body to the city, for the purpose of soliciting charity, and accordingly they met in masses at the Royal Exchange, to commence a tour through the town for this purpose. These meetings and processions have caused great interruption to business and excited some alarm, and the police have been employed removing the obstructions and arresting some of the individuals concerned in them. A local paper informs us, that one individual, whose sympathies were excited by the appearance of so many men seeking bread, resolved on spending a sum of money for the purchase of loaves, and proceeded, accompanied by the greater portion of the unemployed, to a baker's shop, where he bought a considerable number of loaves, and handed them out to the crowd, by whom they were eagerly accepted. The pressure, however, became so great that the police were forced to interfere, and, for the protection of the gentleman himself, he was taken to the police office, where however he was at once set at liberty by the lieutenant on duty. The same paper adds that the relief committee have not as yet been able to meet the necessities of a large proportion of the labouring poor. At present about 4000 rations of soup and bread are distributed daily; 300 persons are employed at labour, either in breaking stones or levelling a piece of ground on the Milton estate, near to the Lunatic Asylum. An additional number will at once be set to these out-door employments, and about 200 webs will be given out for idle hand-loom weavers, thus extending the means of employment to 600 men; but even this, it is stated, will not meet the whole extent of the evil.

Leith.—Intelligence has been received of the total loss, by fire, whilst at sea, of the ship Barbara from this port. The fire broke out in the night of Sunday last in the German Ocean, about three miles from the Bell Rock Lighthouse; and the flames are described to have spread with such rapidity that those on board, amounting to 15 persons, were unable to save any property. Fortunately, however, they escaped by taking to the boats, and reached Montrose in safety, though much exhausted. The fire commenced in the hold of the vessel, but the circumstances under which it originated are at present unknown.

THEATRICALS.

HAYMARKET.—A new drama by Mr. Sheridan Knowles entitled "The Rose of Arragon," was produced at this theatre on Saturday, and met with decided success. The plot, which our space will not admit of our giving at any length, is briefly as follows:—The son of a King of Arragon falls in love with, and privately marries *Olivia*, the daughter of a wealthy peasant, called from her beauty the *Rose of Arragon*. The king, indignant at this act, resolves on setting it aside, sends his son to the army on the frontiers, and banishes *Olivia* from the palace. The result of this is a revolt among the people, who are already disaffected; the king is dethroned, and *Almagro*, a friend of *Olivia's* brother, who proves to be a perfidious and selfish villain, is appointed Regent of the Kingdom. *Almagro* then endeavours to gain possession of *Olivia*, of whom he has long been enamoured; and after a long train of cruelty on his part to effect his object, his plans ultimately fail; his treachery is discovered by his intimate friend, *Olivia's* brother, whom he has imposed on; and the *denouement* of the whole play is that the Prince, at the head of an army, returns at the critical moment when *Almagro* is about to compel *Olivia* to a forced marriage. He recovers possession of the kingdom for the King, his father, who then recognises his marriage with *Olivia*, and *Almagro* takes poison in despair. The acting throughout was well sustained; the principal characters being supported by Mr. and Mrs. C. Kean and Mr. Phelps, who were much applauded, and called for by the audience at the end of the play, which was announced for repetition.

Miscellaneous.

Sir Alexander Burnes.—The following narrative, derived from a Bombay paper, describing the circumstances attending the death of Sir A. Burnes, is furnished by a native servant who witnessed the transaction. It is probably the only authentic narrative of this melancholy event ever likely to appear before the public, and its perusal may be interesting to our readers:—DEPOSITION OF BOWH SINGH:—"Sir Alexander Burnes was duly informed by his Affghan servants the day previous to his murder that there was a stir in the city, and that if he remained in it his life would be in danger. They told him he had better go to the cantonments; this he declined doing, giving as his reason that the Affghans never received any injury from him, but, on the contrary, he had done much for them, and that he was quite sure they would never injure him. On the day of the murder, as early as three o'clock in the morning, a cossid (Wullee Mahomed) came to me. I was on duty outside. He said—'Go and inform your master immediately that there is a tumult in the city, and that the merchants are removing their goods and valuables from the shops.' I knew what my master had said on this subject the day before, so I did not like awakening him, but put on my chupras and went into the char choak. Here I met the Wuzeer Nuzamut Dowlah going towards my master's house. I immediately returned with him, and on our arrival awoke him, when my master dressed quickly, and went to the Wuzeer and talked with him some time; the Wuzeer endeavoured to induce him to go immediately into cantonments, assuring him it was not safe to remain in the city; he however persisted in remaining, saying, 'If I go, the Affghans will say that I was afraid, and ran away.' He, however, sent a note to Sir W. Macnaghten by Wullee Mahomed. A Chobdar came from the King to call the Wuzeer, who asked and obtained permission to go. At the door, the Wuzeer said to Sir Alexander Burnes, 'Why, you see already that some of Ameer Oollah Khan's people have collected to attack you; if you will allow me I shall disperse them.' He (Sir Alexander Burnes) said—'No; the King has sent for you; go to him without delay.' The Wuzeer accordingly mounted his horse and went away. The house gates were then closed, and were in a little time surrounded by Ameer Oollah Khan and his people. Hydur Khan, the late Kotwal of the city, whom Sir Alexander Burnes had turned out of office, brought fuel from the humam on the opposite side of the street, and set fire to the gates. The Wuzeer shortly returned from the Bala Hissar with one of the King's pultuns; on seeing the gates on fire, and the immense crowd about it, he took it apparently for granted that Sir A. Burnes had either escaped or been destroyed, and withdrew the regiment. At this time the whole mob of the city was collected, and the house in flames. The Jemidar of Chuprasses told Sir A. Burnes that there was a report of a regiment come to assist him. He was going up to the top of the house to look, and had got half way, when he met an Affghan, who said he had been looking about, and that there was not the least sign of a regiment. My master then turned back, and remarked that there was no chance of assistance coming either from cantonments or the King. A Mussulman, a Cashmeeree, came forward and said—'If your brother and chuprassees cease firing on the mob, I swear by the Koran that I will take you safe through the kirkee of the garden to the chandoul, the fort of the Kuzzilbashes; the firing ceased, and Sir A. Burnes agreed to accompany him, and for sake of disguise put on a chogha and loonge. The moment he came out of the door a few paces with the Cashmeeree, this wretch called out 'This is Sikundur Burnes!' He was rushed on by hundreds, and cut to pieces with their knives. His brother Captain Burnes, went out with him, and was killed before Sir Alexander; Captain Broadfoot was shot some time before in the house, and expired in half an hour. There was a guard of 1 Havildar, 1 Naik, and 12 Sepahis; they were all killed early in the affair; all the Hindoostanees, except myself were killed; his Sirdar Bearer, who is now with me, escaped, as he was at home; I got away by having an Affghan dress; all the Affghan servants deserted; I got into cantonments after being hid two days in a shop. Sir Alexander forbid the sepoys and others firing on the people until they set fire to the gates.'"

The Round Towers of Ireland.—Towards the close of last summer we announced to our readers that a discovery had been made of importance, in the elucidation of the mystery in which the origin of these structures was involved. We then gave details connected with the discovery of human remains within the foundation of Ardmore Tower. From that time to the present, we venture to affirm, more attention has been paid, and more of practical, rational investigation has been directed to the subject, than it ever previously received. We shall now proceed to state the discoveries made subsequently to that of Ardmore. In the month of September several of our fellow-citizens met by appointment, at Cashel, the Very Rev. Dr. Cotton, of Lismore, and Mr. Edward Odell, whose labours we before mentioned. The round tower was then examined. Although human remains were found within that structure, yet, because they were near the surface, mixed with earth and decayed timber, it was supposed they had been thrown in casually from the adjacent cathedral. But it is now to be noted that there was evidence of a previous delving; and the discoveries since made show at least a probability that the human bones there found had been disturbed from their original resting place within the foundation walls. It must, however, be admitted that the Cashel researches cannot be adduced as a positive instance of the sepulchral character of these towers. Not so with Cloyne; there, at a depth from the doorway of about 13 feet, being very near the same as at Ardmore, were found the bones of four human skeletons, lying in the direction from west to east. The space within which they lay was an irregular serrated oval of about six feet and a half by four. The Roscrea tower was opened three weeks since, at the request of our society, by Mr. E. Wall, of that town, who discovered human remains all through, from the doorway downwards, in a depth of over ten feet. The correspondence with Sir W. Betham has shown the success of the discoveries to which that learned and zealous antiquary has been instrumental. His noble friend the Marquis of Downshire caused to be opened the round tower of Drumbo. The tower of Maghera has also been opened, in both of which were found human remains. Similar results had previously attended the opening of the tower on Ram Island. Two most remarkable instances remain to be mentioned. We have the authority of Sir W. Betham that in the tower of Timahoe there were not only human bones, but the sepulchral urn was found; and by Mr. Black's history, we learn that in Abernethy tower (Scotland) human skulls and bones were found in great numbers, and there was also discovered an urn. These two facts prove that Timahoe and Abernethy towers, at least, were pagan structures, and leave a strong presumption in favour of the same inference with regard to the others.—*Cork Reporter.*

SPORTING.

ASCOT HEATH RACES.—These fashionable and attractive races commenced on Tuesday. The fineness of the weather and the presence of the Queen combined to draw a more numerous attendance than usual on the first day. Her Majesty, accompanied by Prince Albert, Count Mensdorff and his four sons, with a numerous suite, arrived on the Heath about one o'clock; and in her progress to the Royal stand, her Majesty was greeted with continued and enthusiastic cheers by the crowds who thronged the Grand Stand and the sides of the course. The Queen left immediately after the race for the Gold Vase, amid similar demonstrations of loyalty and attachment on the part of the company. The races, which did not begin till nearly two o'clock, commenced with

The Trial Plate of 50l., added to a Sweepstakes of 5 sovs. each. The New Mile (7 *subs.*)—Lord Westminster's Satirist, by Pantaloon (Robinson), 1; Sir J. Gerard's Meal, 2; Mr. Goodman's Rover, 3; Mr. Charlton's Lasso, 4; Mr. Payne's Rapture, 5; Mr. Osbaldeston's Sister to Alexandria, 6; Mr. Theobald's Glenury, 7. Betting—5 to 4 agst Satirist, and 6 to 4 agst Meal. The running was made at a slow pace by Meal, Lasso and Rapture lying up with her, and Satirist in the rear; they ran in this order to the road, where the speed mended, not without affecting the front rank, which continued as we have described it to be to the distance, where Satirist headed his horses, went on with the running, and won in a canter by two lengths; Rover passed Lasso half way up the distance, and obtained a very bad third place.

Sweepstakes of 200 *sovs. each. Swinley Course* (6 *subs.*)—Lord Westminster's Auckland (Robinson), 1; Lord G. Bentinck's Firebrand, 2; Col. Anson's The Puncher, 3. Betting, 5 to 4 on Auckland (who carried 2½ lb. over weight), and 5 to 4 agst Firebrand; the Puncher not mentioned. Firebrand made all the running at a moderate pace, the favourite lying off up to the distance, where he reached her quarters: at the stand he went to the mare's head, staid with her to the last, and won on the post by a neck easy.

The Ascot Stakes of 25 *sovs. each, with* 100 *added; the second to receive* 50 *sovs. out of the Stakes.* 2½ *miles.* (51 *subs., of whom* 32 *declared.*—Mr. Forth's Vibration, by Sir Hercules (Bell), 1; Mr. Forth's Hyllus, 2; Mr. Isaac Day's Tamburini, 3; Mr. Thornhill's E. O., 0; Mr. S. Scott's Mosque, 0; Lord Chesterfield's Rhodanthe, 0; Col. Peel's I-am-not-aware, 0; Mr. Gregory's Una, 0; Lord Villiers's Snowdrop, 0; Mr. Hornby's Revoke, 0; Lord Westminster's William de Fortibus, 0. Betting, 4 to 1 agst Rhodanthe and Tamburini, 6 to 1 agst Mosque, 5 to 1 agst I-am-not-aware, 8 to 1 agst E. O. and Vibration, and 9 to 1 agst Hyllus. The first running was made by I-am-not-aware and Mosque, right and left of whom, and well laid up, were Rhodanthe, Snowdrop, Tamburini, E. O., and William de Fortibus; behind them, Una and Revoke; and three or four lengths in the rear of all, Hyllus and Vibration. At a good, but not superior pace, the position continued as we have described to the top turn, when Rhodanthe took the lead from I-am-not-aware, and made strong play to the turn for straight running, by which time Snowdrop, I-am-not-aware, Revoke, and Mosque had had enough of it. Hyllus and Vibration, who had been creeping up from the old mile post, now showed in front, headed Rhodanthe at the distance, and finished the race, Vibration winning easy by a length. Tamburini was a bad third, Rhodanthe fourth, and I-am-not-aware fifth.

The Gold Vase, given by her Majesty, added to a Sweepstakes of 20 *sovs. each. Two miles* (10 *subs.*)—Mr. Pettit's St. Francis (Robinson), 1; Mr. Combe's The Nob, 2; Mr. Ord's Beeswing, 3. The following also ran: Sir G. Heathcote's Pannakeen, Lord Exeter's Bosphorus, Lord Chesterfield's Jack, Lord G. Bentinck's Yorkshire Lady, and Mr. Combe's Rosalind. Rosalind made play at a steady pace, followed by Beeswing, two lengths behind whom was St. Francis, The Nob lying fourth, and Jack fifth. No change worthy of notice took place until they reached the last turn, where St. Francis took up the running, Beeswing being second, Rosalind third, and The Nob fourth: they ran thus to the stand, where The Nob passed Rosalind, and a splendid race ensued, St. Francis winning on the post by a head, and The Nob beating the old mare by half a neck. Rosalind was a respectable fourth.

The St. James's Palace Stakes of 100 *sovs. each. Old mile.* (11 *subs.*)—Lord G. Bentinck's Misdeal, by Camel (Rogers), 1; Mr. Greville's Gunter, 2; Lord Stradbroke's Jeremy Diddler, 3; Mr. Thornhill's Espartero, 4. Betting, 7 to 4 agst Misdeal, and 5 to 2 agst Espartero. Gunter made the running to the turn, where Espartero took it up; Misdeal laid off to the stand, where he went a-head, and won easy by a couple of lengths.

Two-year-olds Sweepstakes of 50 *sovs. each. Three quarters of a mile.* (4 *subs.*)—Sir G. Heathcote's b. c., by Glaucus, Cantatrice (Nat) 1; Mr. Goodman's Botherem, 2. Betting, 6 to 5 on the Glaucus colt, who made a waiting race, and won on the post by a neck.

The Ascot Derby Stakes of 50 *sovs. each. Swinley Course.* (16 *subs.*)—Duke of Bedford's Envoy (Robinson), 1; Lord Chesterfield's Sir Harry, 2; Sir G. Heathcote's Arkansas, 3. Betting, 3 to 1 on Sir Harry, who was beaten in a canter: Arkansas was half distanced.

Sweepstakes of 50 *Sovs. each.* 20 *ft. Cup Course.* (4 *subs.*)—Mr. Thornhill's Espartero walked over; Mr. S. Lacus's The Traitor withdrew his stake.

WEDNESDAY.—The attendance of company was not numerous, the interest felt in this day's races being usually much less than in those of Tuesday and Thursday. The following is an account of the running, which commenced with

The Swinley Stakes of 25 *sovs. each. Last mile and a half.* (5 *subs.*)—Mr. Shelley's Iole, walked over.

The Coronation Stakes of 100 *sovs. each. New mile.* (11 *subs.*)—Lord Exeter's f., by Touchstone out of Amima (Mann), 1; Lord Chesterfield's Dil bar, by Touchstone, 2. Betting, 6 to 4 on the Amima filly, which made what running there was, and won by half a length.

Sweepstakes of 100 *sovs. each. Old mile.* 9 *subs.*—Mr. Gregory's Barrier (Robinson), 1; Lord Westminster's Auckland, 2; Sir G. Heathcote's Hydaspes, 3; Mr. Rush's c. by Plenipotentiary, out of Maresfield's dam, 4. Betting, 5 to 4 on Auckland, 5 to 2 agst Barrier, and 7 to 2 agst Hydaspes. Barrier made the running at a steady pace, followed by Hydaspes, Auckland third, and the Plenipo colt about two lengths in his rear. The speed and places continued thus to the distance, where Hydaspes gave way, and Auckland took his place in attendance on Barrier. At the half distance they closed, and made so brilliant and close a finish, that until the Judge had awarded the victory to Barrier by a head, it was impossible to say which had won.

Plate of 50*l. The winner to be sold for* 200*l. Swinley Course.*

—Mr. Wreford's f. by Taurus—Escape (Howlett)	0	1
Mr. Balchin's Dromedary	0	2
Lord Rosslyn's Cornuto	3	0

The following also started: Gen Wyndham's Aspatria, Mr. Hervey's Saracena, Mr. J. Day's Mulciber, Mr. Coleman's Guzelle, Mr. Booth's St. Jean d'Acre, and Mr. Goodman's c. by Langar, d. by Cervantes. Betting, 3 to 1 agst the winner, 4 to 1 agst St. Jean d'Acre, 5 to 1 agst Cornuto, and 6 to 1 agst Mulciber. St. Jean d'Acre and Mulciber made strong running to the distance, where Dromedary, the Escape filly, and Cornuto left the crowd, and made a beautiful race home, the first two finishing with a dead heat, beating Cornuto by half a length; the others were tailed off. For the deciding heat it was 6 to 4 on the Escape filly, which made all the running, and won by a full length.

Her Majesty's Plate of 100 *guineas. From the New Mile-post once round and in.*—Mr. Nightingale's Ajax (Sly), 1; Lord Westminster's Satirist, 2; Mr. Thornhill's E. O., 3. Betting, 4 and 5 to 1 on Satirist, and 8 to 1 agst Ajax. Ajax took the lead at a slow pace, followed by E. O., the favourite lying a couple of lengths behind the latter; they ran thus till near the top turn, where a dog ran into the course right in front of Satirist, who went over him, and was nearly over the ropes; at this moment Ajax increased the pace, and with a lead of several lengths ran nearly round the course, Satirist never approaching him until he reached the stand; Robinson then made an effort, but failed, Ajax winning cleverly by three-parts of a length, without having been headed.

THURSDAY.—This being the great day of the races, the "Gold Cup" day, the course was crowded from an early hour; and long before the amusements of the day commenced, the Heath was covered with thousands of visitors. The fineness of the weather added greatly to the enjoyment of the sport, and the presence of the Queen with a numerous Suite, as on Tuesday, gave additional interest to the scene. Her Majesty, who was again enthusiastically received, arrived on the course about one, and left immediately after the race for the Gold Cup. A few minutes after the Queen's arrival the racing began in the following order:—

The Windsor Castle Stakes of 100 *sov. each. The new mile.* (4 *subs.*)

Lord Exeter's f. by Touchstone, out of Amima	(Mann)	1
Lord G. Bentinck's Misdeal		2

Betting—Even on the filly, 2 to 1 having previously been laid on the horse. The filly made all the running, and won cleverly by half a length.

The Buckingham Palace Stakes of 200 *sov. each. Swinley Course.* (11 *subs.*)

Mr. Greville's Gunter, by Bay Middleton	(Nat)	1
Lord G. Bentinck's Flytrap		2
Lord Exeter's Albion		3

Betting—5 to 4 agst Flytrap, 7 to 4 agst Gunter, and 3 to 1 agst Albion. Gunter took the lead at starting, was never caught, and won in a canter by two lengths; a fine race for second.

The Windsor Town Plate of 50l. The winner to be sold for 100l. T.Y.C

Mr. Graydon's Miss Heathcote, by Velocipede,	(F. Butler)	1
Lord G. Bentinck's African, by Mulatto		2
Lord Exeter's Patchworth		3

The following were not placed:—Mr. Legge's Decision; Capt. Gardnor's Ben Brace; Mr. Dicker's Little Nell; Mr. Goodman's Music; Mr. Worley's Conjugation; Mr. Garrard's The Dandy; and Capt. Ives's Folly. Betting—5 to 2 agst Miss Heathcote, and 4 to 1 each agst African and Folly. Won by two lengths after an indifferent race. Patchworth a bad third, Folly a bad fourth. The winner was claimed by Lord G. Bentinck.

The Coburg Stakes of 100 sov. each. (9 *subs.*)—Mr. Gregory's Barrier, walked over.

The Gold Cup, value 300 sov., by Sub. of 20 sov. each, with 200 add. About two miles and a half. (11 *subs.*)

Mr. Orde's Beeswing, by Dr. Syntax	(Cartwright)	1
Mr. Combe's The Nob		2
Mr. Pettit's St. Francis		3
Mr. Thornhill's Eringo		4
Mr. Kirby's Lanercost		5

Betting—Even on Lanercost, 7 to 2 agst St. Francis, 4 to 1 agst The Nob, 6 to 1 agst Beeswing, and 20 to 1 agst Eringo. Eringo was first from the post, and kept in front for a quarter of a mile; the mare then overpowered her jockey and went away with a good lead, followed by Eringo, Lanercost lying third, The Nob fourth, and St. Francis last. In making the top turn the pace became severe, but no alteration in the places were observable until they reached the brick kiln, where Lanercost was beaten, and at the turn he was last in the race. Eringo held the second place to the Stand, where The Nob passed him and challenged the mare—for a moment he headed her, but the "pride o the north" resumed her position in a couple of strides, and, after a fine race, won by half a length. St. Francis was a good third; the others were beaten off. Lanercost pulled up lame. The race came off at half-past three.

Sweepstakes of 100 *sov. each. New Mile.* (7 *subs.*)—.

Lord Westminster's Auckland	(Robinson)	1
Sir G. Heathcote's Dark Susan		2
Lord Exeter's Saros		3
Lord G. Bentinck's Muley Hassan		4

Betting—3 to 1 on Auckland. Muley Hassan led at a bad pace to the road, where Auckland took it up, and with Dark Susan at his heels, went on to the end, winning easily by a length.

Sweepstakes of 30 *sov. each. T. Y. C.* (3 *subs.*)—

Mr. Coleman's Jamal	(Nat)	0	1
Mr. Ford's Spiteful		0	2
Col. Wyndham's Tom Thumb		3	0

Betting—Even on Spiteful, 7 to 4 agst Tom Thumb, and 2 to 1 agst Jamal. Jamal made all the running to the stand, where Spiteful quitted the waiting system, reached his head, and made it a dead heat on the post. Tom Thumb was beaten off. The deciding heat was won by a head only, Jamal the favourite.

The Grand Stand Plate of 100 *sov.* (*handicap*). *Once round and a distance.*

Mr. Mare's Argos	(Crouch)	1
Mr. Gardnor's Monops		0
Mr. Combe's Rosalind		0

The following also started: Col. Peel's I-am-not-aware, Mr. Wyndham's Nora Creina, Mr. Shelley's Daddy Longlegs, Lord G. Bentinck's Yorkshire Lady, Mr. Osbaldeston's Sister to Alexandrina, Lord Exeter's Revision, Mr. Lichtwald's Miss Stilton, and Mr. Graydon's Helpmate. Betting—3 to 1 each agst Rosalind and Miss Stilton, 9 to 2 agst Monops, 5 to 1 agst I-am-not-aware, and 6 to 1 agst Nora Creina. Nora Creina, Miss Stilton, and Revision laid in front to the straight running, where Argos headed them, and after a fine race won by a neck. A dead heat for second between Monops and Rosalind.

MARK LANE, FRIDAY, JUNE 10.—We have had very little English Wheat up since Monday which has been taken off at fully that day's quotations.—For free Foreign the demand has been limited, but we do not observe any alteration in its value; in floating cargoes and bonded there is little doing, the holders generally being firm in their demands, which buyers are unwilling to comply with.—Barley, Beans, and Peas, are each 1s. dearer. Oats have also advanced 1s. per qr., but the demand is not so lively as on Wednesday, although still active for bonded at fully 2s. over Monday's prices.

GAZETTE OF THE WEEK.

INSOLVENTS.—T. Watts, Rugby, Warwickshire, licensed-victualler—T. Armstrong, Abchurch-lane, merchant—John Steggall, Guildford-street, publisher.

BANKRUPTCIES SUPERSEDED.—T. Atkinson, Lancaster, grocer—H. Brayne, Nine Elms, Battersea, coal merchant.

BANKRUPTS.—T. Ginger, Leighton Buzzard, Bedfordshire, innkeeper—W. Laurence, Lombard-street, money scrivener—Josiah Barlow, Manchester, hatter—J. Brettargh, Pendleton, Manchester, timber-dealer—T. Jones, Brecon, Breconshire, woolstapler—N. M'Leod and C. B. Yarrow, Liverpool, ship-brokers—G. P. Kennan and A. Samson, Manchester, calico printers—H. M. Walker and T. Cosson, Manchester, corn factors—T. Barter, Poole, surgeon—R. Russell, Bradford, Yorkshire, provision dealer—R. B. Thompson, Wood-street, Cheapside, warehouseman—H. Stevens, Willian, Hertfordshire, and J. Stevens, Clophill, Bedfordshire, builders—S. Forster, Gateshead, Durham, ironfounder—W. G. Smith, Vauxhall-walk, Surrey, surgeon—S. D. Moss, Rochdale, draper—O. Johnson, Maldon and Great Braxted, Essex, coal merchant—M. Bower, Birmingham, gilt toy manufacturer—J. Atkinson, Leeds, builder—H. Baird, Gloucester, grocer—J. Triggs, Southampton, upholsterer—J. Mills, Clapham, ship owner—B. Parkin, D. [illegible], and J. Farrar, Bristal, Yorkshire, cotton-warp doublers—Thomas Tatham, Burton in-Lonsdale, lime-burner—D. Whatley, Cirencester, Gloucestershire, scrivener—W. Kempster, South Weald, Essex, innkeeper—J. Pearson, Kingswinsford, Stafford, maltster.

SCOTCH SEQUESTRATIONS.—J. Allan, Edinburgh, grocer—J. Alexander and Son, Glasgow, wrights and builders—T. Taylor, Perth, ironmonger—Geo. Fairley and P. Houston, Glasgow, builders—Wm. Wilkie, Edinburgh, paper-stainer—W. Horton, Glasgow, merchant.

BIRTHS.—On the 27th ult., at Guy Harlings, Chelmsford, the lady of Dr Badeley, of a son—On the 4th inst., at Leamington Priors, the lady of Andrew Wight, Esq., of Ormiston, of a son—On the 7th inst., at Addlestrop-house, the Lady Eleanor Cathcart, of a daughter—On the 8th inst., at the Parsonage, St. St. George's, Camberwell, the lady of the Rev. S. Smith, of a son—On the 8th inst., at Bleak-hall Villa, New Park-road, Clapham-park, Mrs. J. M. Dods, of a son.

MARRIED.—On the 7th inst., at Leckhampton, Gloucestershire, J. Patrickton, Esq., of the Madras army, to Isabella Helen, daughter of the late George Nicholls, Esq.—On the 9th inst., at St. George's Church, Hanover-square, G. C. Yarborough, Esq., of Campemount, in the county of York, to Mary Louisa, youngest daughter of R. Heathfield, Esq., of Green-lanes, Stoke Newington.

DIED.—On the 4th instant, at Hackney, Mr. G. H. Toulmin, R.N., aged [illegible] years—On the [illegible] inst., Rosa, the wife of Henry Talbot, Esq., of Oatland, near Kidderminster, aged 70—On the 7th inst., C. Harris, Esq., of Coventry, aged 67—On the 7th inst., at Ryde, Isle of Wight, F. P. Stubbs, Esq., of Hyde Park-place, formerly of Long-acre—On the 8th inst., in Arbour-street, Commercial-road, S. Galilee, Esq., in the 87th year of his age—On the 9th instant, Allimia, daughter of the Lord Bishop of Worcester—On the 10th ult., at Toronto, Upper Canada, Emily, the lady of Mr. Justice Hagerman, and daughter of W. Merry, Esq., of Cheltenham.

MAUND'S BOTANIC GARDEN.
Large, 1s. 6d.; small, 1s.

A MAGAZINE OF HARDY PLANTS, interesting to every Cultivator of an open Flower-garden. It is published monthly, and contains four finely-coloured figures of Plants, executed on Steel or Copper, in the line manner of Engraving, the expense of which has never deterred the Proprietor from continuing it, in preference to the loose and undefined prints produced by lithography and other cheap methods.

THE FLORAL REGISTER, included in each number, contains sixteen nicely engraved Woodcuts, with much information in little compass. The AUCTARIUM, too, given therewith, contains much gardening information, original and selected.—Back numbers or volumes may be had. See Advertisement in last week's *Chronicle.*

London: Simpkin and Marshall; and Sherwood and Co.

Just published, price 15s., demy 8vo, cloth,

THE STRUCTURE & DISTRIBUTION of CORAL REEFS. Forming the First Part of the Geology of the Voyage of H. M. S. Beagle; with Maps and Woodcuts. By CHARLES DARWIN, M.A., F.R.S., F.G.S.

Also, just published,

THE LADIES' FLOWER-GARDEN OF ORNAMENTAL ANNUALS. 48 Plates. Cloth, price 2l. 2s.

THE LADIES' FLOWER-GARDEN OF ORNAMENTAL BULBOUS PLANTS. 58 Plates. Cloth, price 2l. 12s. 6d.

London: Published by William Smith, 113, Fleet-street.

This day is published, price 21s., cloth, or Royal 8vo, the paper adapted for colouring, 2l. 2s.

THE HERALDRY OF FISH.—Notices of the principal Families bearing Fish in their Arms.
By THOMAS MOULE.

⁂ Nearly 600 Families are noticed in this work. Besides the several descriptions of Fish, Fishing-nets, and Boats, are included also Mermaids, Tritons, and Shell-fish. Nearly 70 Ancient Seals are described, and upwards of 20 Subjects, in Stained Glass. The Engravings, 205 in number, are from Stained Glass, Tombs, Sculpture and Carving, Medals and Coins, Rolls of Arms and Pedigrees.

This Work has been noticed in the "Gentleman's Magazine" for June; "John Bull," May 7; "United Service Gazette," May 14; "Gardeners' Chronicle," May 14; "Globe," May 17; "Atlas," May 28; and "Athenæum," June 4.

John Van Voorst, 1, Paternoster-row.

A new Edition, considerably improved and enlarged.

LOUDON'S ENCYCLOPÆDIA of GARDENING; the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape Gardening, including all the latest Improvements, a general view of Gardening in all Countries, and a Statistical View of its present State, with Suggestions for its future progress in the British Isles, &c. With nearly 1000 Engravings on Wood, 50s. boards.

II.

A New Edition, with SUPPLEMENT, of

LOUDON'S ENCYCLOPÆDIA of PLANTS; a Description of all the Plants in Great Britain, down to 1840, with nearly 10,000 Figures, by Branston, from Drawings by J. D. C. Sowerby, F.L.S. One thick vol. 8vo, 3l. 13s. 6d. cloth.

⁂ The SUPPLEMENT, edited by J. C. Loudon, prepared by W. H. Baxter, Jun., and revised by Geo. Don, F.L.S., with upwards of 800 additional Figures, separately, price 15s.

III.

LOUDON'S ENCYCLOPÆDIA of AGRICULTURE. Third Edition, with nearly 1300 Wood Engravings, one large vol. 8vo, price 2l. 10s. cloth lettered.

IV.

Arthur Willis, Esq.
George Fred. Young, Esq.

NOTICE IS HEREBY GIVEN, that Ships will be regularly despatched on the 1st day of every month during the present year, to one or more of the Company's Settlements of Wellington, Nelson, and New Plymouth.

In the Wellington District the Sales take place by Auction, and an allowance of 25 per cent. is made towards the passage-money of purchasers arriving from England.

Lands in the Nelson Settlement are sold in this country at the price of 300l. per allotment; comprising 1 town acre, 50 acres of accommodation, and 150 acres of rural land. Purchasers receive passage allowances not exceeding 25 per cent. upon their purchase-moneys.

Lands in New Plymouth are sold in this country to actual colonists at 75l. per allotment of 50 acres; and a town lot, with passage allowances not exceeding 25 per cent.

The Company continues to offer a Free Passage to Agricultural Labourers and Mechanics of good character, and eligible according to the regulations.

Maps and Views of the Country may be seen, and all necessary information obtained, by application at this House.

By order of the Court,
JOHN WARD, Secretary.

New Zealand House, Broad-street Buildings,
19th May, 1842.

SHIPS FOR NEW ZEALAND.—NOTICE IS HEREBY GIVEN, that the following Emigrant Ships have been Chartered by the New Zealand Company to sail from the ports and on the days undermentioned, viz.—

FOR NELSON.
OLYMPUS, A 1, 316 Tons, from London, June 15th.
NEW ZEALAND, A 1, 380 Tons, from Greenock, July 1st.

FOR WELLINGTON.
GEORGE FYFE, A 1, 391 Tons, from London, June 15th.

FOR WELLINGTON and NEW PLYMOUTH.
BLENHEIM, A 1, 374 Tons, from Plymouth, July 1st.

Applications for Free Passage by labouring persons duly qualified are received daily at this House.

By order of the Court,
JOHN WARD, Secretary.

New Zealand House, Broad-street Buildings,
19th May, 1842.

BUDDING'S PATENT MOWING MACHINE, manufactured by J. FERRABEE, Phœnix Foundry, near Stroud, Gloucestershire, and sold wholesale by Messrs. J. R. and A. RANSOME, Ipswich, on the same terms as at the Manufactory.—In the *Gardeners' Chronicle* of the 14th May last, W. F. Lindsay Carnegie, Esq., of Kimblethmont, near Arbroath, gives an account of a new Mowing Machine made for him by Mr. Shanks, of Arbroath; to be drawn by a horse, and which cuts a breadth of 42 inches. After stating that the invention is still the subject of a patent in England in favour of Mr. Budding, Mr. Carnegie says, "The inapplicability of whose machine to large spaces had long been a subject of regret to me." Fearing lest any one may think, from this statement, that extensive lawns cannot be mown by a smaller machine, I beg to state that any extent may be cut equally well with a small as with a large machine; the only difference being the times it takes in doing it.

Having made arrangements with the Patentee for the manufacture of all the machines during the term of the patent, I continue to supply them to cut respectively breadths of 16 in., 19 in., and 22 in., to be worked by hand; and from 26 in. and upwards, to be drawn by a horse. Mr. Carnegie having taken pains and incurred considerable expense in bringing to perfection a machine to cut so large a breadth as 42 in., I have, at his request and by authority of the Patentee, agreed to license Mr. Alexr. Shanks, of Arbroath, to sell the large Horse Machines in England; and to any Nobleman or Gentleman having an extensive lawn and wishing to have one of them, I shall be most happy to give every information in my power.

Stroud, June 9, 1842. JOHN FERRABEE.

THE DEANE'AN PLATE has all the whiteness, and much more than the durability of Silver. The Spoons and Forks manufactured of this beautiful metal are of precisely the same shape and finish as the best London-made Silver Plate. Each article is stamped with the maker's name—"DEANE'S, London Bridge."

WHITE TEETH. ROWLAND'S ODONTO, or PEARL DENTIFRICE.—This is an efficient White Powder for the Teeth, solely prepared from Oriental Herbs of the most delightful odour, and of sovereign virtue for strengthening, preserving, and thoroughly cleansing the Teeth. It eradicates tartar from the Teeth, removes spots of incipient decay, polishes and preserves the enamel, to which it gives a pearl-like whiteness; and, above all, from its disinfecting properties, gives sweetness to the breath. As an antiscorbutic, the gums also share in its transcendent powers. Scurvy is eradicated from them, a healthy action and redness are induced, that offer to the notice of the medical practitioner the most indubitable signs of their healthful state. Price 2s. 9d. per box, duty included. ⁂ NOTICE—The Name and Address of the Proprietors, A. ROWLAND AND SON, 20, Hatton Garden, London, are engraved on the Government stamp which is pasted on each.

⁂ Be sure to ask for "ROWLAND'S."

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, June 11, 1842.

Wilson, for a Cantaloup Melon; 21, to Mr. Edmonds, gr. to His Grace the Duke of Devonshire, for Peristeria pendula; 22, to Mr. Goode, gr. to Mrs. Lawrence, for Achimenes longiflora; 23, to Mr. Goode, gr. to Mrs. Lawrence, for Pavetta caffra; 24, to Mr. Barnes, gr. to G. W. Norman, Esq., for Ixora coccinea; 25, to Mr. Bruce, gr. to B. Miller, Esq., for Elichrysum humile; 26, to Mr. Falconer, gr. to A. Palmer, Esq., for Polygala oppositifolia.

THE CERTIFICATE OF MERIT.—1, to Mr. Beck, for a Seedling Pelargonium: 2, to Mr. T. Basset, of Bodmin, for a Seedling Pelargonium; 3, to Mr. Barnes, gr. to G. W. Norman, Esq., for Seedling Calceolarias; 4, to Mr. Green, gr. to Sir E. Antrobus, Bart., for Seedling Calceolarias; 5, to Mr. Brown, gr. to Messrs. Clews, for Black Hamburgh Grapes; 6, to Mr. J. Fish, gr. to H. H. Oddie, Esq. for Melons; 7, to Mr. Leslie, gr. to J. Fleming, Esq., M.P. for Strawberries and Cherries; 8, to Mr. Elliott, gr. to J. B. Boothby, Esq., for Strawberries; 9, to Mr. T. Baldwin, of Turnham Green, for Apples and Strawberries; 10, to Mr. Barnes, gr. to G. W. Norman, Esq., for Leschenaultia formosa: 11, to Mr. Falconer, gr. to A. Palmer, Esq., for Erica depressa; 12, to Mr. Saulter, gr. to J. M. Yeeles, Esq., of Bath, for Erica tricolor; 13, to Mr. Bruce, gr. to B. Miller, Esq., for Achimenes longiflora: 14, to Mr. R. Forrest, of Kensington, for Statice arborea; 16, to Mr. Gaines, of Battersea, for a Seedling Digitalis.

FLORICULTURAL SOCIETY of LONDON.—

The Third SHOW of this Society will take place on TUESDAY, the 21st inst., at the Crown and Anchor Tavern, Strand, when numerous PRIZES will be awarded for PINKS, RANUNCULUSES, PELARGONIUMS, HEARTSEASE, and ROSES, independently of a SILVER CUP OF THE VALUE OF FIVE GUINEAS, presented by D. SHEARES, Jun., Esq., for a Collection of 36 ROSES, in single Blooms; together with First and Second Class Prizes for as many Seedlings as may be produced deserving of them. The Seedlings to be shown as follows:—

Pinks	1842	..	1 Bloom.
	1841	..	6 Blooms.
Heartsease..	1842	..	1 Bloom.
	1841	..	6 Blooms.
Pelargoniums	1841	..	the Plant.
	1842	..	a Truss.

Seedlings may be forwarded to the Secretary on the morning of the Show, by 11 o'clock, carriage paid, together with the entrance-money of 1s. each.

T. C. WILDMAN, Hon. Sec.

At the Show of Carnations and Picotees on the 19th July, a SILVER CUP WILL BE PRESENTED BY DR. LINDLEY, for the best first-class Seedling PICOTEE of the present year.

WEST LONDON GRAND FLORICULTURAL EXHIBITION,

for Prizes of Two SILVER CUPS, and 23 MEDALS, under the Superintendence of Mr. J. T. Neville, will be held in the Grounds of the Almshouses of the Butchers' Charitable Institution, at Walham Green, Fulham Green, Fulham, on Wednesday, the 22d, and Thursday, the 23d June.

Also a LADIES' BAZAAR and FANCY FAIR, under the Patronage of Her Gracious Majesty Queen Adelaide, in aid of the Building Fund.

Military and Quadrille Bands will attend. The Gates will be opened at 12 o'clock each day. Admission, One Shilling.

JAMES NESS, Sec.

4, Dyer's Buildings, Holborn.

PELARGONIUM SOCIETY.

THE OBJECT of this SOCIETY is to form a fund expressly devoted to supplying Prizes for SEEDLING PELARGONIUMS. The first distribution will take place at the Meeting of the Horticultural Society, at Chiswick, on July 9th. Subscription 1*l*. per annum. Gentlemen desirous of contributing to the Fund, are requested to address their letters to Mr. Fox, 3, Charles-street, Covent Garden. The prizes, which the Society can afford to offer, will be announced the week previous to the Show.

SUNBURY NURSERY, MIDDLESEX.

S. T. WILLMER, Florist to Her Majesty, will have Plants of 20 new superb PINKS to send out in September, at 5*s*. per pair. Cooper's Prince Albert, large red-laced, back tier flower; Cooper's Princess Royal, fine violet-laced, with rose leaf, constant, fine show flowers. Blooms of them may be seen at Messrs. Warner and Co.'s, Cornhill; Mrs. Johnson's, Grand-row, Covent Garden; and Willmer and Son's, King's-road, Chelsea.—June 16.

ROSES.

MESSRS. LANE and SON, GREAT BERKHAMPSTED, Herts, have the honour to inform their Friends that their extensive Collection of ROSES, &c., are now in BLOOM; and they can state with confidence that those who favour their Nurseries with a visit during the season will be highly gratified.

The Trains leave Euston-square, London, at the following hours: 7, 8, ½-pt. 1, 3, and 6 respectively; returning at 7, 9, 11, and 12, 20 m. pt. 4, and 20 m. pt. 8. The Nurseries are about a quarter of a mile from the Berkhampsted station. All the Trains stop at Tring, 4½ miles beyond Berkhampsted; and persons arriving too late for the Berkhampsted Trains, may avail themselves of this opportunity.

ROSES.

T. RIVERS, Jun., respectfully informs his Friends that his Collection will be in full blow from the 18th or 20th inst. The Collection is of much greater extent, and, he flatters himself, will prove this season more interesting than any previous.

Trains per Northern and Eastern Railway run from London at the following hours, stopping at Harlow and Sawbridgeworth Stations alternately, both of which are equidistant from the Nursery, viz., one mile:—Morning, 8 o'clock, ½ past 9, ½ past 11; Afternoon, ½ past 1, ½ past 3, ½ past 4, and 8 o'clock. The journey is performed by the Trains in one hour: the last up-train is at ½ past 6.—Sawbridgeworth, June 9th.

ROSES.

E. DENYER, NURSERYMAN and FLORIST, Loughborough-road, North Brixton, near London, begs to inform his Friends and the Public that his splendid COLLECTION OF ROSES are now in bloom, and worthy of inspection. He has increased his last year's stock with all the new varieties worthy of notice, and informs them that the period of blooming is the best time for orders to be given, as a better selection, as to colour, form, &c., can then be made.

ROSES.

MESSRS. PAUL & SON, Florists, &c., Cheshunt, Herts., having been requested by many admirers of the ROSE to give notice when their Collection would be in the greatest perfection of bloom, have the pleasure of announcing the PRESENT TIME, and flatter themselves, that whoever visits their grounds will be highly gratified.

To the numerous company who honoured them with a visit last season they beg to intimate, that their Collection this season will prove doubly interesting in consequence of the numerous additions of new and fine Roses received from abroad.

Cheshunt is only 13 miles from London, situated on the high road from London to Hertford and Ware, being a delightful carriage-drive from the West End, [illegible] and Theobald's Park, or through Tottenham and Waltham Cross.

The Northern and Eastern Railway also affords a cheap and expeditious method of reaching the Nurseries, trains running from London to Waltham Cross in the short space of half an hour, from whence a coach runs to the Nurseries in ten minutes.

N.B.—The trains run from the station, High-street, Shoreditch, eight times daily, and return eight times, all stopping at the Waltham Cross Station.

Cheshunt Nurseries, June 18, 1842.

ARAUCARIA IMBRICATA.—W. SKIRVING,

WALTON NURSERY, LIVERPOOL, begs leave to offer to the Public his extensive Stock of this interesting hardy Tree, at the following Prices, viz.—

2 years' old from Seed	. . .	5s. each.
3 ,, ,,	. . .	10s. 6d.
4 ,, ,,	. . .	21s.

W. S. also offers fine Plants of Araucaria Braziliensis, 2½ feet high, at 42s. each; and some very fine specimens of that most beautiful of all trees, the Araucaria excelsa, five to six feet high, at Ten Guineas each. The above Plants are all in pots, and can be sent safely to any part of this Kingdom, or the Continent.

ARAUCARIA IMBRICATA.

MESSRS. W. and F. YOUELL beg respectfully to inform the Nobility and Gentry who are desirous of enriching their Arboretums and Plantations with this truly ornamental and hardy tree, that they are offering fine strong Plants, 2 years old, from seed, in pots, at 5s. per plant, 60s. per dozen, or 20*l*. per 100, which they will warrant perfectly hardy, having had several hundred standing fully exposed to the severity of the late winter, without receiving the slightest detriment, in a situation completely open to the north-easterly gales, and within 500 yards of the wash of the sea.

Those who are unacquainted with the habit and description of the above can obtain an engraving, taken from a plant in the Arboretum of the Earl of Orford, together with a description, by enclosing 4 postage stamps. To be obtained also of their Agents, Messrs. Flanagan and Co., 9, Mansion House-street; and of Messrs. Noble, 152, Fleet-street, London.

CEDRUS DEODARA.

Fine Plants of this elegant and ornamental hardy tree may also be obtained of Messrs. W. and F. Y., at the following prices:

3 years old, from seed, 9 to 11 inches, 84s. per dozen.
2 ,, ,, 5 to 7 ,, 63s. ,,

Great Yarmouth Nursery, Norfolk, May 19, 1842.

GREAT YARMOUTH NURSERY.

NEW AND DISTINCT FUCHSIAS. — Messrs. YOUELL have much pleasure in submitting the following enlarged List of their Superb Collection of FUCHSIAS. Every care has been observed in selecting only those that possess great beauty and distinctness; and will be found to contain all the beautiful varieties sent out by various parties this season, which they can confidently recommend:

Hybrida coccinea	2	6	Youelii .... 2 6 to	3	6

The above will be sent, post free, to any part of the United Kingdom (on the receipt of a post-office order), at the rate of 21s. per dozen varieties, the selection being left to Messrs. Y.

THE NEW GERANIUM—"LYNE'S SUNRISE,"

which obtained the Gold Medal at the Plymouth Horticultural Show last week, and which created such an extraordinary sensation at the Exeter Horticultural Show last Thursday, can be ordered of Mr. W. E. RENDLE, Union-road Nursery, Plymouth, by whom the Stock has been purchased, at Three Guineas each.

LYNE'S SUNRISE.—The colour is of a bright rosy orange, very large flower, and of the most perfect form.

Union road Nursery, Plymouth, May 26, 1842.

TO THE AMATEURS OF ROSES.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WILLIAM WOOD and SON have the honour to announce to their Friends and the Floricultural Public in general, that their unrivalled and most extensive collection of ROSES, consisting of many thousands, both Standards and Dwarfs, cultivated on upwards of 14 Acres, and comprising every variety known that is worthy of cultivation, are now in splendid bloom, and will continue flowering until the end of the Rose season.

W. W. and SON beg to state that their collection is not surpassed by any other in Europe.

Coaches to Lewes daily from the Golden Cross, Charing-Cross, passing through Maresfield.

Woodlands, June 10th.

LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, Album, and Punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

TO NURSERYMEN AND FLORISTS.

JAMES PAMPLIN, NURSERYMAN, Walthamstow, Essex, begs to acquaint Nurserymen and Amateurs that his SPLENDID PELARGONIUMS, which have been so much and justly admired, viz. — Enchantress, Camilla, Van Amburgh, Anna, Alice Grey, &c. &c. &c.; together with many New and Splendid Seedlings not yet in the possession of any other person, are now in Bloom, and may be seen at his Nursery.

Walthamstow, June 9th, 1842.

WILLIAM MAY begs to announce that he is now sending out his SIX NEW FUCHSIAS for 30*s*., and his SIX NEW CALCEOLARIAS for 42*s*. "Lady Constable" Calceolaria, if separate, at 21*s*. each; this plant will be sent post free. He has also a few collections of his splendid SPANISH CHRYSANTHEMUMS left. Descriptive Lists may be had on application.—Hope Nursery, Leeming-lane, near Bedale, Yorkshire, June 10th, 1842.

CHEAP SHOWY PLANTS FOR FLOWER-BEDS.

WILLIAM BARRATT begs to offer to Floriculturists, as below, CALCEOLARIAS, GERANIUMS, VERBENAS, FUCHSIAS, PANSIES, DAHLIAS, and other free-blooming Garden Flowers, at 4*s*. to 6*s*. per dozen; strong Plants ready for planting out. A fine collection of the above plants in named sorts, as well as other Greenhouse and Herbaceous plants for Rooms and Greenhouses.

About 10,000 GREENHOUSE HEATHS and EPACRISES, in fine health; worthy the attention of the Amateur and Nurseryman.

*** NATURAL GRASSES for permanent pasture, in selected sorts. Persons ordering these should give the quantity of ground, the situation and quality of the soil, and for what purpose wanted; doing this they may rely on having the proper kinds, and at not above one-third more expense than the old mixtures of Hay-seeds, which are very uncertain in producing good Herbage. Also, DWARF LAWN GRASSES; as much seed as will sow 100 square yards for from 3*s*. to 4*s*.

Wakefield Nursery, May 1842.

M. WATERER begs to inform the Nobility and Gentry that his Exhibition of American Plants will CLOSE on Saturday next, the 18th, but will remain open to Ladies and Gentlemen, wishing to select any of the plants, till Wednesday next, the 22nd, till which time persons will be in attendance to receive any Orders, when they will be removed to the Nurseries at Knap Hill and Bagshot, where further Orders will oblige.

King's Road, Chelsea, 16th June, 1842.

SPLENDID SALE of the WOODHALL COLLECTION OF EXOTICS.

There will be Sold by Auction, within the Gardens of Woodhall, in the parish of Bothwell, and County of Lanark, lying 10 Miles east of Glasgow, between Airdrie and Holytown, on THURSDAY, the 28th day of JULY next, and following day, commencing at 11 o'clock each day, the whole of that extensive and celebrated COLLECTION of HOTHOUSE and GREENHOUSE PLANTS, consisting of numerous rare and valuable species, among which are many magnificent specimens of Camellias, Heaths, Epiphyllums, Citrons, Oranges, Shaddocks, Zamias and other Palms; with a very extensive and superior variety of Pelargoniums (Geranium), Indian Azaleas, and other miscellaneous Greenhouse and Stove Plants; of which Catalogues may be had by applying to Mr. Murray, of the Botanic Gardens, Glasgow; Messrs. Austin and M'Aslan, Nursery and Seedsmen, Trongate, Glasgow; Woodhall Office, 33, Buchanan-street, Glasgow; or to the Gardener by Holytown.

The collection of Camellias is well known as not surpassed by any in the Empire, the specimens being of the very finest growth, many of them from 15 to 20 feet in height. The Heaths also afford numerous specimens of the finest sort, which for size and furnishing, it is believed far surpass any collection ever shown.

The whole of the Plants are in the very best state of health; and as the operations of the mineral workings on the estate have already encroached upon the garden, they must be sold off, as it is, in consequence of the said operations, to be entirely broken up: therefore, great bargains may be expected. The Plants will be set up in Lots to suit purchasers, beginning with the Camellias, Heaths, Epiphyllums, &c.

The collection may be viewed any day prior to the Sale, by applying at Woodhall Garden. Further information learned, and particulars given, on applying to the Factor, Woodhall-house, Holytown.

BARCLAY and SKIRVING,
Auctioneers.

Woodhall-house, May 1842.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

BRITANNIA LIFE ASSURANCE COMPANY,
1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l*. for whole term of Life.

Age.	Annual Premium payable during 1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.
20	£1 1 4	£1 5 10	£1 10 11	£1 16 9	£2 3 8
30	1 6 4	1 12 2	1 19 1	2 7 4	2 17 6
40	1 16 1	2 4 4	2 14 6	3 7 3	4 3 4
50	2 16 7	3 9 4	4 5 5	5 6 3	6 13 7

PETER MORRISON, Resident Director.
A liberal commission allowed to Solicitors and Agents.

WESTERN LIFE-ASSURANCE SOCIETY.— OFFICE—49, PARLIAMENT STREET, WESTMINSTER.
Capital 500,000*l*.—10,000 Shares, 50*l*. each.
Deposit 5*l*. each Share.

This Society is established for the Assurance of Lives, upon principles combining economy with perfect security.

Directors.

Henry Edgeworth Bicknell, Esq., 28, Upper Bedford-place.
William Cabell, Esq., Newington-place, Surrey.
Thomas Somers Cocks, jun., Esq., Charing Cross.
George Henry Drew, Esq., Bermondsey.
William Evans, Esq., Millbank.
William Freeman, Esq., Millbank-street.
Francis Fuller, Esq., Poultry, London, and Croydon.
James Hunt, Esq., Whitehall.
John Arscott Lethbridge, Esq., Greenwich Hospital.
Edmund Lucas, Esq., Millbank-street.
George Kennet Pollock, Esq., Great George-st., Westminster.
James Lys Seager, Esq., Millbank.
John Bazley White, Esq., Millbank-street, and Swanscombe.
Joseph Carter Wood, Esq., Artillery-place, Westminster.
Henry Wrench, Esq., King William-street, London Bridge.

Trustees.—William Whateley, Esq.; L. C. Humfrey, Esq.; George Drew, Esq.
Auditors.—Ormus Biddulph, Esq.; John Freeman, Esq.; John Bazley White, jun., Esq.
Consulting Counsel.—William Page Wood, Esq.
Conveyancing Counsel.—Samuel Jay, Esq.
Physician.—William Richard Basham, Esq., M.D., 17, Chester-street, Grosvenor-place.
Surgeons.—Alfred Leggatt, Esq.; George David Pollock, Esq.
Bankers.—Messrs. Cocks, Biddulph, and Co., Charing Cross.
Solicitors.—Messrs. J. L. Bicknell and J. C. Lethbridge, 25, Abingdon-street, Westminster.

TABLE OF PREMIUMS to assure £100 for the whole term of Life.

Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.
20	1 14 2	35	2 11 0	50	4 3 3
25	1 18 11	40	2 19 6	55	5 5 4
30	2 4 8	45	3 9 1	60	6 15 3

The object of this Society is to afford to the Assured all the benefits of Life-Assurance, at a great reduction in the rates of Premium.—FOR EXAMPLE—A person aged 30, may with this Society assure his life for 500*l*. by the annual payment of 11*l*. 3*s*. 4*d*., which in a Society where the bonus is held out as a main inducement, would cost him 13*l*. 7*s*. 4*d*., or, in other words, for the same annual premium he could at this Office assure very nearly 600*l*., whereby he derives AN IMMEDIATE AND CERTAIN BONUS OF 100*l*.

All particulars as to Shares, Loans, Assurances, &c., may be obtained on application to the Secretary; and, if required, forwarded to the country.

Parties in the country eligible for undertaking Agencies are requested to apply.

A very liberal Commission allowed to Solicitors and Agents.

EDW. T. RICHARDSON,
Actuary and Secretary.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hot-houses, Conservatories, and Private Houses, by means of Hot-water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted-up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and dispatch.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

TO NOBLEMEN AND GENTLEMEN.

WANTS a SITUATION as GARDENER.—A Married Man, aged 37, of first-rate abilities, is desirous of obtaining a situation in the above capacity. He perfectly understands the management of Pines, Vines, Peaches, and Apricots; also the Forcing of Raspberries, Figs, Lettuces, French Beans, and Cauliflowers, during all the winter months, together with every kind of Early Forcing; also the Kitchen, Flower-garden, and Wood Plantations. Can have the highest testimonials for sobriety, &c. from the situation he has last lived in, also from the most eminent authority in the kingdom.—Address to G. H. N., care of Mr. Cole, 21, Liquorpond-street, London,—which will meet with immediate attention.

WANTS a SITUATION as GARDENER, a Steady Man, who has a scientific knowledge of Plants; the Forcing of Pines, Vines, Peaches, &c.; also Early Cucumbers, French Beans, and Mushrooms.—Direct M. S., 15, Coventry-street, opposite the Haymarket, London.

WANTS a SITUATION as GARDENER, a Single Man, aged 30. Has a perfect knowledge of his business in all its branches, and can be well recommended from his last situation, where he lived two years.—Address A. B., Mr. Francis, 2, Gilbert-street, Oxford-street.

WANTS a SITUATION as FOREMAN, or to take charge of the Houses, a young Man who has had six years' experience in first rate Gardens, and can be well recommended, having filled similar situations. Direct J. B., to the care of Mr. Stein, Nurseryman, Highgate.

WANTS a SITUATION as GARDENER a Married Man, aged 26; he has a general knowledge of the business, and is a good Plantsman. Can have a good character from the Gentleman he is leaving. Address, post-paid, to D. P., Botanic Garden, Cambridge.

WANTS a SITUATION as GARDENER a Married Man, without encumbrance; he has a thorough knowledge of the business, can manage Forest Plantations, and Meadow Land, if required. Reference unexceptionable. Address, post-paid, to A.M., Botanic Garden, Cambridge.

WANTS a SITUATION as GARDENER, a Person aged about 50 years, who is thoroughly acquainted with his profession, in which he has been very successful; he is a first-rate grower of Plants, Forced Fruits, &c., as well as a general Gardener, and is well versed in Ornamental and Forest Planting. He is a married Man, with Two Children. Terms 75*l*. a-year, with House, Coals, &c. found.—Address W. B. G., Post-office, Northallerton, Yorkshire.

WANTS a SITUATION as PRINCIPAL GARDENER, a Married Man, 32 years of age, who has had 20 years' practical experience: with 5 years' good character from his last place. A situation where subjects are grown for Exhibition would be preferred.—Direct, A. B., Mr. Jno. Smith, Nurseryman, Dalston.

WANTS EMPLOYMENT, a steady Man, about 45 years of age, who has been in Business as Nurseryman and Florist. He is a good hand at Pruning, Nailing, Propagation, Budding, Grafting, Layering Flowers, &c.: is a useful persevering man: can manage Land, Stock, &c., if required, and can be strongly recommended. Wages 21*s*.—Direct to Lycopodium, care of Messrs. Lockhart, 156, Cheapside, London.

GARDEN SEATS, FLOWER STANDS, WIRE WORK, GREENHOUSES, &c.

J. CRIPPS, No. 11, MARKHAM PLACE, KING'S ROAD, CHELSEA, Wire Worker by special appointment to her Majesty Queen Victoria, the Dowager Queen Adelaide, and her Royal Highness the Duchess of Kent, begs respectfully to inform the Nobility and Gentry that he has at present on hand, the largest stock in London of Rustic and other Garden Seats, Chairs, Stools, Tables, Flower Stands, Mignonette and Plant Boxes, Wire Work of every description, as Arches for walks, Flower Bordering, Trainers for plants, &c. &c. J. C. also constructs Forcing Houses, Conservatories, Greenhouses, Verandahs, Alcoves, and Summer Seats, Invisible and Hare-proof Fences, Gates, &c.; in short, almost every decorative appendage to the Rural Residence.

Plans and Estimates submitted for works in contemplation. Blinds of every description made, repaired, altered, or painted.

In One Volume, small 8vo., price 5*s*.

ELEMENTS OF AGRICULTURAL CHEMISTRY AND GEOLOGY. By JAMES F. W. JOHNSTON, M.A., F.R.SS. L. & E., Honorary Member of the Royal Agricultural Society, Reader in Chemistry and Mineralogy in the University of Durham.

Publishing in Monthly Numbers, price 6*d*.
By the same Author,

LECTURES ON AGRICULTURAL CHEMISTRY AND GEOLOGY. The numbers published may be had done up in Parts. Part I., price 6*s*.; Part II., price 4*s*. 6*d*.

"We heartily recommend both to the attention of British Agriculturists."—*Blackwood's Magazine.*

Printed for WILLIAM BLACKWOOD AND SONS, Edinburgh and London.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.

The Number for June, 1842, contains highly-finished drawings of *Epidendrum phœniceum*, *Fuchsia cordifolia*, *Lobelia heterophylla* var. *Major*, and *Clerodendron splendens*; likewise Papers on Gardening as a science; Advantages of removing decaying Flowers; Tender Climbers for Summer Purposes; Floricultural Notices of new or beautiful Plants figured in the leading Botanical Periodicals for May, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.

The last Exhibition will take place on Saturday, the 9th of July. Subjects for Exhibition must be at this Office on Friday, the 8th of July, or at the Garden before half past Eight o'clock, A.M., on the day of Exhibition. The Gates will be opened at One, **P.M.—Tickets are issued to Fellows at this Office**, price 5s. each; or at the Garden in the afternoon of the days of Exhibition at 10s. each; but none will be issued without an order from a Fellow of the Society.—21, Regent-street.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. **Gentlemen wishing to distribute copies among their** cottage tenantry may have them *delivered in any part of London* by remitting a Post office order to this Office, at the rate of 5s. for every 25 copies required.

The Gardeners' Chronicle.

SATURDAY, JUNE 18, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Horticultural	3 P.M.
	Linnean	8 P.M.
	Floricultural	2 P.M.
Wednesday	Medico-Botanical	8 P.M.
	Microscopical	8 P.M.
Saturday	Royal Botanic	3½ P.M.

COUNTRY SHOWS.—June 21, Beulah Spa. 23, Cork.

NEVER before did the good people of Turnham Green behold such a scene as was presented last Saturday to their astonished eyes. As early as four o'clock in the morning, the notes of preparation for the Horticultural Society's Exhibition were sounded by the carpenters employed in erecting awnings, and in completing the arrangements at the gates. Then succeeded great numbers of carts, waggons, vans, and other vehicles, bringing multitudes of the finest flowers in the world to the show; but by half-past eight in the morning this had ceased, and it was only the early risers who knew that the Gardens were already filled with the beautiful objects that were afterwards to attract, within their sphere, an eager and mighty crowd.

As the day drew on, however, water-carts were seen plying at an unusually late hour; mounted and foot police began to gather; carriage after carriage slowly dropped into line; caravans of soldiers with their musical instruments passed within the garden gates, and by one o'clock there was a crowd. From that hour until seven in the evening, the arrival of visitors was incessant. The three gates of admission were choked up; the greens, the lanes, the roads, and every field that had an authorised inlet, became crammed with horses and all sorts of carriages; and at last thirteen thousand five hundred and eighty-two visitors passed into the Gardens beneath a sun whose rays struck 100° upon even the least crowded spaces within the walls, and must, where there was much reflection, have beaten even more fiercely than that. By nine o'clock in the evening, the whole had disappeared like a vision; flowers, visitors, carriages, horses, and servants innumerable were gone; and it might have been doubted whether anything unusual had occurred, if witness to the scene had not been borne by the publicans' cellars, which were as dry as the high-road; for as to ale, porter, ginger-beer, soda water, or such other drinkables as coachmen and their friends delight in, it became useless to ask for them, and some persons doubted whether the pumps would continue to do their duty.

As to the exhibition, it was even finer than that of May. The wondrous beauty of the Orchidaceæ, would alone have rewarded the visitor for the dust and fatigue and annoyance, inseparable from a crowded meeting near London, in the hottest of hot weather. The number of exhibitors was unusually large, as may be supposed from the fact, that a hundred and twenty medals were awarded.

While, however, we admit to the fullest extent, the variety of the flowers, and the extraordinary beauty of the exhibition as a whole, there are some points to which we think it necessary to advert.

The fruit was unworthy of the scene. The very hot and dry weather that had been experienced for some time previously ought to have enabled gardeners to bring forward an abundance of produce in this department; and yet the judges were unable to find one collection deserving of the highest reward offered by the Society. Some good fruit there was, no doubt; and Sir Geo. Staunton's Musa was a fine object; but these were the exceptions to the rule. We confess we do not understand this. The prizes offered for fruit are as large as those for flowers; the expense of conveyance backwards and forwards is defrayed by the Society, and all fruit is returned to the owners. Why, then, does it not come? Is it because the skill of forcing gardeners is on the decline? It is for them to answer that question on a future occasion.

With regard to Roses, they no doubt were greatly injured by the causes which ought to have been advantageous to the fruit. Nevertheless, we may appeal to all who saw them for a confirmation of our opinion that a large number of varieties were of inferior quality. It seems to us as if the Rose-growers were again striving after novelty of any sort; regardless of merit; and if that be so, they will do themselves mischief; for the effect can only be, that buyers will be disappointed at novelties not being as beautiful as older kinds, and will cease to lay their money out. Perhaps the societies who offer medals at public exhibitions are to be blamed for this state of things; for they have, one and all, neglected to establish any rules for judging Roses, or to determine what it is that really constitutes a fine variety. It is highly desirable that something should be speedily settled respecting this matter; and we invite our correspondents to favour us with their ideas concerning it. We, in the meanwhile, shall shortly proceed to point out what appear to us to be the points that have really rendered Roses such universal favourites. The question is much more complicated than that of florists' flowers.

A subject of complaint has been the dust experienced on the road from London to Turnham-green. We might content ourselves with saying, that the roads are under the control of Commissioners, and that the Society, how much soever it may regret the annoyance to visitors, has no power to abate the evil. It would be, however, unjust to the Commissioners if we were not to add, that in fact the roads were watered as long as it was practicable, and as far as the means at their disposal would permit. The truth is that no attainable amount of watering would suffice to remove the dust. The thermometer stood at 100° in the sun, and had been nearly as high for a fortnight before; the roads were as hard and hot as if they had been baked; and, to say nothing of the heat produced by the friction of numberless iron wheels upon the granite soil, the mere temperature of the surface was enough to dry up half-a-gallon of water upon a square yard every ten minutes. Supposing this estimate to be correct, and in fact it is within the truth, a little calculation will show the utter impossibility of contending with the fierce sun and his parching rays. The road occupied by carriages in motion was five miles long, and seventeen yards wide on an average. In watering this effectually, 74,800 gallons would be required every ten minutes for five hours; or on the whole *two million two hundred and fifty-four thousand gallons*, or about as much as *five thousand water-carts would hold.* To abate such a nuisance, nothing short of turning a river over the road could have sufficed.

But a greater misfortune was the failure of Mr. Gunter's arrangements for supplying ices and similar refreshments. With this, however much it was to be lamented, it is proper to state that the Society had nothing to do. The Society provides Mr. Gunter with room, covering, and accommodation of all sorts, and Mr. Gunter takes all the duty upon himself—in consideration of which he has whatever the profit or loss of the undertaking may be. He has for many years carried through his operations without accident and without complaint; it is, therefore, only reasonable to suppose, that if he failed on the late occasion, it was from causes against which the greatest experience and enormous means could not guard him. It is of no use blinking the question; his arrangements did, in fact, entirely break down, as well as the refreshment tables, which were thrown down. But why? We wish to say nothing about the importunity of the visitors, every one of whom wanted his ices at the same moment; for in such difficult situations heat of temper may be fairly laid to the account of the heat of the weather. The great cause of all the inconvenience that was sustained was this: those who obtained their refreshments, instead of waiting at or near the tables to consume them, carried them away into the grounds, very naturally thinking that an ice would have little effect in cooling the inward fever if introduced into the stomach beneath a direct temperature of 120°. So, in order, as we have said, to enjoy their ices, the fortunate possessors of them carried them off into the grounds. Now this would have been of little consequence, had the spoons, and plates, and glasses, in which said ices had been supplied, been left behind. Unfortunately, however, it was necessary to carry them off too; and as it was too much to think of pressing through the crowd to return them, they were left in the garden. After standing this run upon the crockery for an hour or two, Mr. Gunter began to find his stock of glasses, spoons, and plates disappearing, no one knew whither: we hear it was suggested that, by some new chemical process, they had been converted into eatables and drinkables, and so had vanished. In fact, however, they *had* disappeared, and no more were to be procured. Of ice there were buckets full; of lemonade abundance, as we are informed; But neither the one nor the other could be *handed* out between the fingers: so in time affairs came, as they say, "to a dead lock." At last, by some dire mishap, the tables were all pushed down; the small remaining stock of crockery and glassery was demolished; and then it was over. Of what happened afterwards we know nothing. It was very unfortunate—particularly disagreeable—both to Mr. Gunter and his visitors; but it could not be helped. What we describe is what we understand to be the facts; for we were not there—and the only consolation is, that where Gunter fails, who can hope to succeed? We do not believe there is another purveyor of good things in London who has the courage even to make the attempt.

It is with great pleasure that we can close these remarks with a well-deserved compliment to Mr. Superintendent Williamson and his force of police. With nearly fourteen thousand visitors to the garden, three or four thousand carriages, with coachmen, footmen, horse-boys, grooms, and loiterers innumerable, there was not a single serious accident. One gentleman was thrown from his horse, the poney of a mail-cart was capsized, and these two formed the whole chapter of accidents, great and small. Of confusion, indeed, there was enough, for how could it be otherwise, when the line of vehicles was five miles long, and the carriages in waiting choked the road from Hammersmith Broadway to Kew-bridge, Chiswick, and Strand on the Green? Such a sight was never indeed seen before; the mélée was pronounced by old soldiers who were present to be worse than the battle of Waterloo, barring the balls; and the police, who were on hard duty in that broiling sun for eight hours, were so exhausted, that they could scarcely leave the ground. Yet it all passed away like a dream, without a casualty to damp the pleasure that, after all the discomforts, did attend it.

WE cannot wonder that the unmeasured language held by Professor Liebig towards his contemporaries should have brought forth its fruit; for "curses are like young chickens—they always come home to roost." The manner in which he thought fit, in his book upon Organic Chemistry, to speak of vegetable physiologists, and the ignorance of their views which he at the same time manifested, evinced a degree of bad taste which we sincerely regretted to see in a man of such high chemical reputation. We, however, never thought it worth anything further than a passing comment (see p. 40 of the present vol.); his own countrymen, on the contrary, have treated his unjust attacks upon them somewhat differently; and we trust they will have read this gentleman a salutary lesson; for he seems to have overlooked the importance of the old maxim—not to throw stones at our neighbour's windows until our own are bricked up.

In another column will be found the commencement of a translation of a critique of Professor Liebig's views and assertions, from the pen of no less considerable a person than Dr. Schleiden, one of the best vegetable anatomists and physiologists whom Germany has produced, and whose intimate acquaintance with the minutest facts of vegetable organisation renders him, perhaps, the most fitting man that could be found to test the soundness of such an author as Liebig, who, although his talent is undoubted as a very able chemist, and a writer of no common order, deals so much in unsubstantiated assumptions on the one hand, and in random assertions on the other, as to render it very desirable that they should be submitted to the rigorous analysis of some critic both able and willing to examine them thoroughly.

We invite the attention of our scientific readers to this document, which is literally translated, with the exception of a few redundancies that we have taken the liberty of pruning away.

THERE is unfortunately a class of low gardeners who abound at all exhibitions, where they render themselves nuisances; and we regret much to add, that they were present in no small numbers at the Horticultural Society's late Show. Of their conduct there are complaints without end, a specimen of which is afforded by the following extract from a letter now before us:—

"It has been a subject of much complaint by the Fellows, and visitors at the Horticultural Shows, that the tents are so beset with persons of the rank of practical gardeners, that it is difficult for the amateur to gain even a cursory view of the objects exhibited. As the nuisance complained of seems to be upon the increase, it appears to me absolutely necessary that some means should be devised, either for excluding persons of this description after a certain hour, or, at any rate, for enforcing the suggestion of the Committee, that visitors should move on without delay after viewing each specimen. The practice at present is this; that in each tent probably twenty or thirty gardeners are minutely examining every specimen of horticulture worth inspection, writing the names of each plant in memorandum books, and discussing, with their companions, their peculiarities; and in the mean while the stream of visitors is absolutely stopped, or compelled to take a passing glance over the heads of those who are thus permitted to remain stationary. I have seen six or eight of these persons repeatedly assembled before a single plant, and taking their notes as leisurely as if they were the only people in the Gardens; and I believe that the general dissatisfaction felt will be fully corroborated by the testimony of the police force employed in preserving the due order of succession through the tents."

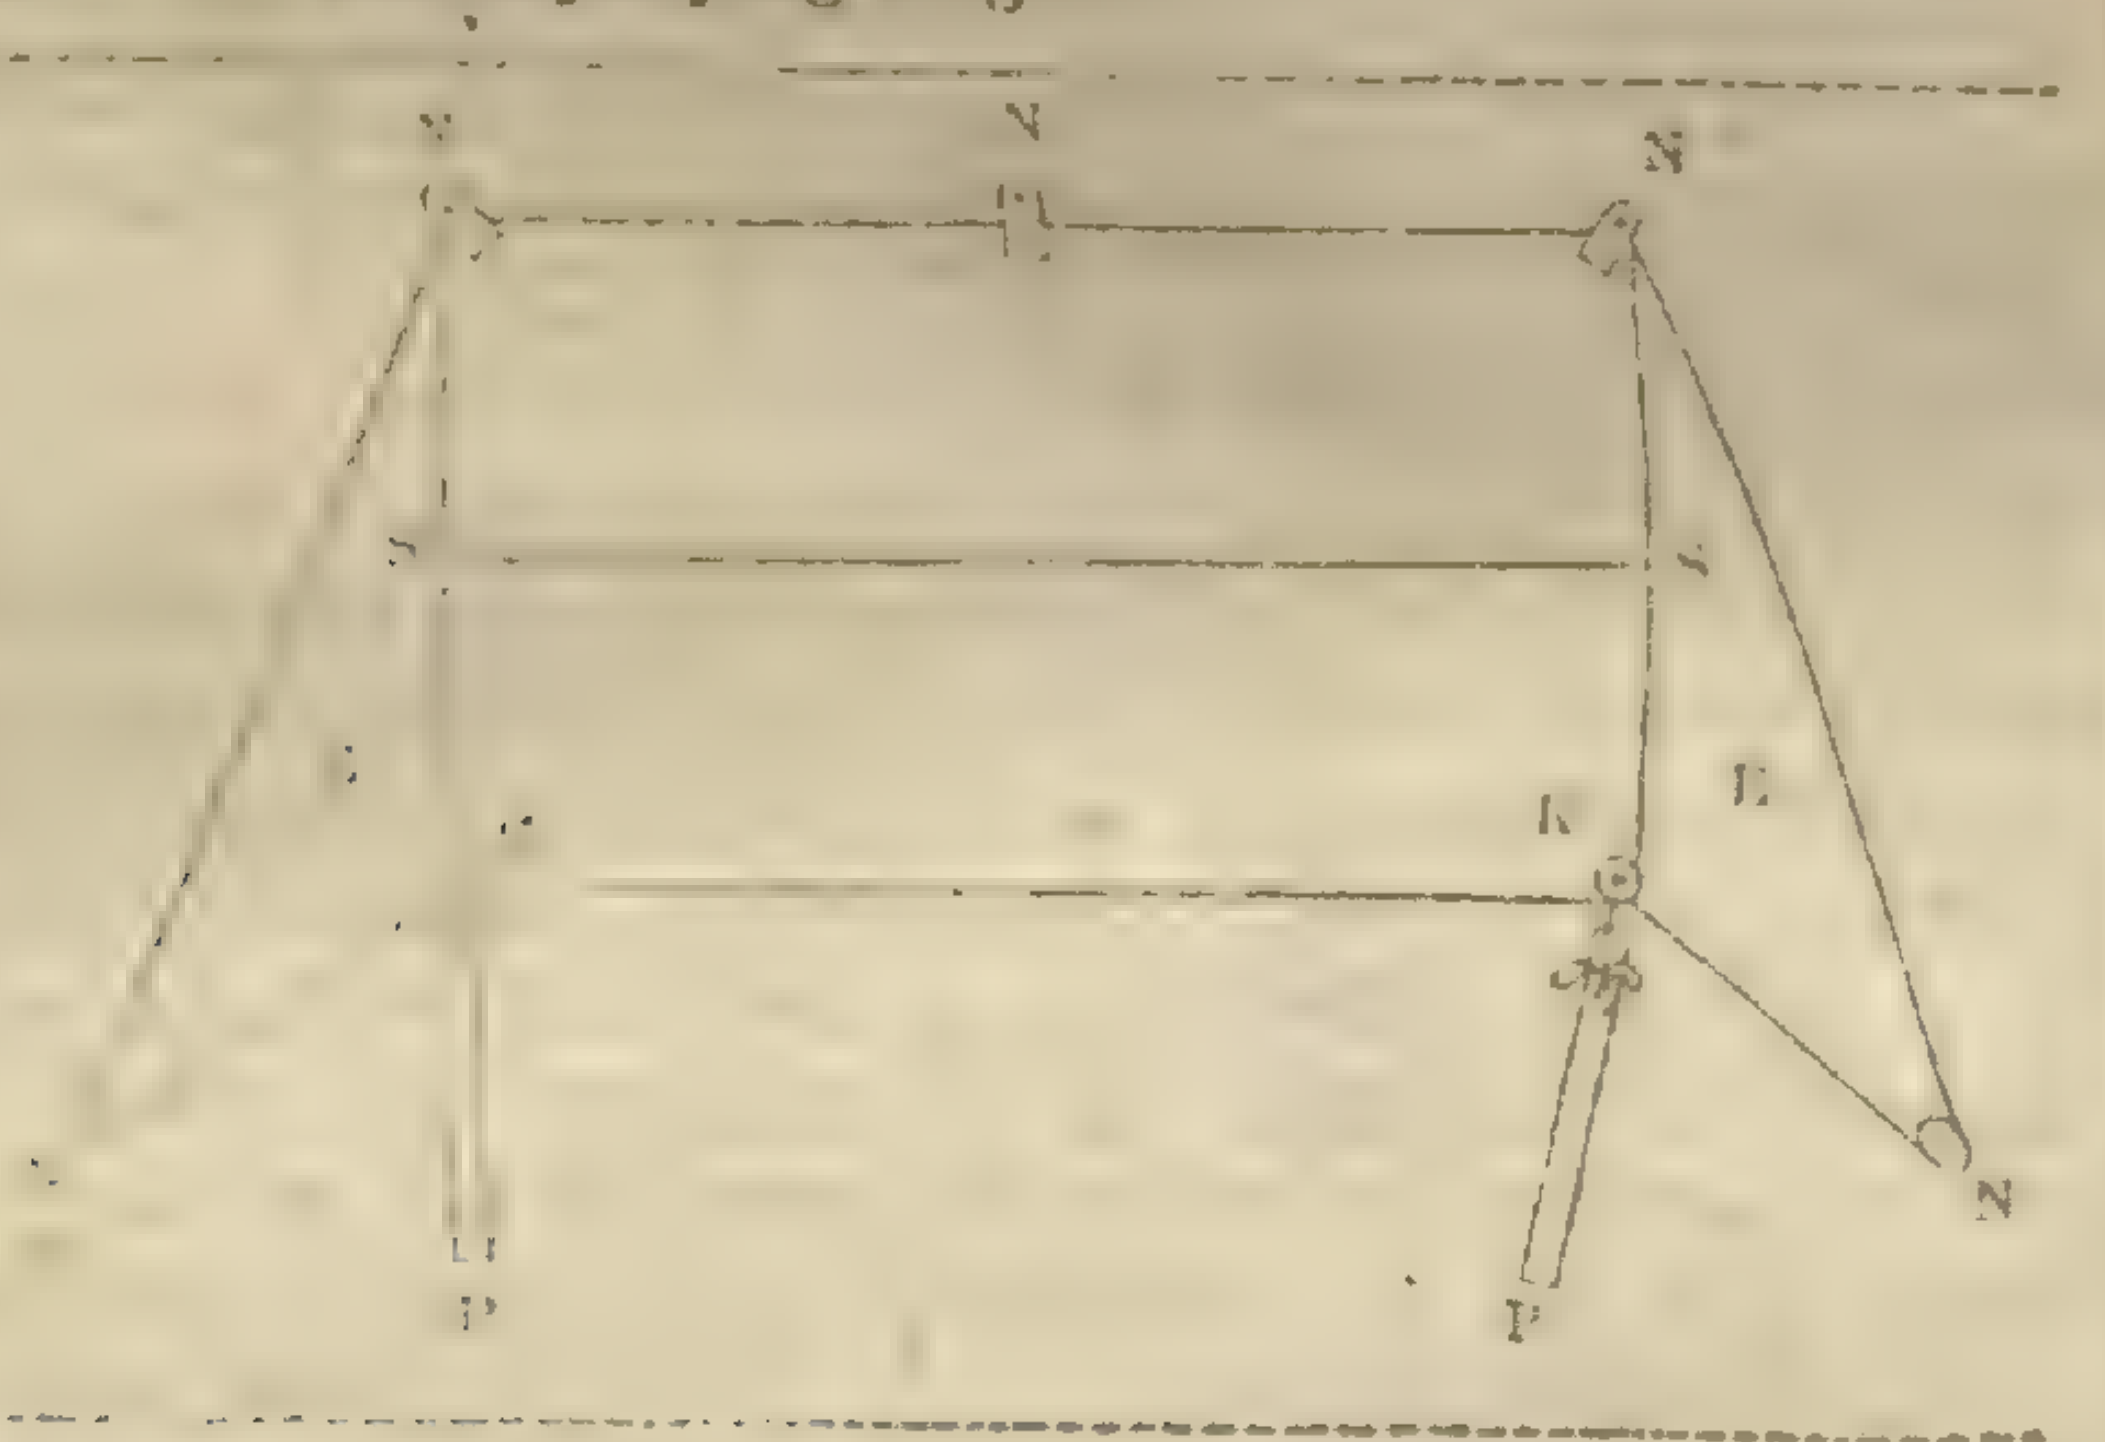
To these statements, which require no corroboration, we may add that, in one case at least, a gardener stationed himself, as we are informed, during the whole afternoon, in the tent of florists' seedlings, before his master's flowers; as if the visitors came to look at himself, and to listen to his *touting*, instead of examining the flowers which were exhibited.

We cannot tell what steps will be taken by the Council of the Horticultural Society to put an end to this conduct, which is intolerable; but it is clear enough that something effectual must be done. The proceedings of such men on former occasions have been the subject of repeated remonstrance with themselves; they have been the cause of really respectable gardeners, of whom no one could complain, being refused passes to admit them in the afternoon, and they will probably have rendered the regulations for the admission of gardeners still more stringent. Should that prove to be the case, respectable men will see whom to blame, for these troublesome people are well known. Perhaps the best course to take would be to publish their names, in which case, their masters would become aware of their misconduct—for remonstrance and advice have failed. No sense of propriety actuates them; and they are evidently ignorant of the common decencies and civilities of society.

A CHEAP REMEDY FOR THE DESTRUCTION OF APHIDES ON WALL TREES.

HAVING observed in recent Numbers of the *Chronicle* articles on the ravages of these destructive insects, I am induced to offer this remedy to your readers, feeling assured that a single trial will satisfy the most scrupulous of the efficacy of the means I propose:—

Burn some gas tar in a large iron ladle, under a cover, as close to the trees as possible; the ladle should be held down low, and in such a manner that the noxious vapour may ascend between the leaves and the wall, taking due care, as a matter of course, not to burn the branches or leaves with the flame. A still calm day will be necessary for this operation, and the ascending vapour should be confined close to the tree as long as it can be retained there, unmixed with atmospheric air. To attain this object more effectually, the subjoined description of a very simple and inexpensive apparatus is suggested, the construction of which will be sufficiently apparent on referring to the accompanying diagram:—



It consists of a movable cover, made of coarse wrappering, such as is used by drapers for packing their goods. The length at the seam S S, should be adapted to the breadth of the trees, say 3 or 4 yards. The depth N K, about 2 yards. The ends E E, may be formed by cutting about 2 yards off the wrapper diagonally. Seven straps of stout leather should be sown to the cover at the five points marked N, and the two marked K; and to the points K, the two wooden props marked P, about 18 inches long each, are to be strongly tied with leather thongs.

The apparatus being now completed, may be readily attached to a wall, so as to cover a tree, by 5 nails driven through the leathern straps at N, and propped away from the wall at K K, by raising the ends of the two props P P, horizontally to the wall. The cover being drawn close, by straining the two lower points N N, in a downward direction, so as to prevent the escape of the smoke, the operator may then effectually destroy the insects, by moving his iron ladle of blazing gas-tar immediately under the cover, backwards and forwards, from K to K, his assistant occasionally keeping up the flame for about five minutes, by supplies of fresh tar with a second ladle. To complete the operation, the trees should afterwards be well syringed; the leaves will then be found quite clean, and free from the insects, and uninjured by any bad effects of the gas-tar, though sulphur burnt in the same manner will entirely destroy the leaves of the trees, as well as the aphides.—*H.*

ON THE TREATMENT OF THE PINK.

THE Pink is deservedly one of the amateur's favourite flowers; the delicious fragrance of its blossoms, exclusive of their beauty, cannot fail to attract his notice, and cause him to pay more than ordinary attention to its cultivation. It is, indeed, one of those plants which cannot be brought to perfection without constant care; and as this is more particularly required at the present period of its growth, a few hints upon the subject may, perhaps, be acceptable.

The first thing to be attended to, will be to thin out the flower stems, in order to throw more strength into those which are left. Where the plants are weak, all the stems should be removed but one; and on a plant of moderate size not more than three should be retained. These, again, should be looked over, and the lateral flower buds removed from them, leaving only the terminal bud and the next but one below it; provided these are perfect in form, all the rest may be pinched off.

Pinks, like almost every other cherished flower, are peculiarly liable, at this stage of their growth, to be attacked by the green fly; and although many persons will have their Pinks partially tied up, yet before securing them further, they should be carefully gone over, and all those heads which are infested should be dipped into a saucer, containing tobacco-water. If this has been procured from the shops, it will be necessary to dilute it with at least an equal quantity of pure water; otherwise its caustic properties may give the buds a sickly appearance.

In tying up the stems of Pinks and other plants of this class, great judgment is required; in fact, delay is better in this instance than too much haste. If tied too high at first, the stems as they lengthen are prevented by the ligature from growing erect, and become crooked or perhaps snap off at the joints. They should, therefore, be looked to every day, where practicable, and if there is the least appearance of any flower stem having become cramped, the tie should immediately be cut loose. The safest way is to secure the bush to the flower stick, to which the stem should be loosely tied, so as to allow it perfect liberty to slide through as it increases in height. These ligatures, when the plants have acquired their full growth, can be easily removed, and the plants tied close without further hazard.

As soon as the pods show signs of bursting and the petals become visible through the divisions of the calyx, a fine piece of bast should be passed transversely round them, about the centre of the pod. This is intended to prevent its bursting unequally on one side, but it must not be fixed too high nor tied too tightly for fear of increasing, instead of remedying the defect. These ties should also be daily attended to.

When the forwardest blooms begin to expand, hoops should be fixed across the bed to support mats, or any other lighter material, that will serve either to protect the flowers from the rain or from the rays of the sun. They need not, however, be shaded earlier than nine o'clock in the morning or later than five or six in the evening; but if there is the least appearance of a wet night, they had better be covered before leaving them.

Should the season be dry, they will require regular watering between the rows; pond water, where procurable, is always to be preferred. A little clay or stiff loam placed in the form of a margin round the edge of the bed, would serve as a basin, and prevent the water from escaping into the path or alley. A short article on their propagation will be given hereafter.—*T. R.*

AMATEUR'S GARDEN.—No. XXV.

IN again directing the attention of the amateur to the summer pruning of wall trees, it may be proper to press upon his attention the importance of going over them frequently, as I before recommended, instead of leaving the operation undone until a certain time, and then doing all that is requisite at once. It ought always to be recollected, that trees are organised beings, and that a severe check, when the sap is in full motion, is much more likely to be injurious than beneficial. In some sheltered situations, where the sun shines with great power, but where there is not a free circulation of air, Vines grow with great luxuriance, and are apt to get "drawn" and weakly; the branches then are too much shaded by the numerous leaves which are thus formed, and the young wood is not properly ripened for another year. When this is the case, it is particularly necessary to go over them frequently, removing the laterals and useless wood, and so exposing the young branches and stems to the influence of sun and air. In such situations, the wood should be laid in thin, at the period of winter pruning, and the branches encouraged to extend themselves as far as possible; they are then much more likely to bear well. When the principles of summer pruning are fully understood by the amateur, he may apply them more or less to all the trees in his garden, with the most beneficial results; even Gooseberry bushes in many instances might be greatly benefited by such attention. The proper way to prune them, is first to remove all the suckers which spring from the root, then the strong "water" shoots, and any others which seem to be unnecessary; taking care neither to over-prune, nor to remove too many branches at one time, by which the health of the bush may be injured. By attending to this for a season or two, the bush in many cases will be thrown into a heavy fruit-bearing state, and will require little pruning either in summer or in winter. This is a beautiful illustration of the way in which nature, in many instances, makes herself subservient to the purposes of man.

Rose stocks, which were planted in the Spring for budding upon, must now be looked over, and all the shoots removed, except two or three at the top, into which the buds are to be inserted when the budding season arrives. Do not allow Rhododendrons and plants of that kind to produce seeds, but remove with the hand all the young seed-vessels, as soon as the flowers fade and become unsightly. If they have not grown into thick masses, they will be suffering for want of rain, and ought to be liberally watered. Evergreens and fruit trees, which were transplanted in the Spring, are now suffering much from the same cause; and if watered at all, it ought to be done in the way which was formerly recommended. If a little rotten dung, or litter of any kind, is spread over the surface of the ground after the watering, it will prevent the ground from drying so soon, and will be beneficial to the trees.

As soon as the ground is moistened with rain, Annuals may be sown, for decorating the garden with their gay flowers in Autumn. They may also be sown now in pots, either for planting out, or for flowering in the balcony or the greenhouse. Those who have been growing Balsams in a pit or frame, may now remove them to the greenhouse or other sheltered situation, where they will flower and look pretty for some time to come.—*R. F.*

HOME CORRESPONDENCE.

The Fountain in St. James's-park.—In the leading article of your last Number you have called public attention to a thing placed near the head of the lake in St. James's-park, and with great justice you express a hope that the proper authorities will reconsider the fitness of such an ornament for that locality. I should let the matter rest here, were it not that I feel convinced that you have not assigned the true principle, which renders not only the fountain in question, but any decoration of that description, incongruous and wholly out of character with the truly beautiful specimen of landscape gardening exhibited in St. James's-park. Ornamental gardening may be divided into two distinct kinds—the one of Italian origin, the other peculiarly English. The first possesses beauties of a very high order—straight walks, whose breadth and length have an imposing and majestic effect; terraces above terraces, communicating with each other by ample flights of steps; the whole enriched with gorgeous vases, statues, and groups; and, above all, with jets-d'eau springing from sculptured fountains, whose form and size requires the practised eye of the classic artist to be in just keeping with surrounding objects. With these, the symmetrical parterre glowing with Flora's gaudy colours—long lines, in due season, of Orange, Myrtle, and Oleander trees, in their gay boxes—all form together a splendid picture, in which the hand of the artist is everywhere to be recognised. In English gardening, the reverse of all this forms the true charm. Here, the effort must be to get so near to nature, that we almost forget that it is nevertheless a creation of art. How beautifully is this shown in St.-James's-park! The noble trees are so happily placed, that chance alone appears to have scattered them over the verdant lawn. The lake, whose sinuosities are carefully managed to avoid exaggeration, sleeps tranquilly among the masses of shrubs, which here and there shade its waters, and conceal its extent; while the occasional flight of the aquatic birds, or their merry gambols on the surface of the water, alone disturb the calm repose of the scene. What a taste, then, must he have, who can admire a piece of sculpture of any sort throwing upwards a thin stream of water! reversing the laws of gravity, and thus forcing on the imagination the artificial character of the thing, and dispelling at once every particle of illusion, which was the great object and aim of him who originally planned this exquisite pattern of a truly English garden. I hope sincerely that your notice of this monstrosity may have the desired effect, and that neither man nor fowl be longer affrighted by this pale spectre of the waters. If not considered irrelevant to your publication, I should like on some future occasion to make some remarks on the taste displayed by certain workmen in Roman cement, &c., in the fashion of their garden vases and ornaments. I should begin with the fountain in question—the very climax of vicious taste and absurdity. —*Ortolano.*—[Pray oblige us with them.]

Proposed Improvements in exhibiting Roses, and new Prizes hinted.—After returning from a visit to the magnificent show of the Horticultural Society, I began to think of what I had seen; and one or two things occurred to me, which I beg to suggest to you. The first is, that every plant shown singly, whether cut flower or not, should have a name written upon it intelligibly. The second is much more difficult to accomplish; it is to reform altogether the mode of showing Roses. By gathering them as at present done, and tying them up in bunches (to say nothing of the want of names), the whole character of the species or variety is lost. I think it very right that amateurs and others, who have been at the trouble of cultivating large quantities of the best Roses, either for pleasure or profit, should be allowed and invited to show the results of their skill or the extent of their stock; but I do not think that Roses so shown ought to be entitled to prizes. I venture to suggest that prizes should be reserved for flowers shown singly, like Carnations, Pinks, and Heartseases, or for Roses in branches, with all their buds and leaves about them; no two branches being allowed to be fastened together. By this means the real merit and character of each sort will be exhibited. Who, for instance, shall judge of the beauty or applicability to a particular border of a Noisette Rose, from a single blossom, or a bunch of blossoms, tied up like so many violets? The same holds in a great extent with all the Roses, as much of their beauty depends on the way in which they bear their buds. Many of the Pillar Roses are exceedingly beautiful on the branch; but each blossom is quite insignificant; and so forth. It would be easy to construct a stand for such single Roses. A board having a few upright pegs to which the several specimens might be tied, would answer the purpose. I would suggest that each branch or flower should have a little damp moss tied round it, and that the upright sticks or pegs should be painted of particular colours belonging to different gardeners; so that as the horses of the Marquis of Westminster, the Duke of Bedford, Lord Chesterfield, &c. are distinguished on the turf by the colours of their jockies, the various collections of Messrs. Rivers, Paul, Lane, &c., should be distinguished by red, yellow, green, and other colours; and that no infringement be allowed at the exhibitions of the Garden at Chiswick. The amateur collections might also be distinguished by their colours, of which white should always form a part. Mrs. Marryatt, for instance, might have white and blue, Mrs. Lawrence white and yellow, &c. I think, too, that well grown and well covered Rose trees, or bushes, in pots, would be very legitimate objects for a prize. We see what has been done for the Pelargonium; and why might not as much be done for the still more beautiful tribe of Roses. Example only is wanted; patronage will follow. I confess I think the Horticultural Society stands so high, and has such means in its power, that it could set the example, and could lay down rules and regulations upon this interesting subject which would be readily adopted, and afford quite a new feature in its next approaching exhibition. Indeed, I think some novelty must be soon introduced for, beautiful as they are, Pelargoniums are in my mind growing stale; we do not like *toujours perdrix*.—*George Fancier.*

The Qualities of a Good Rose.—Mr. Shears, of the Floricultural Society of London, on the 21st inst. gives a five guinea silver cup for 36 Roses, to be exhibited in single blooms. This is the first prize offered for Roses by the Society, and of course they will be judged by the same rules as "florists' flowers," *i. e.* by perfection of form. A few words are, therefore, necessary as to what qualities constitute a perfect Rose; and these may probably be a guide to the growers, as to what they should endeavour to exhibit. For perfection of shape, the outer row of petals should be a little incurved, so as to form a shallow cup. If the summits of the pistils (as is often the case in fine Roses) are inclined to be monstrous, so as to form themselves into an incipient flower-bud in the centre of the flower, such a Rose should disqualify a stand. Uniformity of size should by all means be attended to; and diversity of colours also should be a leading feature, so as to give as many tints as possible in the 36 Roses selected for competition. If these few rules are not adhered to, much trouble will be given to the judges; for one grower may exhibit 36 very double and beautiful Roses, but some of them with reflexed outer petals; another may perhaps think that size alone will carry the day, and accordingly show all large Roses, without reference to perfection in shape, and feel dissatisfied at the result. Let all, therefore, endeavour to exhibit those only that are most perfect, and with as much variety in colours as possible: the judges will then find their task comparatively easy.—*T. Rivers, Sawbridgeworth.*

Malformation of Roses.—I have a large bed of Roses in my garden, which was well manured with stable dung last autumn; and I find that, in many instances, the green leaves are now appearing through the flower-bud. This appears to depend neither on soil nor on the particular sort of rose. For instance, in the bed that was well manured I have Russelliana, Hybrid China, Noisette, Alba, and various others, with a large blotch of green leaves showing above the level of the flower; and in another bed, in which there was comparatively little manure (having been a Carnation bed, composed of loam and sand), the same thing has occurred in flowers of St. Ursula and the Hybrid China; whilst in another bed, of precisely the same compost as the one first mentioned, the flowers of Polard and Hybrid China have opened without the slightest imperfection. I at first imagined that it might be owing to a superabundance of manure; but when I saw other plants, in the same bed and under the same treatment, blooming well, and St. Ursula showing the defect, although planted in a bed where there was comparatively little manure, I was led at once to discard that opinion. I should feel obliged if any of your correspondents would solve the difficulty, and enable me to bloom *all* my plants without the eyesore I have mentioned. I would also ask whether the present is a good season for Roses, and whether, owing to the long continuance of dry weather, they are not blooming small? This is the fact with me, notwithstanding the waterings they have had.—*Amateur.*—[This is by no means a good Rose season. We know of no remedy for the formation of leaves in the centre of Roses; perhaps some of our readers do. We should suppose the richness of the soil, in some respect or other, to be the cause.]

Soil for Rhododendrons.—A correspondent has expressed a wish to have an analysis of the ashes of the Rhododendron. He will find it in "De Saussure's Recherches sur la Vegetation." The work being difficult to procure, perhaps the following extract may be acceptable:—"Ashes from the leaves of the Rhododendron ferrugineum, grown on a calcareous soil—

Salts soluble in water	38.63
Earthy phosphates	14
Earthy carbonates	43.25
Silica	0.75
Alumina	0.12
Oxide of iron and manganese	3.25

The same grown on a silicious soil—

Salts soluble in water	52.54
Earthy phosphates	16.75
Earthy carbonates	16.75
Silica	2
Alumina	0.12
Oxides of iron and manganese	5.75"

He found in the branches 11 per cent. of the oxides of iron and manganese, and in the soil 18 per cent. It is very probable that to a deficiency of these substances in some soils may be attributed the unhealthy appearance of Rhododendrons. As phosphate of iron is a constant element in bog earth, it is not improbable that this salt may prove beneficial. I applied some, about a month ago, to some Rhododendron plants; but the continued dry weather has prevented it from taking any effect. Phosphate of iron not being an article of commerce, perhaps the method of preparing it may prove acceptable. Make a clear solution of sulphate of iron, and to this add solution of phosphate of soda until it no longer causes a precipitate; allow it to settle, and pour away the liquid —repeat this until the water becomes tasteless. The phosphate may now be dried, or, what is better, applied to the plants in its gelatinous state.—*J. B. L.*

Bulbs.—In looking over a late number (April 30th, 1842), of the *Gardeners' Chronicle*, I find among the notices of new plants, an extract from Mr. Herbert's work on the Amaryllidaceous order. This gentleman, it appears, has lost many of his bulbs from having exposed them above the surface of the soil; the loss, he says, being occasioned by the bulbs imbibing moisture from the atmosphere while they were in an inactive state. Though bulbs may be injured, if not killed, by being exposed to the atmosphere while they are in an inactive state, I think the injury results not from the absorption, but from the exhalation of moisture by the bulb while at rest. I am led to this opinion by supposing that the bulb, at the time of the decay of the leaves and roots, to be as full of moisture as it is possible for it to be. At this time it is firm and plump, but after a few months' exposure it becomes soft and spongy, with a considerable diminution in its weight; whence I infer that moisture has been lost. Several of the external scales which, at the time of the ripening of the bulb, were perhaps as full of sap and as healthy as the internal ones, will, after a few months' exposure to the atmosphere, be found quite dry, and others partially so. I have never made any direct experiments, by which I could support my opinion; but from the above facts, I think it is probable that injury results rather from exhalation than from the absorption of moisture by the bulb. It is natural, perhaps, for some of the scales to perish yearly: I have dug up bulbs of Hæmanthus which were much larger than my head, but one half of their substance was decayed scales, and this too at the Cape, their native country. As regards burying the bulb beneath the surface of the soil, if nature may be followed in this respect, it would seem to be the true system. No country produces a greater variety, or a greater quantity of bulbs, than the Cape; whilst there I never remember to have seen bulbs of any kind growing on the surface of the soil, they being generally from 2 to 18 inches in depth. I have found bulbs of a species of Hæmanthus upwards of 3 feet below the surface; but this might have been occasioned by the drifting of the sand over them: but the flowers were large, and the bulbs apparently healthy. It is always interesting, and sometimes necessary, to trace effects to causes, in order to find a remedy for an injury. Whatever may be the cause by which bulbs are injured, whether by absorption, or by exhalation of moisture, or by anything else, I shall leave, at least for the present, to wiser heads than mine to determine. I merely offer an opinion of my own, as a preliminary to a simple expedient, by which bulbs may be partially, if not wholly, preserved from injury, whilst they are in an inactive state. Take as much common brown paper as you are likely to require, and laying a sheet open upon a table, smear it all over with oil, putting on as much as it will absorb, then hang it on a line to dry. When the bulbs have completed their growth, and the soil in the pots is quite dry, cover the surface of the soil with dry silver sand, heaping it up as high as possible round the bulb, if it be above the surface of the soil. Then cut a piece of this oiled paper somewhat larger than the top of the pot, and tie it on round the rim of it, exactly in the same way that a housewife ties pieces of bladder over her pots of preserves. The gardener sometimes keeps his bulbs in the hothouse the whole year, and may be troubled with the water dripping on them, to their serious injury; this may be prevented by using the oiled paper covers. It is sometimes inconvenient to bury the long bulbs of Brunsvigia, and of other genera, without putting the bulb quite down to the bottom of the pot—a method always to be avoided. If large pots are used, they are unsightly; the better way, therefore, with these large bulbs, would be, to bury them at a convenient depth, and at the season of rest to cover them with the sand and the oiled paper, in the way that I recommend. Shortly before the bulbs begin to grow, the covers should be removed, and preserved for another year.—*Observator.*

Purple Laburnum.—In your *Chronicle* for 1841, pp. 325, 365, I have given an account of a large shrub, called the purple variety of Cytisus Laburnum, which, from among its crowded racemes of the usual dingy colour, produced some shoots of the common yellow Laburnum, and others of the Cytisus purpúreus. Of these parental shoots (if I may so call them), which have increased much in size as well as number, there are now about twice as many as appeared last year, and in two instances there is now a perfect shoot of each parent on the same branch. A further approach towards the extinction of its hybrid character, appears, moreover, to have been effected since last year, and in some of the branches, which otherwise retain their hybrid appearance, a raceme occasionally contains a flower with one or both of the petals of the keel, or half of the standard, or of one of the wings, of a bright yellow colour. In the raceme of another branch, I have also observed a flower with the standard of a bright purple, but I believe that the variegation of any flower with yellow, and of another with purple, never occurs on the same raceme. Another circumstance, worthy of remark, is that these yellow parts of a flower are always proportionally much larger than the other parts which retain the dingy hue; and *per contra*, a purple standard which I examined, was smaller and resembled C. purpúreus in size as well as colour. In this way a variegated wing, which is now before me, presents a very distorted appearance on one side of the middle nerve, which is yellow, and has expanded to twice the size of the other side, where the dingy colour is retained.—*L. W. Dillwyn, Sketey Hall.*

Hellebore Powder and Gooseberries.—I entertain a different opinion to that expressed by your correspondent at p. 349, respecting the effects of Hellebore-powder on caterpillars. The Gooseberries and Currants in my garden were perfectly overrun by them, and I adopted various methods for their destruction, but without effect. At last I purchased a parcel of the powder recommended in the *Chronicle*; and having mixed it well with soapsuds, I applied it to the bushes with a watering-pan, under strong sunshine. My bushes are now perfectly clear of these destructive insects, since they fell in thousands six hours after the aforesaid application. If "Surreyensis" had mixed the powder with soap-suds, it would perhaps have taken more effect than when applied in a dry state. I should be obliged if any of your correspondents could give me information how to destroy the grub that infests my Onion-beds.—*A. Mitchell, gardener, Pitcaple Castle.*

Experiments with Gas-water upon Spinach.—Having tried several experiments upon vegetables with Ammoniacal liquor this season, the result of which may be worth knowing, I send you an account of its effects upon Winter Spinach. In the month of March I selected the worst row of Spinach that I could find, from which I chose eight plants equal in size and appearance. The first plant was watered with the liquor as it came from the gas-work; the second had one part of water added to the same quantity with which the first was watered; the third had two parts of water; the fourth had three parts, and so on to the eighth plant, which had seven parts of water to one part of Ammoniacal liquor. The earth was stirred about the roots of the plants before the water was applied to them. In a few days the Spinach that had been watered changed to a darker green than that which had not; the heart-leaves of the first plant curled up and never expanded freely, the mixture being probably too strong for it. The plant, however, was not killed, as the other leaves after a time grew pretty well. Although Nos. 2 and 3 did not curl in their heart-leaves, still they did not grow away so freely as the remaining five; the progress of these was wonderful, considering how weak and sickly they appeared before the liquor was applied to them. Some of their leaves measured 10½ inches in length (exclusive of the foot-stalk), and 8 inches in breadth, being also thick and succulent; while the texture of the leaves of the unwatered plants in the same row was thin, and their colour of a light green. I may also state that the greater part of the latter was nearly in flower before the plants watered with the Ammonia were beginning to run at all; so that the Spinach crop may, if required, be continued good until the 1st of June. This experiment will show that gardeners need not be particular about manuring ground for Winter Spinach; in fact, I have sometimes found that where it has been sown in rich soil, the leaves became succulent, and were often killed by the frost; while that sown on poor soil was not at all injured. If watered once or twice with liquid manure in the spring, I am convinced that the leaves will be both earlier and better than from the manner in which Spinach is generally grown. I think gardeners will soon be enabled to feed their vegetables, and render them fit for use, whenever they think proper, with as much certainty as a cottager can fatten his pigs, or a grazier his cattle.—*P. Mackenzie.*

Pruning Forest Trees.—I am always pleased to see the subject of pruning holding a place in your journal. In a late number your plan is distinctly explained. Were thinning properly attended to, it would do much to accelerate the growth of trees; but in most cases it is neglected. I am of opinion, however, that in addition to thinning, pruning is advantageous in promoting the size and value of timber. Stopping, or breaking off the points of the branches, fulfils, to a certain extent, the purpose of pruning, although I do not think it can so fully accomplish the benefit which pruning will effect. You remark, "it is the foliage which forms the stomach of the plant, therefore, to deprive a plant of its leaves is like depriving an animal of its stomach." Admitting this truth, then, the great object of the forester ought to be to increase the digesting powers of the plant, and thereby administer to its health and vigour. Now we maintain that the shortening of the branches multiplies the quantity of leaves, and, at the same time, gives greater activity to the sap. In the article referred to, it is said, "What is pruning but the removal of leaves? To cut off a naked branch is not, indeed, to remove a leaf; but it is to remove that part from which many leaves would have sprung had it been permitted to remain." I think this notion is one of the chief mistakes among those who are opposed to shortening, or what I call "Concentrate Pruning." A large branch surely puts forth more leaves than a small one, but by shortening, the number of twigs or branches are multiplied almost indefinitely, so that the quantity of foliage in the aggregate, is far greater on the pruned than on the unpruned plant; while the foliage is more healthful and efficient; presenting leaves as broad as two or three of those on the branches which are of an extravagant length. The principle of stopping and shortening seems to imply a similar design in those who practise the different methods; namely, to keep the branches within due bounds. The difference is, the person who stops them takes no more from the large than from the small branch; whereas the pruner curtails each tier of branches to a uniform length; the tiers extending in breadth as they descend, in the form of a cone. This, at least, is my method. I consider it to be beyond the bounds of human ingenuity to act successfully in this case without some regular system. He who will have branches of various lengths and sizes, without any assignable reasons, is unnaturally capricious. Nature, in fast-growing trees, such as the Larch, admits of no such irregularity; and it is to promote rapid growth that we prune as we do. I account for the quick growth consequent on my system of pruning thus: the sap which ascends from the roots, mingling with that absorbed by the leaves, returns down the vessels of the bark, and in its course deposits cambium, which forms the annual rings of wood. It is obvious that this cambium, having less superficies to cover than when the branches are extended at large, there is a more abundant quantity for every part; and as little is required for the branches, which are shortened and slender, the trunk receives the main supply. The superior health and breadth of the leaves largely augment the velocity and power of the sap, which produces a wonderful advancement in the tree. The method is very simple: I shorten the shoot next the top to one half the length of the leader, and allow the lower tier to extend farther than the one above it, till I reach the undermost, which is, of course, the broadest. When the tree is about 18 feet high, and 15 inches in circumference, I cut off the lowest tier close to the stem, and continue yearly to cut off a tier (regularly) upwards. I have by this means raised hard wood to as great a height, within the same time, as Larch; and have not discovered, either by observation or otherwise, that trees were ever raised so rapidly to the same altitude, as those trained on the above plan. They sometimes grew 10 feet in the course of three years.—*Gavin Cree, Biggar.*

Bees.—Although I very much admire your answer to "M. H. G.," in the *Chronicle* of the 11th inst., I am sure you will excuse my offering a few additional words. The conduct of the bee-scouts, adverted to by your correspondent, is one of frequent occurrence (*vide* "Honey-bee," pp. 170 and 171); and, considering that he has not only an apiary of his own, but is in the immediate neighbourhood of several families of bees, out of the control of man, I think him fully justified in allowing an untenanted hive to occupy a place in his garden. None of his neighbours ought to feel aggrieved by so prudential a measure —a measure which they have the same opportunity of adopting, and thereby placing themselves upon an equality with him. The conduct of the old woman was extremely absurd. Her bees, owing probably to neglect, were in danger of famine, and therefore availed themselves of the hospitality of her neighbour's bees; to whom they may be reasonably supposed to owe their preservation, and, in my opinion, they owed them also allegiance. Besides, bees cannot be separated from a family to which they have united themselves, like mingled sheep in a field. There are no means of discriminating between the original possessors of the hive and those which they have received into their family; and if there were, who would undertake to accomplish the division? The conduct of both the squabbling neighbours is alike unjustifiable, and I conceive it to be alike punishable.—*Edwd. Bevan, Llanferry.*

Remedy for the Wireworm.—In your paper of June 4th, I observe that F. Chase, of Luton, inquires for a remedy against the wireworm for his Dahlias. In the "Farmers' Almanac" for this year, under the head of Manures, it gives Rape Dust; and at the end of the article it says that this is noxious to the wireworm and other predatory vermin. I, therefore, recommend your correspondents to try it in their gardens.—*T. W.* [We have no faith in the above recipe.]

Alteration of the Meaning of Words by Acts of Parliament.—A curious instance of this has arisen from the Commutation Act, which makes tithe payable on growing produce, and due at Christmas or Lady-day, for one-fourth or one-half of the amount assessed in the standing crops. A Dorsetshire clergyman, whose age exceeded 80 years, was in the habit of inserting in the receipts for his composition tithe, that the payment was due at Lady-day. This payment could only be for tithe on the previous harvest, but under the Commutation Act the words due at Lady-day have a different meaning, of which one farmer endeavoured to avail himself, and avoid payment of the commutation tithe or rent charge, for the six months from Michaelmas to Lady-day. On tendering his last payment for composition tithe, he refused to accept a receipt, which, to prevent misunderstanding, expressed that it was for tithe of the previous harvest, and he succeeded in obtaining from the unwary rector a receipt in the old form, to which the Commutation Act had given a new meaning; but having made use of a wrong stamp, it will not avail him in evading payment of the rent-charge on the growing crops. However, the agent employed to collect the tithe considers that he has a *primâ facie* case for resisting payment, on the ground of the wording of the previous receipts. He cannot comprehend that the meaning of the words, "due at Lady-day," has been altered by the Commutation Act, and includes tithe or growing crops.—*S. S.*

New Method of writing upon Wooden Labels.—Tallies for common use are generally made of American Fir, part of them being rubbed over with white lead, and the name being written thereon with a pencil; but this pencil mark is often worn off by the weather sooner than the gardener would wish. I have tried the following method, and find it answer much better. I first paint the label black, and let it dry thoroughly; and when it is required for use I rub some white paint over the black, and instead of writing with a pencil, use a fine-pointed stick, by which means the black colour will appear, and it will be found more durable than the pencil-mark.—*P. Mackenzie.*

Clématis azúrea grandiflora.—It has been asserted that this most beautiful plant will not stand our winters in the open air; but I wish to say that I know a plant in the neighbourhood of London, which was planted out in the beginning of May, 1841, where it has stood during the whole of the last winter unprotected, or sheltered in the slightest degree; and it is now beautifully in flower. This makes a most valuable addition to our other hardy climbers, and will doubtless soon find its way into the garden of every amateur.—*D. W., Bayswater.*—[Our correspondent is mistaken in supposing this fine Clematis to be thought tender. It is known to be perfectly hardy.]

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Garden Exhibition, June 11.—Notwithstanding the oppressive heat of the atmosphere, and the continued drought which had been experienced for some time previously, robbing the lawns alike of their verdant tint and their luxurious coolness, there was an immense concourse of spectators to this, the most fashionable of the summer shows. And although the exhibition was not, on the whole, so striking and gorgeous as that of the 14th. ult., owing to the absence of those rich and inimitable masses of Azaleas which were then present, it was, considered in itself, extremely excellent, and in some of its features, surpassing that just referred to. At the May fête, we were called to notice the dearth, as well as comparative inferiority, of the Heaths. Now they may, beyond doubt, be assigned the chief place in our record. The beauty and vigour of the specimens, with the abundant manner in which they were blooming, called forth well-merited commendations. Of praise, too much can hardly be given; while many, who find it hard to keep their Heaths healthy, after they have grown above nine inches or a foot in height, may wonder how such perfect plants have been obtained. It will not perhaps be foreign to the object of this report to insert a hint or two concerning the practice of the most successful cultivators.

The soil employed is not reduced to a fine state, or sifted, but is just roughly separated, and all the fibre retained. Indeed that kind of Heath-mould which contains a large quantity of fibre is preferred. By these means, that close coalescence and hardening of the earth which oppose the percolation of water, and are thus instrumental in killing the majority of Heaths that are annually lost, can be nearly obviated; and, to realise more thoroughly the same end, small fragments of porous, broken stone are mixed with the soil. The use of such auxiliaries is to render the earth constantly open, while they also serve themselves as reservoirs of moisture, during periods of temporary drought. Through their introduction, likewise, the culturist is enabled to afford a larger pot than he otherwise would, thus allowing them an approximation, at least, to the benefits of being planted in an unlimited bed or border. The next great point is to make them bushy, and induce their branches to cover the whole surface of the pot, or even to hang down over its sides; and this not merely for appearance' sake, but in order to shelter the soil and roots from the scorching rays of the sun. With most species, an early and oft-repeated reduction of the shoots is the method by which bushiness is attained; though there are some kinds that will not bear this, or will endure but little of it. For the last-named, it is necessary that the branches be spread out, and fastened to a wire frame, or to stakes, from the first; directing the lowermost ones, originally, into a horizontal or half-pendent position. It is of the greatest moment, that both the stopping and training should be begun while the plant is very young and small, and be followed up as occasion may arise. Again, Heaths in pots suffer much from aridity in summer, and this is materially aggravated by their being placed on an elevated stage in a light greenhouse. Hence, the best growers transfer them to pits or frames, which have apertures beneath for the admission of air from below, and in which a moist atmosphere is more easily preserved. From these frames the lights are often removed altogether in the day, and a canvas screen substituted for them. Shade and a freer current of air are thus produced. Sometimes, as was the case with one of the collections shown on Saturday last, the pot containing each specimen is put within another and larger pot, and the space between filled with sand, moss, or light earth, which, being kept always moist, has a cooling and invigorating effect on the roots of the plant. Where frames are made use of, however, so troublesome a process is wholly needless. Besides the advantages of frames already mentioned, they tend, with little short of certainty, to prevent the occurrence of mildew —that strange and often unavoidable pest to cultivators, who have nothing but greenhouses. Facts lead to a belief, if not to the positive assurance, that mildew on Heaths is caused by a close and dry air; consequently, the more humid atmosphere of frames may be the means of preventing it. At any rate, it scarcely ever appears on plants grown in frames.

What has been said, will indicate their general treatment, the results of which were witnessed on Saturday last. The reader will assuredly regard our observations with more interest, than could be excited by a bare mention of the particular species exhibited—which, however, we shall not entirely withhold. By far the most remarkable Heath present was a plant of E. depressa, from Mr. Veitch, of Exeter. It was about 3 ft. in height, with a stem 9 inches or a foot long, and almost 2 inches thick—while the head, at least 2 ft. across, was a compact mass of luxuriant verdure and fine yellow flowers; and the branches depended around the stem so as nearly to conceal it. It was, in fact, a beautiful miniature tree, without any of the stuntedness or imperfection which usually attach to such objects. The same species was exhibited, from nine to eighteen inches high, by Mr. Falconer, gardener to A. Palmer, Esq., of Cheam; by Mr. Barnes, gr. to G. W. Norman, Esq., Bromley; and by W. H. Storey, Esq., of Isleworth. All the plants were singularly dense, of a peculiarly deep and rich green hue, and the flowers large, as well as numerous. E. élegans, a species admirably suited for growing in a dwarf and compact manner, yet frequently to be seen in a ragged and starved condition, was shown, flourishing with unparalleled exuberance, by Mr. Jackson, of Kingston, whose specimen was 18 in. high, and a foot broad. The shoots and blossoms were wonderfully close and large. Mr. Barnes, above spoken of, had, moreover, a plant of E. élegans, only 6 in. in height, and quite a picture of healthy beauty. The handsome E. tricolor, though appearing in several groups, was brought, as a single specimen, by Mr. Salter, gr. to J. Yelles, Esq., of Bath, by whom it had been cultivated to an amazing degree of perfection. Its height was about 3 ft., and its breadth fully as much, the branches being actually more profuse at the bottom than the top, and curving down very gracefully and abundantly 3 or 4 in. below the edge of the pot. When it is stated that this large mass was composed of branches, as closely arranged as they could well grow, and that every branch was terminated by a fine cluster of long, conspicuous, but delicately painted three-coloured blossoms, a tolerable notion will be gained of its loveliness. E. splendens, with its copious bunches of large, inflated scarlet flowers, was sent by many individuals; yet none, we think, had it so fine as Mr. Barnes and W. H. Storey, Esq. An extremely good plant of E. odorata alba, which is a variety alike meritorious for the elegant disposition and bell-like figure of its pretty, white, pendulous flowers, and their sweet fragrance, hardly inferior to that of the Lily of the valley, was contributed by Mr. Green, gr. to Sir E. Antrobus, Bart., Cheam; the specimen—a foot high—bore an uncommon quantity of flower-heads, the number of blossoms on each of which was equally noticeable. E. denticulata, a neat and graceful species, with flowers somewhat resembling those of an Arbutus, but pale yellow, and tipped with a nearly black hue, appeared in a fine state from Mr. Green, Mr. Barnes, and others. Mr. Clarke, gr. to M. J. Smith, Esq., Shirley Park, produced a magnificent E. ventricosa cárnea, which was 3 ft. high, and the same in breadth. The charming flush of its flesh-coloured blossoms was not more delightful than the liberality with which they were produced, and the size of their closely packed heads. The old, but always pleasing, E. Bowieana, was never more appropriately grown than by Mr. Jackson, whose plant was 4 ft. high, yet displaying a bushiness and disposition to ramify which is uncommon in the species, and having enormous spikes of its pure white, partially pellucid flowers. E. propendens, one of the most interesting of the tribe, was shown by Mr. Barnes. It was 2 ft. or more in height, and well-bloomed, but appearing as if it had blossomed too freely in the preceding season. Its delicate pinkish-purple, bell-shaped flowers are highly beautiful, and their drooping character is in unison with its slender foliage. The E. Bergiana, brought by Mr. Jackson, had reached the height of 2 ft., and was quite covered with small dark puce-coloured inflorescence; it is a desirable species. In the name of Mr. Pawley, White Hart, Bromley, there was a good specimen of E. cylindrica, with its long, upright, salmon-coloured blossoms, of which this species is very prodigal. E. vestita cárnea, from the same individual, was likewise dwarf, and finely cultivated. From Mr. Kyle, gr. to D. Barclay, Esq., Leyton, Essex, there was a handsome plant of E. suaveolens, which had numberless large heads of thickly-disposed, pale pink, and sweet scented blossoms. E. vestita coccínea, bearing bunches of brilliant red blooms, was plentifully exhibited; and there were other good varieties of the same species. Still, the varieties of E. ventricosa claimed and received universal admiration; and they are, perhaps, unrivalled, both in respect to foliage, habit, or the profusion, delicacy, and showiness of their flowers, or the facility with which they may be brought into and retained in a favourable condition. If, however, all were arrested by the specimens of old and familiar kinds, every one must have felt astonished on beholding no less than 23 new and apparently distinct varieties of E. ventricosa, from W. H. Storey, Esq., of Isleworth. We confess we were at a loss whether to be most surprised at the diversity of colour and aspect, or the uniform dimensions and robustness of the plants. Each was as near as possible of the same height and diameter, and all were peculiarly verdant, as well as prolific of bloom. They might be taken as a convincing proof of what can be done in the hybridisation of Heaths. It should be stated that there were 4 plants, but that there were 3, 4, or more specimens of some of the sorts.

The precedence which we have just given to the Heaths would, if gorgeousness of inflorescence, without reference to variety, had been consulted, have been strongly contested by the Cacti. Of these there were some that were never before equalled, especially a specimen or two of Cactus speciosus. One in Mr. Green's large collection reminded us of his noble Azáleas at the last meeting. It was about 5 ft. high, and trained to a kind of crescent-shaped trellis, between 2 and 3 ft. broad, the flowers being brought to the front, and there collected with such extreme density, that they were literally prevented from expanding properly. Where an extraordinary brilliancy of effect is required, this mode of training cannot be excelled. It was also adopted with some of the Epiphylla. When, however, the blossoms are wished to stand out distinctly, so as to invite and bear individual examination, the best system of training is to use a barrel-shaped trellis, which opens out gradually and slightly towards the top. A plant of C. speciosus, trained to a trellis of that description, 6 ft. in height, was brought by Mr. Upright, gr. to J. Ridge, Esq., of Morden, Surrey. It was grafted on C. speciosíssimus, and was blooming most profusely. The same cultivator had another specimen of C. speciosus, scarcely 4 ft. high, very broad, and extremely rich in flowers; and there was a plant in all respects similar from Mr. Bruce, gr. to B. Miller, Esq. Mr. Falconer, gr to A. Palmer, Esq., of Cheam, had one supported by a trellis of a pointedly conical form, and this was exceedingly fine. From Mr. Bruce, there was also a particularly large-blossomed variety of C. speciosus, which seems to be well deserving of attention. C. speciosíssimus was shown in a state which one would hardly think could be surpassed, by not a few growers. Its stems were occasionally from two to three inches thick; which amazing luxuriance is obtained by allowing a sufficiency of pot-room, mixing a large proportion of decaying manure with a rich loamy soil to pot it in, and afterwards applying manured water frequently while the plant is growing, or covering the earth with a mulching of manure, over which ordinary water is poured. It might be assumed that such great exuberance is incompatible with the free production of flowers; however, by exposing the plants to the sun in the open air for six weeks or two months in early autumn, a flowering propensity is excited, and the blossoms are larger and richer than those of specimens under common treatment. The plant which had the largest flowers was from Mr. Goode, gr. to Mrs. Lawrence, Ealing Park. Mr. Upright, Mr. Green, Mr. Barnes, and various other culturists, had some splendid specimens present. They were, for the most part, trained spirally round a cylindrical trellis, though some had their stems supported erectly on a similar frame. Of C. Jenkinsoni, Mr. Falconer and Mr. Bruce brought admirable specimens: that of the former was 4 ft. high, and richly clothed with flowers; that of the latter not quite so tall, yet extremely dense and splendid. C. Mallisoni was sent in a well-grown state by Mr. Pawley; and Mr. Bruce also exhibited it on a conical trellis, 3 ft. high, trained in a densely spiral manner, and very thickly laden with bloom. There was, moreover, a new hybrid Cereus, from Mr. Pawley, which is scarcely distinguishable from C. Jenkinsoni, except that it has paler red flowers, and flatter stems, which are unusually strong and healthy. The Epiphyllum Ackermanni, among Mr. Green's plants, and this species or the E. spléndidum, from Mr. Catleugh, of Chelsea, were probably superior to anything of the kind in point of culture. Being three feet in height, they formed one continuous pile of bloom from the base to the apex; and no person, who is aware of the expansive and flexible character of the blossoms of this plant need be further apprised, that the specimens in question were inconceivably grand.

In the class of Orchidáceæ, which merits notice immediately after, if not before, the Cacti, there was not only a more numerous, but a richer collection of showy sorts than at the May exhibition. A better display could not reasonably have been expected; and the company evinced its taste for these exquisite objects by crowding throughout the whole day that portion of the tent in which they were located. The large-flowered kinds included several varieties of Cattleya Móssiæ, from Messrs. Rollisson, of Tooting; they differed mainly in the colour of their flowers, and slightly in their dimensions; C. M. superba we give the names under which they appeared), has the lip of its flowers brightly mottled with sanguineous purple and yellow, and the outer parts darker than usual; C. M. pállida has nearly white sepals and petals, with pale lilac markings in the lip, and is altogether a smaller flower; C. M. atropurpúrea has its outer members of the hue of C. labiata, and the lip richly stained with a dark purplish tint; C. Mossiæ itself has a lip of a hue between that of the first and second varieties in the above list. In all, the giant size of the blossoms, the gracefully relieved character, delicate tints, and peculiar transparency of the sepals and petals, with the pleasingly mingled variegation, and beautifully undulated margin, of the lip, combine to render them worthy of being ranked with the loveliest objects in creation. Not a whit the less beautiful, nor much behind them in size, are the blossoms of Vanda teres, also from the nursery of Messrs. Rollisson; and its habit is infinitely more characteristic and interesting; it has a tall slight stem, (which throws out its roots into the air,) and leaves of a cylindrical figure: the flowers appear in a raceme near the top of the stem; the sepals and petals being deep pink, and the lip superbly streaked and mottled with reddish purple and yellow on a light ground: the specimen was finely in flower. Of a dissimilar nature, but, if possible, yet more enchanting, was the Saccolábium guttatum, likewise from the Tooting Nursery; hanging on a log of wood, with thick, fleshy, pendent, uncovered roots, it was sending forth five or six drooping racemes, at least a foot in length, completely enveloped from end to end in charming pink and white inflorescence. There was, besides, a superior variety of the much-admired Aërides odoratum, with larger flowers, and longer racemes than it commonly produces; the odour of the blossoms is comparable to nothing but that of the Lily of the Valley: also a fine plant of Oncidium Harrisóniæ, surprisingly healthy; O. unicorne, a small flowered species, with a single projecting horn in the centre of its floral lip; and a new species of Calanthe, from Northern India, with bright purple blossoms, the labellum of which is conspicuously cordate, and possesses a darker hue, with a few species of inferior attractions, completed Messrs. Rollisson's collection. Mr. Mylam, gr. to S. Rucker, Esq., of Wandsworth, brought forward Saccolabium guttatum with seven racemes, a noble plant; a larger variety of S. guttatum, supposed to be S. præmorsum, the blossoms of which are a little paler than those of the previous species, more diffused, and in larger racemes; and Camarotis purpurea, an allied Indian plant, with airy Vanda-like stems and roots, and pendent racemes of lively pink flowers. Mr. Mylam produced, in addition, a grand variety of Oncídium crispum, grown to very high perfection: O. flexuosum, with quite a thicket of ascending stems, divaricating at the summit, and bearing numberless bright yellow and brown flowers; Broughtónia sanguinea, which few can grow to perfection, but which was here flowering admirably; Epidendrum elatum, in excellent order; E. cinnabarinum, developing its specious reddish blooms; Dendrobium moschatum, 6 ft. high, flowering splendidly in at least a dozen racemes; the curious Coryanthes macrantha, whose flowers, were they destitute of colour, would look more like an anatomical dissection; and Cypripédium húmile, exhibiting, in the lively verdure of its interesting foliage, its numerous stems, and frequent white and pink blossoms, an extraordinary degree of skilful culture. A very noble plant of Calanthe veratrifólia aided, by no means unworthily, in composing Mr. Green's large collection. Cymbídium aloifólium, with its flower-scapes supported erectly by stakes, was from Mr. Barnes, and had not, to our eyes, so agreeable an appearance as when the flowers are left to hang down naturally. Oncídium Lanceanum, well grown, was contributed by Mr. Goode, gr. to Mrs. Lawrence. The hues, dimensions, and mode of production of its blossoms, stamp it as a species of transcendent value. Mr. Goode showed, besides, a gigantic specimen of Gongora atropurpúrea, which, with its luxuriant pseudo-bulbs and leaves, the length and tenuity of its flower scapes, and its singular dark purple flowers, which appear to be the skeleton of some strange insect, had a very enlivening effect. A variety of Dendróbium Pierardi, which would seem to have accidently bloomed at this season, was furnished by Mr. Hunt, gr. to Miss Traill, of Hayes; and Mr. Hunt had also at the exhibition a specimen of the white lipped variety of Epidendrum macrochilum, extremely well grown, and one of Oncídium flexuosum, the flower-stems of which were fastened down to an almost globular trellis, so as to give the whole a highly novel and engaging appearance. A plant, similarly managed, was, moreover, sent by Mr. Bruce, gr. to B. Miller, Esq., of Mitcham; and such was the remarkable attractiveness of both specimens, that we could wish to see the plan perpetually adopted. Of course the flowering branches (that is, the short external ones) were suffered to protrude beyond the trellis, so that nothing like formality of training was perceptible. Oncídium púmilum, in the richest health, and exceedingly fertile of blossoms, came also from Mr. Bruce, who, by cultivating this and some more species of Oncídium in a common cool stove, succeeds to admiration. From the Duke of Devonshire's gardens, at Chiswick, Mr. Edmonds supplied Peristéria péndula, with two particularly large scapes of bloom. The flowers are not only attractive for their pretty spotted aspect, but for the striking likeness to the shape of a dove; which the outline of their column (or the projecting portion in their centre) presents.

To proceed with the different natural tribes in the order which they respectively merit, we arrive now at the Climbers. We must repeat our regret that the exhibition of these plants is so lamentably disproportionate to the encouragement offered to the cultivators, and hope that more attention is paid to them privately than was manifested by this show. The plant which gratified us most was one of Passiflora Kermesina, supported by a cylindrical trellis, not more than 4 ft. high, and covered in at the apex. Round this trellis the plant was pretty closely twined, and was blooming in a very interesting manner. It was to us the more pleasing, as being one among the many evidences, that climbers of a spreading character may advantageously be kept in a pot, and confined within prescribed limits. The specimen was from Mr. Foy, gr. to R. Alston, Esq.; and it is a fact which ought to be more commonly known, and which we mention here with the view of accomplishing that end, that P. Kermesina often sheds its flowers when grown in a very hot stove, but opens them liberally and perfectly, when the temperature of the house is reduced to a little above that of the greenhouse. The most varied collection of climbers was contributed by Mr. Goode: it comprehended Aristolóchia ciliosa, a species of rather dwarf habits, with small, by no means showy, but curious blossoms; Manéttia cordifólia, on an upright barrel-shaped trellis, 4 ft. high, very healthy, and profusely decorated with flowers; two other specimens of the species, on globular trellises, distinguishable for the most perfect cultivation, which is apparently attained by the use of a pretty rich soil, and by gradual shiftings till they are brought into large pots: Kennédya monophylla, 5 ft. in height, closely twined round an erect cylindrical trellis, and particularly handsome; Ipomœa Hardingii, probably the same specimen as was at the last exhibition, on a low trellis, and well-flowered; Ipomœa Horsfálliæ, evincing similar capabilities of being trained on a dwarf barrel trellis, yet with only the remains of its splendidly-coloured blossoms; Tropœ'olum edule, inclined to be sickly; Thunbérgia grandiflora, in great luxuriance, sparingly studded with inflorescence; Stephanotis floribunda, a noble plant, flowering abundantly, and promising yet greater fertility; and Æschynanthus maculatus, growing over a large globe of moss, inclosed within a wire trellis: although it was blooming well, the moss had too artificial an outline, and did not enhance the appearance of the plant so much as a rustic and branched block of rough wood would have done. Mr. Green brought Tropœ'olum edule in the rudest health, and flowering very handsomely; from the rich orange hue of its blossoms, it bids fair to become a favourite companion to T. tricolorum and brachyceras; like these species, it is seen most favourably when fastened to a flat trellis, which can have any desired contour. Gompholóbium polymorphum was shown by Mr. Barnes, in the direct reverse of its usually weak condition, being grown on a trellis 4 ft. high, which extended partly down over the pot, and was very generally clothed with flowers; it is an elegant plant, and, conjointly with the Tropœ'olum, to which allusion has just been made, requires a trellis with a flat surface, that its scanty branches and foliage may be atoned for by close training. Clématis Sieboldi, judiciously trained to a flat face, and elegantly bedecked with its showy two-coloured flowers, was from Mr. Pawley, of Bromley. A plant of Russéllia júncea, 6 ft. in height, and creeping prettily over the edges of the trellis, as well as from all parts of its sides, graced the collection of Mr. Green; although more a trailer than a climber, it may be ranged with the latter group. Mr. Pawley, of Bromley, brought a fine specimen (4 ft. in height) of Kennédya monophylla, or what appeared to us to be such, under the name of K. bimaculata, possibly relating to the two spots existing in the white portion at the base of the floral standard. A new Manéttia, which has received the title of M. bicolor, from its red flowers passing into yellow towards the summits, came from Mr. Veitch, of Exeter: its leaves are lanceolate and pubescent, while the flowers, which are small, have the two colours above named. Hoya carnosa, however old, is still to be admired for the beauty and durability of its wax-like blossoms, and for its fine, evergreen, shining leaves. It was shown by Mr. Joynes, gr. to Mr. Hall, Totteridge, Herts, to be well suited for growing on a low trellis, on which it produced an excellent effect. Mr. Hogan, gr. to H. Pownall, Esq., Spring Grove, contributed a good Sóllya heterophylla, one of the best of climbers; and Anagallis Monelli, which is not a climbing species, but was affixed to a spherical trellis, 2 ft. in height; the brilliant blue colour of its blossoms, of which there was a prodigious quantity, fitted it to vie with almost anything in the exhibition; it is made thus to assume a climbing habit, like Verbenas, by plucking off the flowers as they appear, and stopping the shoots till they evolve a due proportion of laterals: the practice may be recommended, as we know of no other state of the plant at all comparable to this.

The exhibition not being intended for hardy plants, very few were sent. Mr. Gaines, of Battersea, furnished an extremely beautiful new Digitalis, or Foxglove, the blooms of which are large, almost white, with numerous spottings and blotchings, of a purplish tint, in the throat. Campanula grandis, an exceedingly fine new species, approximating to C. pyramidalis, but much excelling it in splendour, was placed on the table, from the gardens of the Horticultural Society. Half-hardy plants included a novel Verbena, called Frosteana, from Mr. Frost, gr. to Lady Granville, at Dropmore; the colours of its flowers are a blending of crimson, or deep pink, and scarlet: and it bears them in tolerably copious heads. Mr. Ivery, of Peckham, contributed another seedling Verbena, more in the way of V. teucrioides, but having shorter and denser bunches of flowers, with less of pink in them, and a dwarfer as well as more compact habitude. Erythrina Crista-galli, which is hardy in some situations, was produced in a copiously blooming state by Mr. Goode and Mr. Bruce, the respective gardeners of Mrs. Lawrence and B. Miller, Esq. Mr. Veitch, of Exeter, forwarded an Alstræmeria nemorosa, which is considered a novelty; the sepals of the rather small flowers are of different shades of red, and the petals are yellow, more or less broadly streaked with dark brownish red. The valuable tribe which, for the sake of distinction we call dwarf greenhouse shrubs, was rich in handsome species and specimens. These qualities were united in many instances: one of the most observable of which was the Polýgala oppositifólia of Mr. Falconer, gr. to A. Palmer, Esq., Cheam; 3 ft. in height, and as much in diameter, this plant formed a mass, which, down to within 6 or 8 inches of the pot, had scarcely an inch of its surface unornamented by a cluster of its beautiful flowers; in fact, we examined it attentively for some time, and could not perceive how it might be improved. Surpassed solely by the showiness of the flowers of the Polýgala, was a specimen of Borónia denticulata, of about the like dimensions, from Mr. Barnes, and another from Mr. Hunt, gr. to Miss Traill, the branches were dense, almost to crowding, and the principal difference between the two was, that the latter cultivator's plant was a little more diffuse on the outside, which rather heightened its beauty. The plant produced by Mr. Clarke, however, gr. to M. J. Smith, Esq., was 4 ft. high, 5 ft. across, and truly wonderful. The specimens of Borónia serrulata were, as usual, models of culture. The best that we observed, seemed to be that from Mr. Hunt, gr. to Miss Traill; it was 3 ft. high, the same across, and in every respect perfect. The Borónia vimínea brought by Mr. Barnes, though deficient in an ornamental point of view, and having small foliage, as well as comparatively diminutive flowers, is one of the neatest and most symmetrical of greenhouse plants; its leaves have the scent of Fennel or Tarragon. Approaching very closely to Mr. Falconer's specimen of Polýgala oppositifolia was one, a foot higher, by Mr. Bruce, gr. to B. Miller, Esq.: and the Polygála acuminata belonging to Mr. May, gr. to E. Goodhart, Esq., while it was not behind the other in flowers, had slightly superior foliage. The Chorozema ovatum, which has been nearly lost to country on account of the difficulty of preserving it in health, was shown by Mr. Green, in a better condition than many of the more easily grown species are often seen; it was trained on a conical-shaped trellis, above 2 ft. high, and the brilliant flowers were regularly distributed over the entire surface. The dwarf variety of C. várium accompanied the preceding species: and, though not higher than a foot, constituted a very enchanting little object. C. cordatum, 3 ft. in height, was in the collection of Mr. Goode. It offers a great contrast in habit to the two just described, yet it is not the less pleasing for the laxness of its growth, when, as in the case before us, the shoots have been duly stopped, and induced to send out laterals. The highly odoriferous Gardénia radicans, which may probably, with more propriety, be classed with stove species, was astonishingly well cultivated by three or four exhibitors. It was rendered peculiarly striking (we suppose through pruning and tying down the shoots) by being prevented from growing higher than 6 or 9 inches, and yet forming a shrub 3 or 4 ft. in diameter, with the outer branches inclining downwards. Mr. Catleugh's plant may be named as an example of this treatment. Mr. Goode, Mrs. Lawrence's gardener, had a plant of Stylídium fasciculatum, which exceeded our highest expectations of this very interesting species. It was about 18 in. high, considerably broader, and quite laden with blossoms, some of the spikes of which we should consider from 9 in. to a foot long. Three or four good species of the genus Pimelea were at the exhibition. P. spectábilis, which is unequalled in the size and speciousness of its flower-heads, was brought by Mr. Green, finely grown, but the flowers fading. P. sylvestris was another of Mr. Green's plants, 3 ft. in height, its stems and branches being totally screened from the eye by the flowers. Of P. decussata, there were so many and such capital specimens, that it would be invidious to specify one or two; and we have not space to notice all. Two hybrid Pimeleas were transmitted by Messrs. Garraway, Mays, and Co. They had narrow decussate foliage; and one bore dark pink or crimson flowers, the other, pale blush. They came nearest to P. decussata, but were smaller. P. rósea, 18 in. high, was from Mr. Barnes, and was intensely beautiful. A specimen of Diosma uniflora, 4 ft. in height, from Mr. Green, was singularly handsome and prolific of bloom. The invaluable little Leschenáultia formosa was uncommonly abundant. Mr. Green's plant was peculiar for partially inclosing the pot, which is doubtless an agreeable feature. Mr. Barnes's was conspicuous for its dwarfness; one of Mr. Hunt's for its height (nearly 4 ft.), and its apparently declining condition; the other for its lowness and breadth; Mr. Clarke's likewise for its breadth; Mr. Falconer's, for its flowers being brought chiefly to one front; and another, belonging to Mr. Clarke, gr. to M. J. Smith, Esq., was the handsomest plant present, but had the fewest flowers. There were also many plants of Helichrysum púmilum, the blossoms of which were at this period beautifully expanded, and looked particularly gay. Correa speciosa, in a very robust state, was from Mr. Clarke. Chorozema várium, 4 ft. high, bushy in proportion, and both healthy and prolific; Coleonema tenuifólia, 5 ft. from the pot, and very fine; with Dillwýnia pungens, 18 in. in height, and full of flowers, came from Mr. Barnes. Mr. Fraser, of Leyton, Essex, sent Epacris grandiflora, dwarf yet handsome, and another specimen, 6 ft. high, the flowers of which were decaying. Anagallis fruticosa, a subshrubby species, with numerous flowers that are not unlike those of A. arvensis, only larger, was supplied by Mr. Joynes, gr. to Mrs. Hall, Totteridge, Herts. The rare Mirbélia undulata, with its prickly leaves and deep pink blossoms, appeared in Mr. Hunt's group. Mr. Jackson, of Kingston, furnished Campánula rupestris, a pretty trailer, bearing large quantities of light blue blossoms; and an Azálea, named fulgens magniflora, producing large and tolerably well-formed reddish crimson flowers. Azálea Danielsiana, 3 ft. in height, was in Mr. Green's and Mr. Goode's collections, and looked very splendid. A plant, 18 in. in height, of Dillwýnia speciosa, from Mr. Catleugh, was beautifully in bloom. Euchilus obcordatus, 2 ft. above the ground, with a profusion of neat yellow and brown flowers; Arthropódium paniculatum, handsomely grown; Xanthósia rotundifólia, extremely dwarf, close, and vigorous. Polýgala speciosa, excellently cultivated and blossomed; Acácia pulchella, 6 ft. from the pot, and A. alata, about 14, were all brought by Mr. Goode, gr. to Mrs. Lawrence. From Mr. Green, there was a good Leschenaultia bíloba, 3 ft. high, but with scattered blossoms; Coleonema tenuifolia, 5 ft. in height, admirably flowered; and Eriostemon buxifolium, a handsome plant, though the blooms had parted with something of their freshness. Some superb Hydrángeas belonged to J. Ridgway, Esq., of Roehampton. In the Fúchsia tribe, there was F. corymbiflora, 6 ft. high, from Mr. Green, very handsome; a dwarf plant, only 3 ft. in height, from Mr. Goode; and another, 4 ft. from the soil, extremely rich and splendid, from Mr. Bruce. F. Chandleri was exhibited in a finely-grown condition, by Mr. Catleugh, and Mr. Kyle, gr. to B. Barclay, Esq. A new variety, with somewhat similar flowers to the last, yet of much taller growth, and partaking, in the leaves, of the character of F. corymbiflora, was produced by Mr. Catleugh. Another novel kind, having a slender habit, small and narrow leaves, and flowers with whitish-pink sepals, purple petals, and crimson stamens, was from Mr. Cripps, of Tunbridge Wells. The other greenhouse species were, Abútilon striatum, from Mr. Goode; a standard plant, above 12 ft. in height, drooping gracefully, and decorated liberally with its elegant flowers; a species of Indigófera, with pretty pink blossoms, from Mr. Mackay, gr. to S. Ricardo, Esq.; a new Dillwynia, like D. rudis, trained over a trellis, inclining outwards from the bottom, and very ornamental in itself, but inappropriately supported; and a Statice, received from Mr. Harding, gr. to the Rev. F. Beadon, North Stoneham, Hampshire, with the name of S. grandiflora, but evidently the one called S. Dickensoni. It has large and beautiful pink flowers, which it produces abundantly, and the specimen was well cultivated. Stove plants were quite scanty, compared with the greenhouse species. The new Achímenes longiflora, with its splendid Petúnia-like blue flowers, was there from three cultivators; but the specimens were not remarkable either for size or good culture. The Gloxínias, in most collections, with a violet-flowered one in that of Mr. Hunt, and also a Sinningia guttata, were cultivated with great skill, and had a most beautiful appearance. Rondelétia odorata, 4 ft. high, was shown by Mr. Green, in a surprisingly bushy, as well as free-flowering, state. Ixora coccínea did honour to not a few growers, whose names it would be tedious to mention, and contributed powerfully to the brilliancy of the show. Although possibly more of a Greenhouse than a Stove plant, Státice arbórea may be noticed here as being singularly frequent, and more than ordinarily well managed. The specimens, from 2 to 3 ft. high, were invariably healthy, and richly in flower. Another plant, which probably belongs to the Greenhouse, is Angelónia grandiflora, which was exhibited, in a good flowering state, by Mr. Jackson and Mr. Goode. The latter person had, besides Pleroma heteromalla, nobly luxuriant, and flowering well, Asclepias curassávica, unusually rich; Lemonia spectabilis, a novel evergreen, with shining foliage, and large, solitary, deep crimson blossoms; the Medinilla erythrophylla, with handsome leaves, and small pink blossoms, in clusters, on the lower parts of the stem; Brugmánsia floribunda, not thoroughly in bloom; Pavetta caffra, 9 ft. high, a splendid tree; and a superb variety of Clerodendrum speciosíssimum, flowering when only two feet in height. Mélia Azederachta, with a stem above four feet high, branching out, and composing a handsome head with its five-pinnate foliage and pretty pinkish white flowers, which have a purple centre, was from Mr. Joynes, gr. to Mr. Hall. By Mr. Hunt, gr. to Miss Traill, was shown an immense plant of Crinum amábile in full bloom; Clerodendrum squamatum, five feet high, particularly rich; C. speciosíssimum, flowering profusely, at the height of two feet: and a new species of Gesnera, which has very striking flowers, and was especially well cultivated. Finally, there was an enormous plant of the interesting Lycopódium stoloníferum from Mr. Jackson, of Kingston; a large and rich Melocactus communis, with its singular cap or tuft at the apex, from Mr. Hogan, gr. to H. Pownall, Esq.; and Adiantum cuneatum, spreading, pretty, and in perfect flower, from Mr. Falconer, gr. to A. Palmer, Esq., of Cheam. The florist's flowers, by which are meant Roses, Pelargóniums, Calceolárias, Pansies, Ranunculuses, Pinks, &c., were shown in tolerable profusion, and many of them were decidedly fine.

The Roses, which were not so select as usual, were a few days too early; and but few varieties of Moss Roses were in bloom, or of the Rosa Gállica, Alba, or Damask. Those shown were principally Chinese Roses, and their hybrids; established sorts, such as Brennus, Fulgens, George the Fourth, Coup d'Amour, Daphne, General Allard, and many others, that prove to be very early bloomers, and consequently on that account desirable. The hybrid perpetuals were also in great perfection; among them, Prince Albert, one of the earliest; Madame Laffay, Aubernon, Fulgorie, Comte de Paris, and Clementine Duval, were conspicuous. This class of Roses comprises some of the earliest bloomers, and yet they continue to flower till November; proving how valuable an addition they are to the garden. Some discrepancies appeared to exist among the growers as to classing their Roses: Hybrid Perpetual and Hybrid Chinese were by some placed among "Garden Roses;" by others, among "Chinese and Hybrid Roses," in accordance with the directions issued by the Society. In Mr. Rivers's collection, the following particularly attracted our notice: *Hybrid Perpetuals*—Fulgorie, Aubernon, De Neuilly, Clementine Duval, Comte de Paris, General Merlin, Madame Laffay, Marshal Soult, Prince Albert, Prudence Rœsér, Rivers, Ciceley. *Hybrid China*—Belle Marie, Blairii, No. 2; Beauté Vive, Comtesse de Lacepede, Charles Duval, De Candolle, General Allard, Great Western, Kleber, Le Météore, Mrs. Rivers, Sylvain, Triomphe de Laqueue. *Rosa alba*—La Seduisante, Sophie de Marsilly, Princess de Lamballe. *Damask*—Déesse Flore, La Fiancée, La Chérie, La Soyeuse, La Ville de Bruxelles, Madame Hardy. *Rosa Gallica*—Eclat des Roses, Sir Walter Scott, Pulchra marmórea, Woodpigeon, Royal marbled, &c. &c. *Austrian Briars*—Globe Yellow, and Rosa Harrisoni. *Bourbon*—Madame Nerard, Bouquet de Flore, Acidalie, Madame Margat, Ceres. *China*—Archduke Charles, Clara Sylvain, Etna, Mrs. Bosanquet, &c. *Tea Scented*—Bougère, Eliza Sauvage, Goubault, Prince Esterhazy, Safrano, &c.

The beauty of the Pelargóniums contributed more than an ordinary share to the splendour of the exhibition. Many persons were apprehensive from the heat of the weather and the journey to the Gardens that the bloom would have been deficient; but owing to the good management of the growers but little difference was discernible. Mr. Bell, of Chelsea Hospital, in the amateur's class, exhibited a collection of well-managed plants, for which the gold medal was awarded; Erectum, Coronation, Florence, Una, Bridesmaid, and Comte de Paris, were successfully grown. The collection that competed with this, was from Mr. Bromley, gr. to Miss Anderson, to which an inferior medal was given; a circumstance arising no doubt from the presence of some old and worthless kinds in the collection—for the Beauty of Ware, Lady Murray, and Diadematum rubescens, again made their appearance; such flowers must always prove detrimental to the success of an exhibitor—and this it is to be hoped will be their last appearance here: the plants in this collection were generally well grown. In small collections from Amateurs, Mr. Bourne, gr. to Sir E. Paget, gained the first prize; Erectum, Chelsea Pensioner, Florence, and Climax, were conspicuous; the plants were compactly grown and in good condition. The other collection from Mr. Hart, gr. to Miss Trail, was too much drawn up; Leila looked admirably, and the flowers showy—but from their size, out of character. In the Nurseryman's Class, Mr. Catleugh gained the gold medal for his collection of twelve well-grown varieties—Lord Mayor, Victory, Lumsden's Madeleine, Florence, Lifeguardsman, Priory Queen, Coronation, Hannah, Una, Prince Albert, Orange Boven, and Selina; these plants were exhibited in great perfection; they were grown short, spread out, and uniform in size; and all carried a fine head of bloom. Lumsden's Madeleine, Priory Queen, and Orange Boven, excited admiration from their being literally covered with flowers. Mr. Gaine's collection was also exceedingly well bloomed; the plants were rather smaller than Mr. Catleugh's; Sylph was shown with a fine head of flowers. One or two white varieties would have improved the general effect of this collection, which consisted of Leila, Jones, Exquisite, Raphael, Grand Duke, Victory, Beatrice, Cerito, Erectum, Coronation, Sylph, Album perfectum, and Jenny. In collections of six varieties, Mr. Catleugh took the lead, for Lord Mayor, Madonna, Victory, Ophelia, Jewess, and Joan of Arc; these were six plants of very fine growth. Mr. Gaines among others exhibited Garth's Perfection in splendid condition, and Countess Cooper also: the rest were rather drawn and deficient in bloom, a circumstance that might arise from the weather and their journey to the Gardens.

The seedling Pelargoniums were numerous, and the desire to view them was in no degree abated: the tent in which they were exhibited was thronged with visitors, and pencils and memorandum books were in request, to note down the most striking varieties. Those selected by the judges, as flowers of superior merit, were the following:

Foster's Sultana, a beautiful and brilliant flower, of a superior form; lower petals delicate salmon, the upper petals crimson, into which is infused a mixture of scarlet, which, with the dark spot, gives the flower a distinguished appearance: Foster's Sir R. Peel; this variety is an acquisition, as it supplies a great desideratum among the purples, a class in which we are very deficient; it is finely formed, the petals stiff, and the flower, when fully expanded, retaining a cupped form; the upper petals have a large rich spot, gradually softening to the edge of the petal, which is free from the mottled appearance usually seen: Foster's Nestor; delicate warm pink under petals, the upper petals have a large maroon spot softening to the edge; the flower is very large, and finely formed: Foster's Sunshine; this is a most brilliant variety; the lower petals are of a bright scarlet salmon colour, with a slight tinge of blue in the centre, the upper petals are of a deep brilliant scarlet, with a dark spot; this flower attracted great notice, from its extraordinary colour: Beck's Leonora is a beautiful flower, surpassing all heretofore produced in the same style; the upper petals have a dark rich purple maroon spot, which terminates abruptly, leaving an edge of bright rose colour surrounding them; the lower petals are delicate rose; the flower is finely formed; to each of these seedlings the silver Knightian medal was awarded. To a well-formed flower of good properties, named the Duke of Devonshire, a silver Banksian medal was given; and certificates to the Model of Perfection, a flower of good form, rich spot, pink under petals, with white centre; and Meteor (Beck's), attractive from its great delicacy and richness, having a dark velvety maroon spot in the upper petals, contrasting with very delicate under petals. In many cases the flowers exhibited were not shown according to the rules laid down by the Society, and were consequently disqualified—it is expressly stated that "seedling Pelargoniums are to be exhibited in single trusses, with a leaf; the truss to be elevated above the leaf." Where this rule was not complied with, the flowers were passed; and several fine flowers had to be put aside on this account. There were other seedlings meriting attention, which had not been caught exactly in perfection. It is difficult, in seedlings of the current year, to accomplish this, but as the show in July will afford another opportunity, it is to be hoped several of those, now unsuccessful, will again make their appearance under more favourable circumstances. From their being so numerous, those that did not receive prizes embraced flowers of various degrees of merit. It must have been a task of great difficulty, considering the state of the weather, for growers to produce their seedlings in good condition; in the case of those of the current season with one truss only, promising to be in time for the exhibition, the retarding its flowering or pushing it forward, to have it in perfection, must have caused great anxiety—and in many cases the greatest care and vigilance appear to have been baffled. A very fine seedling in Mr. Beck's stand, named the British Queen, was evidently past its prime; this was a large flower of good substance, novel in appearance, and one which promises to form a desirable addition to this class. Lucy also and the Morning Star, in the same stand, were both worthy attention. A high-coloured variety, named Count D'Orsay, exhibited by Mr. Pamplin, was much noticed; and among Mr. Foster's flowers, the Favourite, which had been exhibited on a former occasion, and Tasso, a specimen with remarkably fine upper petals, were much admired. We cannot pass this stand without adverting to the admirable manner in which Mr. Whomes, gr. to E. Foster, Esq., exhibited his flowers, an example worthy imitation; each truss stood clear above the leaf, requiring no examination by the judges to ascertain whether the regulations published by the society had been complied with.) A curious repetition of the Priory Queen was exhibited by Messrs. Lucombe and Pince, called Rosaline, but an evident improvement in form upon that showy variety, and the Beauty of Werslade, a large flower novel in colour. In another stand, the Countess of Morley, a fine variety of good form and colour, appeared, but was disqualified, from being exhibited with two trusses instead of one; a mistake which appears to have been committed in many cases. A plant of Mr. Gaines' Rising Sun, with its clear vermilion flowers, was much admired; and Garth's Queen of the Fairies, with its sparkling trusses of pure white and maroon received its due share of notice.

The display of Calceolarias was not so splendid as at the former meeting; the season is getting a little past for seeing these flowers in their greatest beauty. The collection of shrubby kinds from Mr. Barnes exhibited no signs of the season being on the wane; his plants were in profuse flower; and Mr. Gaines' peculiar sorts, that have the appearance of being covered with powder, were also covered with bloom. Among the seedlings were many fine and promising kinds; those selected by the judges as desirable varieties or as improvements upon those we already possess, were Delicatíssima and Shrubby Perfection, from Mr. Barnes' collection, and Unique and Purpúrea grandiflora exhibited by Mr. Green; that grower's collection of seedlings were all considered worthy of cultivation, consisting of the following sorts:—Alba coccínea, Queen of Beauties, Queen of Fairies, Alba atropurpúrea, Sulphúrea superba, Emperor, Joan of Arc, Alba élegans, Flora superba, Princess, Magnet, Prince of Wales, and Alba purpúrea.

A stand of Ranunculuses, from Mr. Lockhart, contained many fine specimens in perfect condition; these beautiful flowers have been greatly improved within a few years; and the size, beauty of colour, and delicacy of the edging in many of the blooms excited much admiration. The Pink is not at present so popular a favourite as it deserves; to those who admire the flower, Mr. Willmer's stand of large and well-bloomed varieties, would prove acceptable. The weather has latterly been very unfavourable for blooming the Heartsease in perfection, and therefore we were not surprised to find the display of these flowers less fine than usual.

We cannot say a great deal in commendation of the fruit. Among Pine-apples, two large Providences, hardly ripe, from Mr. Fish, gr. to H. Oddie, Esq., Colney House, Barnet; some good Ripley Queens from the same gardens; and six Queens, of moderate quality, from Mr. Dodds, gr. to Sir G. Warrender, were the principal articles in that part of the exhibition. Grapes, of various sorts, were largely supplied; the Black Hamburgh kind was sent, in fair condition, by Mr. Campbell, gr. to General O'Loghlin, Chalfont St. Peters; by Mr. Brown, gr. to Messrs. Clews and Co., Aston Green; by Mr. Henderson, Coleorton Hall; and Mr. Wortley, gr. to T. Maubert, Esq., Norwood. Superior fruit of the same variety was shown from Mr. E. Mitchell, of Brighton: and Mr. Dodds, gr. to Sir G. Warrender. Mr. Chapman's Black Hamburgh Grapes were small but beautifully ripened, as were those of Mr. Atlee, gr. to R. Beaufoy, Esq. Those of Mr. Bell, nurseryman, Norwich, were ripened in a superior manner; and the berries of those brought by Mr. Davis, gr. to Sir S. Clarke, and Mr. Foy, gr. to E. Alston, Esq., were large, yet pale. Mr. Short, of Bawtry, sent some Royal Muscadine Grapes, in tolerable perfection, and some Grizzly Frontignans that were pretty good. The White Muscat of Alexandria was shown in excellent condition by Mr. Davis, gr. to Sir S. Clarke; the White Sweetwater, particularly handsome, by Mr. Shields, gr. to Lord Blantyre; and the Cannon Hall Muscat, with large berries and fine bunches, by Mr. Campbell, gr. to General O'Loghlin. The Peaches from Mr. Fish, gr. to T. Sowerby, Esq., Putteridge Park, were respectable; the Peaches and Nectarines from Mr. Mitchell, gr. to the Queen Dowager, Sudbury Hall, were too much bruised in packing to allow any one to determine their merits; the Elruge and Violet Hative Nectarines, and Royal George Peaches, from Mr. Henderson, Coleorton Hall, were admirable, as were the Peaches from Mr. Dodds, gr. to Sir G. Warrender, and Mr. Shields, gr. to Lord Blantyre. The May Duke Cherries from the last cultivator, and from Mr. Leslie, gr. to J. Fleming, Esq., were as fine as possible; and so, likewise, were the Keen's Seedling Strawberries of Mr. Leslie, and Mr. Elliott, gr. to J. B. Boothby, Esq. A collection of Apples, preserved with wonderful plumpness, was contributed by Mr. Baldwin, of Turnham Green; among them was the Alfreston, which is an excellent and large Kitchen Apple, and bears profusely, as well on small as on large trees. Three Melons, of good quality, were forwarded by Mr. Loudon, gr. to S. Gurney, Esq.; and a large Cantaloupe Melon, by Mr. Reid, gr. to Sir G. Wilson, Beaconsfield. From Mr. Joynes, there was a brace of fine Cucumbers. A gigantic spike of the fruit of the Dacca Musa, with a dish of such as had fallen off from ripeness, was from Mr. Scott, gr. to Sir G. Staunton, Bart., and our notice of this may aptly finish the report. We cannot, however, avoid expressing our concern that so few exhibitors of flowers attach the names to their specimens. If they did but remember how much more attention would be attracted to them, were they correctly and legibly named, we are sure that the desire of distinction would alone be a sufficient stimulus to the adoption of this practice. Those who are inaccessible by such arguments, may probably concede as much to the convenience and comfort of visitors.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

June 8.—His Grace the Duke of Richmond, K.G., in the Chair. 65 gentlemen were elected Members. A letter was read by Mr. Pusey, from Mr. J. Williams, relative to the cultivation of the Vetch at East Ilsley last year. Mr. Williams stated that the Vetches were called "Racers;" they were planted on the 26th of August last: 2 bushels of Rye and 2½ bushels of Vetches being sown per acre on land of a moderate description, light red in colour, subsoil, one part chalk and the remainder gravel, of insufficient strength to grow wheat. The field lies unprotected on the north side of Ilsley Down. The feeding off commenced on the 5th of May, the crop being very good. The Vetches when reared up were as high as the hurdles, and there were none like them in that part of the country.—Mr. J. Hall, of Cambridge, submitted a new convertible cultivator, invented by himself.—Mr. Weiss, of Covent-garden, presented specimens of a manure from Amsterdam.—Mr. S. Taylor, of Stoke Ferry, submitted his new wire netting as a protection against hares and rabbits.—Mr. C. Pole presented copies of the local prize-lists of Derbyshire.—Sir J. Tylden communicated the effect of ammoniacal liquor on vegetation.—Sir P. Micklethwait suggested the adaptation of some contrivance to watercarts to water Swede Turnip-seed, after its sowing in dry seasons.—Mr. J. Barton expressed his willingness to submit to the council an account of "Boussingault's Theory of Crops."—The council will proceed on Wednesday, the 29th, to nominate judges for the show at Bristol, and to determine the prize-sheet for the meeting at Derby.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

June 14.—This exhibition took place in the Surrey Zoological Gardens, and, notwithstanding the excessive heat, was numerously attended; the plants, particularly the Pelargóniums, were remarkably beautiful. The following prizes were awarded: Class 1. *Amateurs*: for Pelargo'niums, 6 varieties: 1st *gold medal*, to Mr. Edmonds, for Victory, Orange Boven, Matilda, Coronation, Lifeguardsman, and Joan of Arc; 2nd, *large silver do.*, to Lady Paget, for Erectum, Eliza superb, Climax, Florence, Chelsea Pensioner, and Fanny Garth. Calceola'rias, 6 varieties: *middle silver do.*, to Mr. Edmonds, for Gaines' Bride, Thompson's Scarlet, Incomparable, Gaines' Purple, and two Seedlings. Roses, 12 varieties, in bunches; 1st, *middle silver do.*, to Mr. Seldon; 2nd, *small silver do.*, Mr. Davis. For a collection of 12 *single blooms: small silver do.*, Mr. Seldon. Pinks, 12 varieties: *small silver do.*, Mr. Procter. Ranunculuses, 12 varieties: 1st, *large silver do.*, Mr. Dowler; 2nd, *middle silver do.*, Mr. Trevers. Heartsease, 24 varieties: 1st, *large silver do.*, Mr. H. Brydges; 2nd, *middle silver do.*, Mr. Bawtree; 3rd, *small silver do.*, Mr. Edmonds. Class 2, *Gentlemen's Gardeners*: for the best Collection of Miscellaneous Plants: 1st, *gold medal*, Mr. Bruce; 2nd, *large silver do.*, Mr. Atlee; 3rd, *middle silver do.*, Mr. Paterson. Pelargo'niums, 8 varieties: 1st, *large silver do.*, Mr. Hudson. Calceola'rias, 8 varieties: *middle silver do.*, Mr. Roser; 2nd, *small silver do.*, Mr. Atlee. Roses, 15 varieties, in bunches: *middle silver do.*, Mr. Parsons. Heartsease, 36 varieties: 1st, *middle silver do.*, Mr. Hancock; 2nd, *small silver do.*, Mr. Foster. Best collection of Cut Flowers: 1st, *middle silver do.*, Mr. Bruce; 2nd, *small silver do.*, Mr. Inwood. Class 3, *Nurserymen, Florists and Market Gardeners*: Pelargo'niums, 12 varieties: 1st, *gold medal*, Mr. Catleugh, for Lifeguardsman, Una, Madeleine, Victory, Priory Queen, Coronation, Orange Boven, Selina, Ophelia, Madonna, Lord Mayor, and Joan of Arc; 2nd, *large silver do.*, Mr. Gaines, for Sylph, Joan of Arc, Gaines' alba perfecta, Gaines' Caroline, Erectum, Gaines' Cerito, Victory, Conservative, Beatrice, Gaines' Rising Sun, Garth's Perfection, and Gaines' Grand Duke. Best Collection of Miscellaneous Plants: 1st, *large silver do.*, Mr. Pawley; 2nd, *middle silver do.*, Mr. Catleugh; 3rd, *small silver do.*, Mr. Jackson. Calceola'rias, 12 varieties: *small silver do.*, Mr. Gaines. Ericas, 12 varieties: *middle silver do.*, Mr. Jackson, for E. ventricosa breviflora, quadriflora, élegans, exímia, vestita coccínea, trícolor, denticulata, depressa, vestita rósea, a seedling, and two others. Ranunculuses, 24 varieties: 1st, *middle silver do.*, Mr. Alexander; 2nd, *small silver do.*, Mr. Lockhart. Pinks, 12 varieties: *middle silver do.*, Mr. Norman. Best Collection of Roses, in bunches: *large silver do*, Messrs. Paul; *best collection of* 30, in bunches: 1st, *middle silver do.*, Messrs. Paul; 2nd, *small silver do.*, Mr. Brown. Heartsease, 50 varieties: *middle silver do.*, Mr. Henbrey. Open to all classes. Best 6 Specimen Plants: *large silver do.*, Mr. Atlee, for Fúchsia fulgens, Borónia pinnata, B. Serrulata, B. denticulata, Polýgala oppositifólia, and an Erica. Best Specimen Plant: 1st, *middle silver do.*, Mr. Bruce, Izora coccínea; 2nd, *small silver do.*, Mr. Jackson, for a variety of Erica trícolor. Best Collection of Orchidaceous Plants: *large silver do.*, Mr. Bruce, for Oncídium flexuosum, Broughtónia sanguínea and Oncídium púmilum. Best Seedling Heartsease: *small silver do.*, Mr. Brown.—Fruit. Pine Apple: *middle silver do.*, Mr. Hampton. Basket of Black Grapes: *middle silver do.*, Mr. R. J. Chapman. Best Basket of White do.: *middle silver do.*, Mr. R. J. Chapman. Collection of Fruit, exclusive of Grapes and Pines: 1st, *middle silver do.*, and 2nd, *small silver do.*, Mr. R. J. Chapman. Collection of Vegetables: 1st, *middle silver do.*, Mr. Gaines, for Artichokes, new Potatoes, Peas, French Beans, Cauliflowers, Turnips, Carrots, Cabbage and Cos Lettuces, Cucumbers, Radishes, Scorzonera, and Cardoons; 2nd, *small silver do.*, Mr. Martin, for Turnips, Carrots, Lettuces, Onions, Cauliflowers, Cabbages, Peas, new Potatoes, Cucumbers, Celery, and Horse-radish. Extra Prizes offered by members of the society.—*The large silver medal* offered to *Amateurs* by Mr. Catleugh, for the best collection of Pelargóniums was won by Mr. Davis. *The large silver do*, given to *Nurserymen*, by W. Davis, Esq., for the best collection of do. was awarded to Mr. Catleugh, for Garth's Victory, Penelope, Corunna, Witch, Prince of Waterloo, Gipsey, Hannah, Prince Albert, Jubilee, Comte de Paris, Master Humphrey, Lord Mayor, Jewess, Sylph, Hebe, Selina, Tournament, Douglas, Hodge's Emperor, Ruby, Bridesmaid, Rosetta superba, Seedling White, Ross's Eclipse, Queen of Beauty, Wonder, Acme, Amulet, Parson's Queen, Una, Lady Graham More, Ovid, Arabella, Madeleine, Flamingo, Madame Taglioni, Lumsden's Cerito, Augusta, and various others. Best Collection of Cut Blooms of Do., 24 varieties: *the large silver do.* offered to *Amateurs* by Mr. Denyer, was awarded to Mr. Davis. Besides the above, a collection of plants was exhibited by Mr. S. C. Rawlins, of South Lambeth; collections of Pelargóniums, by Mr. Bell, of Chelsea, and Mr. Davis, of Brixton; seedling do., by Mr. Rendle, of Plymouth, and Mr. Gaines, of Battersea; Pinks, by Mr. Cousins, Mr. Henbrey, Mr. Clark, and Mr. A. Paul; 5 seedling do., by Mr. Willmer, amongst which Wilmer's Prince of Wales and Cooper's Prince Albert, were particularly deserving of notice; Roses, by Mr. Wood, of Maresfield, Mr. Dennis, Mr. Atlee, Mr. Bruce, and by Mr. Coe, gr. to J. Spurling, Esq.; a collection of Fuchsias, by Messrs. Smith, of Hackney, consisting of F. Racemiflora, Youelli, splendens, Eclandia magna, Chandleri, Curtisii, Monypénnii, Standishii, fulgens multiflora, insignis, hybrida, and delicata: the latter a very pretty variety, having deep purple petals, and pink sepals, tipped with green; it appears to be a free bloomer, and to possess a good habit of growth: a collection of Cactuses, from Mr. Upright: a fine plant of Manéttia cordifólia, trained over a flat circular trellis, from Mr. Atlee, who also sent a large basket of Black Hamburgh Grapes.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

June 2nd.—This meeting was held at the Experimental Garden, Edinburgh. The following is a list of the prizes:—Exotic Shrubby Plants: (*Nurserymen*, silver medal), Messrs. J. Dickson and Sons, Inverleith, for Leschenáultia bíloba, Diplolæna Dampíeri, Gomphólobium polymorphum, and Brugmánsea aúrea. *Gardeners*, 1, (silver medal), Mr. J. Young, g. to T. Oliver, Esq., Newington Lodge, for Borónia serrulata, Státice arbórea, Elichrysum élegans, and Chorizema várium; 2, Mr. J. Addison, g. to the Earl of Wemyss, for Euphórbia splendens, Clématis bícolor, Pimelea decussata, and Ixora coccínea. Petu'nia phœni'cea, three varieties, 1, to Mr. Addison, for Emperor, Delecta, and Vesuvius; 2, Mr. A. Cameron, g. to J. Henderson, Esq., for Queen Elizabeth, Defiance, and Alba. New Fuchsias: 1, to Mr. Young, for F. corymbiflora, and F. fulgens multiflora; 2, to Mr. D. Brewster, g. to Col. Lindsay, for F. floribunda and F. magnifica. Cape Heaths: 1, (silver medal), to Mr. Addison, for Erica vestita alba, ventricosa alba, ventricosa coccínea, and prægnans; 2, to Mr. J. Reid, g. to the Lord Justice Clerk, for Erica hýbrida, tenella, propendens, and odorata; 3, to Mr. Young, for E. propendens, Beaumontiana, élegans, and vestita alba; 4, to Mr. G. Stirling, g. to Lord Melville, for E. élegans, perspícua, flórida campanulata, and ventricosa var. Seedling Erica, Mr. R. Watson, g. to D. Anderson, Esq. Seedling Pelargonium, named Queen Esther, Mr. A. Cossar, g. to Lady Hay. Tropæ'olum Tricolorum: 1, Mr. R. Foulis, g. to Admiral Sir P. C. H. Durham; 2, to Mr. Reid. Cinera'rias: 1, Mr. Addison, for La Faustina, splendens, pulchella, and bícolor; 2, Mr. Brewster, for purpúrea, Neilliana, bícolor, and Europæa. Cacti: 1, Mr. Brewster; 2, Mr. Young. Orchidaceous Plant, (silver medal), Mr. Alex. Smith, g. to W. Forbes, Esq., M.P., for a very large and well-flowered specimen of the curious Stanhópea oculata. The plants from the Royal Botanic Gardens were, as usual, magnificent. The collections of Pelargóniums and Calceolarias from Messrs. Dickson completely occupied the smaller tent; and although the plants were unavoidably crowded together, the effect was extremely good. Messrs. Eagle and Henderson sent a collection of Ericas, Pimeleas, Fúchsias, and Cacti; Messrs. Lawson and Son a rich collection of Pansies, and a large plant of Fúchsia corymbiflora; and Messrs. Handasyde another rich collection of Pansies, and two brilliant specimens of the double-flowered Azálea coccinea. The contributions from private collections were likewise highly meritorious. A specimen of Achímenes longiflora, from the garden of D. Anderson, Esq., was the first ever seen in flower in Scotland, and evinced the excellent management of his gardener, Mr. Watson. Mr. Gow produced four elegant Fúchsias, and several beautiful species of the genera Gladíolus and I'xia. Mr. Forrester exhibited 25 different species of Iris, in flower; also several of the rarer species of Pæónia, and 30 varieties of double garden Anemonies. Mr. Cuthbertson exhibited a collection of fine Tulips. There were some admirable Cape Heaths from the collection of Professor Dunbar, and several fine stove and greenhouse plants from the garden of Dr. Neill. Mr. Thompson produced several seedling Fúchsias, and a seedling Pimelea; and Mr. Connacher some beautiful seedling Calceolárias, not inferior to most of those so highly prized by florists. Mrs. Haig, Mr. Downie, and Mr. C. Jack, also contributed showy plants or cut flowers to the exhibition. Mr. Mossman sent a basket of Kean's seedling Strawberry; and Mr. Carstairs produced some remarkable large specimens of Myatt's Victoria Rhubarb, six stalks, with the leaves attached, weighing no less than 24lb.

COUNTRY SHOWS.

Bath Horticultural Society, May 19.—The second show for this season took place in the Horticultural Gardens, Victoria Park. The following is a list of the prizes:—Tulips, Class I. *Nurserymen*: Stand of nine, 1, Triomphe Royale, Pearson's Helen, Cardinal, Surpasse Catafalque, Polyphemus, Washington, Triomphe de Lisle, Holmes's King, Lansdown, Mr. Sealey, Bristol; 2, Mr. Cole, Wellow. Anemones: Stand of 12, 1, Messrs. Garraway and Co., Bristol. Pansies: 24 varieties, 1. Queen of England, Admiral Dixon, Princess Royal, Victory, Rotundiflora, Curion, Jehu, Eclipse, Pearl, True Blue, Earl Fitzhardinge, Bathonia, Laura, Wild Dutchman, Prince of Wales, Kate, Superb, Prince Albert, Earl of Clarendon, Peter Dick, Robin Adair, Miss Stainforth, Midas, Grand Duke of Russia, Desirable, Mr. Maule, Bristol; 2, Allan's No. 2, Carpenter's Princess Royal, Lady Fuller, Garraway's Claudiana, Imogene, Cormack's Beauty of the Village, Hurd's Defiance, Robin Adair, Brown's Curion, Allan's Invincible, Thomson's Grand Duke, Garraway's Constantia, Garraway's Seedling, Kitley's Bathonia, Village Maid, Admiral Dixon, Desirable, Cormack's Yellow Seedling, Captivation, Yeele's Trivonia, Marchman's Rival Yellow, Zebra, Mariner, Garraway's Seedling, Messrs. Garraway and Co., Bristol. Basket of Cut Flowers: 1, Mr. Carpenter. Tulips, Class II. *Amateurs*: Single Bloom, 1, Rose Manon, R. Godfrey, Esq. Collection of six, 1, Cornwallis, Ambassadeur de Holland, Miles's No. 1, Tam O'Shanter, Holmes's King, Platoff, Mr. Miles; 2, Vandyke, Roi de Siam, Triomphe Royale, Platoff, Heroine, Aglaia, R. Godfrey, Esq. Anemones: Five Blooms, 1, 2, Mr. Gerrish. Turban Ranunculuses: Collection of 12, 1, Mr. Miles. Pansies: Collection of 18, 1, Eclipse, Miss Stainforth, Wonder, Trivarno, Cream, Newbitonia, Carpenter's Princess Royal, Wharton's Queen of England, Victory, Launcelot, Delicata, Maid of Honour, Robin Adair, Rival Yellow, Duchess of Richmond, Paris, Earl of Clarendon, Duke of Wellington, J. M. Yeele's, Esq.; 2, Princess Royal, Duke of Wellington, Victory, Trivarno, Grand Duke of Russia, Curion, Earl of Clarendon, Prince of Waterloo, Grand Duke, Captivation, Cream, Bathonia, Launcelot, Queen of England, Duchess of Kent, Beauty of the Village, Eclipse, Betty Twiford, Mr. Salter. 12 varieties, 1, Marchman's Rival Yellow, Cooke's Triumphant, Yeele's Trivonia, Victory, Duke of Beaufort, Launcelot, Beauty of Hitchin, Duchess of Richmond, Mrs. Hooper, Lord's Queen, Victory, Carpenter's Princess Royal, Mr. G. Fisher; 2, Rev. J. Bond. Seedling, 1, Pond's Hero of Somerset, Miss Bayley. Stocks: Red, 1, T. Emerson, Esq.; White, Mr. Lidlard.—Plants in Pots, Class I. *Nurserymen*. Greenhouse Plants: Collection of nine, 1, Messrs. Salter and Wheeler. Cape Ericas: Collection of six, 1, Erica hýbrida, E. vestita cárnea, E. múndula, E. odorata, E. fastigiata lútea, E. Beaumóntia, Messrs. Garraway and Co. Pelargóniums: Collection of 12, 1, Gaines' King, Matilda, Jewess, Joan of Arc, Grand Duke, Sylph, Róseum élegans, Amethyst, Victory, Alexandrina, Gipsy, Rambler, Mr. Carpenter; 2, Maid of Athens, Rival King, Juba, Róseum élegans, Seedling, Clarissa, Viola, Lord Bexley, Seedling, Mabel, and two others, Messrs. Salter and Wheeler. Calceolarias: Shrubby, 1, Rubra, Elegans, Fúlgida, Sarah, Prince Albert, Mrs. General Andrews, Bronze, Viscosa superba. Herbaceous, 1, Bícolor, Rotunda, Princess Royal, Rubra, Saltérii, Splendens, Purpúrea perfecta, Mayor of Bath, Messrs. Salter and Co. Hardy Plants: Collection of eight, do. American Plants: *Best* 4: 1, Messrs. Salter & Co. Fuchsias—Collection of 3: 1, Messrs. Garraway, Mayes, & Co., Péndula terminalis, insignis, fulgens. Basket of Plants—1, Messrs. Salter and Wheeler; 2, Mr. Carpenter. Class II. *Amateurs*; Orchidaceous: Collection of three: 1, 2, J. Jarratt, Esq., Oncídium stramíneum. Single specimen: J. Jarratt, Esq., Saccolábium guttatum. Stove Plants: Collection of five: 1, J. Jarratt, Esq. Single specimen, 1, do.; 2, Miss Bayly. Greenhouse Plants: Collection of six, 1, J. M. Yeeles, Esq.; 2, Miss Bayly. Best Collection of four, 1, J. Jarratt, Esq. Single specimen, 1, J. M. Yeeles, Esq.; 2, J. Jarratt, Esq. Ericas: Collection of four, 1, J. M. Yeeles, Esq., Erica hybrida, E. Bowieana, E. perspícua nana, E. vestita coccínea; 2, G. C. Tugwell, Esq. Single specimen, 1, J. M. Yeeles, Esq. Pelargoniums: *Light*, 1, G. C. Tugwell, Esq.; 2, W. Blair, Esq. *Rose*, 1, Dr. Kay; 2, G. C. Tugwell, Esq. *Red*, 1, Dr. Kay; 2, J. M. Yeeles, Esq. *Dark or mottled*, 1, Dr. Kay. Best Collection of twelve, 2, J. Jarratt, Esq.—Grand Duke, Jehu, Chef-d'œuvre, Garth's Perfection, Alexandrina, Coronation, Rienzi, Florence, Clarissa, Arabella, and two others. Calceolarias: *Shrubby*, 1, J. M. Yeeles, Esq.—Miss Kemble, Lady of the Lake, Magniflora grandiflora, Splendidíssima, Pilot, Towárdii coccínea. *Herbaceous*: 1, J. M. Yeeles, Esq., Adonis, Queen Dowager, Victoria, Prince Albert, Conqueror of Europe, Criterion. Hardy Plants: Best four, 1, J. Jarratt, Esq. Fuchsias: Collection of three, 1, Miss Bayly. Basket of Plants: 1, J. M. Yeeles, Esq.; 2, Miss Bayly. Mr. Shaw's Prizes. Pelargoniums, 12, 1, Mr. Lucas, gr. to Mr. Shaw, Róseum élegans, Gaines's King, Clarissa, Jehu, Sylph, Dennis's Perfection, Bridegroom, Una, Priory Queen, Jewess, Sultan, Alicia; 2, J. M. Yeeles, Esq., Sultan, Róseum elegans, Sylph, Magna Charta, Mable, Alicia, Joan of Arc, Conservative, Florence, Nymph, Coronation, Victory. PLATE PRIZE. TULIPS: Six blooms, 1, Miss Bailey, Polyphemus, Heroine, Holmes's King, Richard the Third, Captain White, Ophir; 2, Mr. Lockstone, Polyphemus, Lady Collingwood, Triomphe Royale, Claudiana, Holmes's King, Well's Addison. FRUIT: *Pine-Apples*—Black, 1, Messrs. Garraway & Co. *Grapes*, Black: 1, G. C. Tugwell, Esq. White, 1, Mr. Hatch, gr. to P. J. Miles, Esq. Any sort, Mr. Spencer, gr. to the Marquess of Lansdowne. *Melons*, 1, J. Jarratt, Esq. *Strawberries*, 1, Mr. Spencer, gr. to the Marquess of Lansdowne; 2, R. S. C[illegible]ttwell, Esq.; 3, Mr. Minety. VEGETABLES: *Peas*, 1, Mr. Rogers. *Kidney Beans*, 1, W. P. Jillard, Esq.; 2, J. Wiltshire, Esq. *Cauliflowers*. Best six, 1, Mr. Lidiard. *Asparagus*, 1, do.; 2, Mr. Minety. *Potatoes*, 1, Mr. Lidiard; 2, Mr. G. D. Fisher. *Cucumbers*, 1, Miss Bailey; 2, Mr. Cooper. *Mushrooms*, 1, Mr. Minety. *Cabbages*, 1, Mr. Sparks; 2, Mr. Shackell. *Lettuces*, 1, Mr. Sealey; 2, Mr. Lidiard. EXTRA PRIZES: *Basket of Plants*, Mr. Shaw. *Fúchsias*, do. *Grapes*, Mr. Hatch. *Strawberries*, Mr. Spencer; *Basket of do.*, Miss Bayley. *Apples*, Mr. Cooke. *Basket of Salad*, Mr. Lidiard. *Rhubarb*, Mr. Minety. *Cabbage*, Mr. Cooper. *Broccoli*, Mr. Drewett. *Basket of Roses*, Miss Bayly. *Pelargóniums*, Mr. Blair. *Seedling do.*, Messrs. Pince and Co. *Botanical Specimens*, Mr. Jas. Kitley, jun. *Collection of Calceolárias*, Messrs. Salter and Wheeler. *Pelargóniums*, Messrs. Price and Co.

Bolton Floral and Horticultural Society, May 27.—The second meeting of this society took place in the Temperance Hall. The following is the list of prizes:—TULIPS: *Feathered Bizards:* Trafalgar, Mr. T. Walsh; Dutch Catafalque, do.; Alderman, Mr. Jas. Southern; Charles X., Mr. J. Morris; Firebrand, Mr. Dunderdale; Leopoldina, do. *Flamed Bizards:* Incomparable, Mr. H. Pickering; Liberty, Mr. J. Morris; Lustre, Mr. R. Dunderdale; Don Carlos, Mr. D. Rawsthorn; Black Prince, R. Heywood, Esq.; Albion, Mr. J. Morris. *Feathered Byblœmens:* Baguet, Mr. H. Pickering; Seedling, Mr. T. Walsh; Washington, do.; Bienfaite, Mr. R. Dunderdale; Beauty, Mr. J. Morris; Unknown, Mr. R. Dunderdale. *Flamed Byblœmens:* Magnus, Mr. I. Openshaw; Unknown, Mr. J. Scowcroft; Queen Charlotte, Mr. J. Morris; Atlas, do.; Incomparable, Mr. I. Openshaw; Unknown, Mr. T. Walsh. *Feathered Roses:* Princess Royal, Mr. R. Dunderdale; Lady Crewe, Mr. H. Pickering; Do-Little, Mr. I. Openshaw; Hero of the Nile, Mr. H. Pickering; Holden's Rose, Mr. J. Morris; Seedling, Mr. T. Walsh. *Flamed Roses:* Unique, Mr. Mangnall; Roi des Cerises, Mr. H. Pickering; Ponceau Brilliant, Mr. J. Morris; Vesta, Mr. R. Dunderdale; Grand Valeur, Mr. J. Morris; Lord Hill, Mr. H. Pickering. Best Bizard breeder, Mr. I. Openshaw; best Byblœmen do., Mr. R. Dunderdale; best Rose do., Mr. R. Dunderdale; best Self, Mr. T. Walsh; best Double, J. Cross, Esq. STOVE PLANTS: Euphórbia Splendens, R. Heywood, Esq.; Dracæna Purpúrea, ditto.; Ardísia Paniculata, do.; Jatropha Pandpræfólia, do.; Epidendrum Cochleatum, C. J. Darbishire, Esq. GREENHOUSE PLANTS: Pimelea Decussata, C. J. Darbishire; Epacris grandiflora, R. Heywood, Esq.; Selago Gilliesi, do.; Azálea Indica alba, C. J. Darbishire, Esq.; Boronia Serrulata, R. Heywood, Esq. ERICAS: Ventricosa Superba, Mr. J. Openshaw; Vestita fúlgida, Mr. D. Rawsthorn; Propendens, Mr. J. Openshaw; Vestita alba, Mr. D. Rawsthorn; Persoluta alba, do. PELARGONIUMS: Sylph, R. Heywood, Esq.; Gaine's King, do.; Urania, do.; Lownde's Perfection, do.; Climax, do. HERBACEOUS PLANTS: Spiræa Japónica, R. Heywood, Esq.; Cinerária Neilli, Mr. D. Rawsthorn; Cinerária imperial blue, do.; Calceolária incomparable, do.; Calceolária Kentish beauty, do. HARDY SHRUBS: Clématis azúrea grandiflora, R. Heywood, Esq.; Clématis Bicolor, do.; Sóllya Heterophylla, H. and E. Ashworth, Esqrs.; Ledum latifólium, do.; Azálea Póntica, do. PANSIES: Eclipse, Rev. D. Hewitt; Carlo Dolci, Mr. R. Dunderdale; Victory, Rev. D. Hewitt; Buonaparte, do.; Belzonii, Mr. R. Dunderdale; Admiral Napier, do., best stand of 8 cut specimens, Mr. D. Rawsthorn; do. of 6, Rev. D. Hewitt; do. of 4, do. *Cucumbers*, H. and E. Ashworth, Esqrs. *Lettuce*, J. Hardcastle, Esq. *Rhubarb*, Mr. J. Hardcastle. *New Potatoes*, H. and E. Ashworth, Esqrs. *Basket of Plants*, C. J. Darbishire, Esq.; 2, J. Lees, Esq. *Garland*, Mr. T. Walsh. *Grapes*, H. and E. Ashworth, Esqrs. JUDGES' HONORARY PRIZES: *Spinach*, J. Hardcastle, Esq.. *Lettuce*, do. *Onions*, Mr. S. Hill. *Cabbage*, do. *Gooseberries*, do. *Polygala Cordata*, W. Gray, Esq. *Fúchsia Corymbiflora*, R. Heywood, Esq. Do. *globosa*, Mr. J. Southern. *Oleander Splendens*, W. Gray, Esq. *Alonsoa grandiflora*, Mr. J. Openshaw. *Fúchsia Standíshii*, J. Hardcastle, Esq. *Rosa Deveniensis*, do. *Verbena Hendersoni*, Mr. J. Openshaw. *Grapes*, H. and E. Ashworth, Esqrs. *Basket of Plants*, Mr. J. Scowcroft.

Cambridge Florists' Society, May 24.—This exhibition took place at the Red Lion hotel. The award of the judges was as follows:—TULIPS: Mr. R. Headly, Premier prize, Osiris. *Flamed Bizarres:* Mr. R. Headly, Osiris, Polyphemus, Duke of Bedford; Mr. Haylock, 3 blooms of Polyphemus, Duke of Bedford; Mr. Cranfield, 2 blooms of Polyphemus; Mr. Twitchett, Victory, Marc Anthony; Mr. Ready, San Josef. *Flamed Byblœmens:* Mr. Ready, 3 blooms of Rubens, Wagstaff's Violet; Mr. Headly, Duke of York, Roi de Siam; Mr. Twitchett, Surpasse Salvator Rosa, Duke of York, Violet Imperial, Acapulca, Violet Rougeâtre. *Flamed Roses:* Mr. R. Headly, 2 blooms of Aglaia; Mr. Twitchett, Mad. Catalini, Cerise a Belle Forme; Mr. Haylock, 3 blooms of Triomphe Royale; Mr. F. B. Smith, Triomphe Royale; Mr. Crisp, Ponceau très Blanc, Triomphe Royale; Mr. Ready, Goldham's Maria, Dutch Brilliant. *Feathered Bizarres:* Mr. R. Headly, 2 blooms of Royal Sovereign, Dutch Catafalque; Mr. Twitchett, Victory, Platonia, Platoff, Abercromby, Castrum Doloris; Mr. Haylock, Platoff, Surpasse Catafalque; Mr. Ready, 2 blooms of Charles X., and Platonia. *Feathered Byblœmens:* Mr. R. Headly, Headly's Calypso, Lawrence's Friend, Roscius; Mr. Ready, Acapulca, Grotius, Baguet; Mr. Crisp, Roi de Siam; Mr. Cranfield, Reine d'Egypte, Washington; Mr. Twitchett, Violet Alexander, Reine de Sheba, Violet Superb. *Feathered Roses:* Mr. R. Headly, La Belle Annette; Mr. Ready, 2 blooms of Heroine, Cerise Blanche; Mr. Twitchett, Claudiana, Madame Vestris, Rosa Blanca, Minerva; Mr. Haylock, [illegible]; Mr. Crisp, Heroine; Mr. Catling, Heroine; Mr. Cranfield, Reine des Roses. PELARGONIUMS: Messrs. Hudson, Splendidissimum, Joan d'Arc, Hudson's Victory, Hudson's Miss Hudson, Duchess of Gloucester, Seedling, Hudson's Emily (seedling); Mr. Green, Seedling, Beauty of Ware. STOCKS: *Red:* 1, Mr. Crisp; 2, Messrs. Hudson; 3, Mr. Twitchett; 4, 5, and 6, Mr. Green. *White:* 1, Mr. Green; 2, Mr. Ready. *Purple:* 1, Mr. F. B. Smith; 2, Mr. Green; 3, Mr. Ready. ANEMONES, 6: Mr. Green. COLLECTION OF PLANTS: 1, Mr. Green; 2, Messrs. Hudson. CUT FLOWERS, Messrs. Hudson. BOUQUETS: 1, Mr. F. B. Smith; 2, Messrs. Hudson; 3. Mr. B. Dickerson; 4, Mr Ready. AMATEURS' BOUQUET (Mr. Green's prize), Mr. Crisp. CACTUS: 1, Mr. Crisp; 2, Messrs. Hudson. PANSIES: *Collection:* 1, Mr. J. Taylor; 2, Mr. J. Edis. 24 *blooms:* 1, Mr. R. Headly; 2, Mr. J. Headland. 12 *blooms:* 1, Mr. J. Sparrow; 2, Mr. H. Richardson. EXTRA PRIZES: Mrs. Stittle, Rhododendron Pónticum róseum; Mr. Green, Rhodanthe Manglesii; Mr. Crisp, Dodecatheon elegans; Messrs. Hudson, Seedling Pelargonium.

Cork Horticultural Show, May 18.—The second show for this season took place at the Corn Exchange. The most prominent feature in the room was the collection of plants from the Earl of Kingston's garden, in the highest degree of cultivation, and containing many large specimens of Cape Heaths, Pelargóniums, Cinerárias, Calceolárias, greenhouse Creepers, Genistas, &c., &c.; also a large collection of Vegetables and well-ripened Grapes. Capt. Hill contributed a large and varied assortment of greenhouse Plants, comprising Fúchsias, choice Pelargóniums, Oranges, and Brugmánsia Sangúinea. A tastefully arranged basket of flowers, from Mrs. Hill, was universally admired. From J. S. Barry, Esq., was a splendid specimen of Acácia Pulchella, a collection of Tulips, Calceolárias, Fúchsias, Pelargóniums, and other plants; also fine Cucumbers. From Mr. Bradford, a choice assortment of Cape Heaths, which were much admired: a fine collection of Pansies, Tulips, Persian Ranunculuses and Calceolárias. Mrs. Haynes had some beautiful Roses. Mrs. B. Fitzgerald's collection consisted of stove and greenhouse Plants, very fine Cacti and Gesnérias, some specimens of Pelargóniums, Calceolárias, and Chorozema várium; also a handsomely arranged bouquet, four feet high. Counsellor Reeves contributed specimens of Clématis Sieboldi, Fúchsia corymbiflora, Cactus speciosíssimus, with 47 flowers; and a fine collection of Pansies, also Victoria Rhubarb. Mrs. Leahy sent some Pelargóniums, Pansies, Cockscombs and Balsams, and Cucumbers. From S. Lane, Esq., there was a fine assortment of Pansies, Pelargóniums, and Ranunculuses. J. Bainbridge, Esq., contributed Tulips, Roses, and a bouquet. Miss Lyons sent a variety of greenhouse Plants. From A. Moore, Esq., there was a showy collection of Pelargóniums, Calceolárias, and other greenhouse Plants. The Tulips and Auriculas, from J. T. Cramer, Esq., were much admired. C. Crofts, Esq., had a collection of Sparaxis, from the open garden, double Anemones, and a handsome bouquet. From Counsellor Hewitt's there were some Strawberries and greenhouse Plants. W. Parker, Esq., contributed a large collection of Pansies and Turban Ranunculuses. Dr. Hodder sent cut specimens of hardy Trees and Shrubs, which were much admired; also some good Pansies. The Plants from Messrs. Haycroft's nursery were of an exceedingly beautiful description. We especially noticed many large specimens of Cape Heaths, Borónias, Eutáxias, Chorozemas, Pimeleas, and Fúchsias, also some new and splendid sorts of Calceolária and Cinerária, and many new Pelargóniums, besides a collection of Pansies, and a splendid specimen of Tropœolum tricolor. Mr. Cutter contributed a varied assortment of greenhouse Plants, amongst which were Cactus speciosíssimus, Fúchsia corymbiflora, Cape Heaths, Calceolárias, and several good Pelargóniums.

Royal Devon and Cornwall Horticultural Society, May 18.—This exhibition was held at the Royal Hotel. The following is the list of the prizes; and it should be observed that the nurserymen did not contend:—FRUIT: Best dish of *Grapes*, not less than 2 lbs. weight, 1*l*., to Mr. Luke, gr. to the Earl of Morley; 2nd best, 15*s*., Mr. Corbett, gr. to Sir W. Molesworth, Bart.; 3rd best, 10*s*., T. Holberton, Esq. Best flavoured *Melons* of any sort, 15*s*., W. C. Hodge, Esq; 2nd best, 10*s*., Mr. Roberts, gr. to Sir S. Pym. Best dish of dessert *Apples*, 7*s* 6*d*., Mr. C. Jeffery; 2nd best, 5*s*., Mr. S. Ellis, gr. to J. C. Bulteel, Esq. EXTRA PRIZES: 5*s*. to Mr. Luke, for *Strawberries*; 5*s* to Mr. S. Ellis, for *Citrons*.—FLOWERS AND PLANTS: The best six *Stove Plants*, 1*l*., Mr. Griffin; 2nd best, 15*s*., Mr. Corbett. Best collection of *Orchidaceous Plants*, 1*l*., do.; 2nd best, 15*s*., Mr. Griffin. The best collection of 8 sorts of *Greenhouse Plants* (exclusive of Pelargoniums and Ericas), 1*l*., Mr. Corbett; 2nd best, 15*s*., Dr. Budd; 3rd best, 10*s*., Mr. Griffin; 4th best, 7*s*. 6*d*., P. E. Lyne, Esq. The best group of *Ericas*, 1*l*., Mr. Griffin; 2nd best, 10*s*., Mr. Corbett. The best group of *Tender Annuals*, not less than six, 10*s*., W. C. Hodge, Esq.; 2nd best, 7*s*. 6*d*., Mr. Roberts. Best group of *Pelargoniums*, in pots, not more than 18 sorts, Gold Medal, P. E. Lyne, Esq.: best do., 12, Silver Medal, do.; best 6 do., 10*s*., do.; 2nd best do., 7*s*. 6*d*., W. H. Evens, Esq.; best *Seedling*, if a first-rate flower, Gold Medal, P. E. Lyne, Esq. Newest and rarest *American Plants*, potted, 10*s*., Mr. Griffin; best 6 varieties of *Azalea Indica*, in pots, 10*s*., Mr. Corbett; 6 best *Petunias* in pots, 5*s*., P. E. Lyne, Esq. 12 best *Verbenas*, in pots, 10*s*., Dr. Budd; 2nd best, 7*s*. 6*d*., W. C. Hodge, Esq. Best 12 *Calceolarias*, in pots, 10*s*., Mr. Corbett; best 6 *Cinerarias*, in pots, 5*s*., P. E. Lyne, Esq. 12 best *Double Anemones*, 7*s*. 6*d*., Mr. Griffin; 12 2nd best, 5*s*., Mr Taylor. Best collection of *Ranunculuses*, 15*s*, Mr. Paul; 2nd best, 10*s*., Mr. Taylor. Best collection of *Pæonia Moutan*, 7*s*. 6*d*., Mr. Griffin. Best 12 TULIPS, *Byblœmen*, 15*s*., C. Bate, Esq.; do. named do., *Bizarres*, 10*s*., do. Best collection of *Mixed Flowers*, not less than 20 sorts, 10*s*., Mr. Griffin. Best collection of *Indigenous Plants*, 15*s*., do. 6 best *China Roses*, sorts, in pots, 10*s*., W. C. Hodge, Esq. 12 best *Roses*, cut, 5*s*., Mr. Griffin. Best 12 *Heartsease*, in pots, 15*s*., H. F. Spence, Esq.; 2nd best, 10*s*., Mr. F. W. Harvey; 3rd best, 7*s*. 6*d*., T. Briggs, Esq. Best collection of *Stocks*, 7*s*. 6*d*., Mr. Paul. Best *specimen Plant*, not having before obtained a prize, 10*s*., Mr. Griffin; the rarest Plant of the latest introduction, 15*s*., do.; best design of *Cut Flowers*, 15*s*., ditto.—EXTRA PRIZES: 5*s*. to Dr. Budd, for *Greenhouse Plants*; 5*s*. to W. C. Hodge, Esq., for *Mixed Flowers*; 3*s*. 6*d*. to T. Briggs, Esq., for *Stocks*; 5*s*. to Mr. F. Wood, for beautiful cut specimens of *seedling Heartsease*; 7*s*. 6*d*. to Mr. J. Ellis, for *Indigenous Plants*.—VEGETABLES: The best *Asparagus*, not less than 100, to be decided by weight, and not to exceed 7 in. in length, 7*s*. 6d., Mr. C. Jeffery: 2nd best, 5s., Mr. Jackson. The 12 best stalks of *Rhubarb*, 5s., Mr. Jeffery; 2nd best, 3*s*. 6*d*., Mr. Roberts. The best brace of *Cucumbers*, 7*s*. 6*d*., Mr. Jeffery; 2nd best, 5*s*., Mr. Corbett. The best dish of *French Beans* 5*s*., Mr. Luke; 2nd best, 3*s*. 6*d*., Mr. Saunders. The best dish of *Peas*, 7*s*. 6*d*., J. Shepherd, Esq. The 3 best *Broccoli*, 3*s*. 6*d*., W. H. Evens, Esq. The 3 best *Cauliflowers*, 7*s*. 6*d*., W. C. Hodge, Esq.; 2nd best, 5*s*., T. Briggs, Esq. The 3 best early *Cabbages*, 3*s*. 6d., Mr. J. Taylor, gr. to Mrs. Tucker. The best *Turnips*, 3*s*. 6*d*., Mr. Corbett; 2nd best, 2*s*. 6*d*., Mr. Roberts. The 3 best *Cabbage Lettuce*, 3*s*. 6*d*., Mr. C. Jeffery. The best *Potatoe Onions*, 2*s*. 6*d*. Mr. J. Paul. The best *six sorts of Vegetables*, 10*s*., Mr. C. Jeffery; 2nd best, 7*s*. 6*d*., T. Briggs, Esq. The best *Potatoes*, the growth of 1842, 5*s*., Mr. Roberts; 2nd best, 3*s*. 6*d*., Mr. Corbett. EXTRA PRIZES: 2*s*. 6*d*. to Mr. Taylor, for *Potatoes*; 2*s*. 6*d*., Mr. Luke, for *Cucumbers*; 2*s*. 6*d*., Mr. Roberts, for *Lettuce*.—In addition, a variety of Cottagers' Prizes, varying in value from 1*s*. to 10*s*., was awarded for Flowers and Vegetables.—Mr. Lyne's collection was very splendid. His seedling Pelargonium, to which the Gold Medal was awarded, he named Lyne's Sunrise. The petals of this beautiful plant are large and broad, forming the most perfect circle. In colour it is a brilliant rose, having a black spot in the upper petals; the habit is excellent. Lyne's Lord Ebrington possesses all those qualities requisite for a first-rate show flower: it is quite round; the ground colour is a very delicate pink like Gloria Mundi; the spot covers the whole of the upper petals, with the exception of a slight margin of the ground colour, and is very black; habit very dwarf. Lyne's Cynthia has also been much esteemed, and by some was preferred to any exhibited: it is somewhat in the way of Sylph, but possesses a decided superiority in every respect. We understand that Mr. Rendle has obtained the stock of these varieties.—Of the genus Pinus there was also a fine collection, comprising the P. religiosa, P. Cembra, P. macrophylla, P. excelsa, P. Frazeri, P. halepensis, P. insignis, P. Teocote, P. from Australia, P. Arctic regions, P. Llaveana, P. leiophylla, P. Montezumæ, P. Hartwegii, P. Strobus, P. pseudo-strobus, P. oocarpoides, P. filifolia, P. Apulcensis, P. Cephalonica, P. Pinsapo, P. Morinda, P. cedrus deodara; fine specimens of the Araucaria imbricata, A. excelsa, A. Cunninghami, &c.; several new Thujas, Cupressuses, and Junipers—forming the most interesting and novel group.

Royal Horticultural Society of Cornwall, May 24.—The first exhibition for the season took place in the assembly-room, Truro. The following prizes were awarded:—FRUIT: best Pine Apple, the Earl of Falmouth; 2nd, J. S. Campbell, Esq. Best 6 Pears, of 1841, Mr. J. Bishop. Best 12 Apples, Sir C. Lemon, Bart. *Extras*. Apples, Mr. J. Bishop, jun., Sir J. C. Rashleigh, Bart. Gooseberries, R. W. Fox, Esq. FLOWERS: *Best 12 Stove or Greenhouse Plants*, Oncídium lúridum, Pitcairnia angustifólia, Oncídium papílio, Sálvia patens, Russellia júncea, Pimelea decussata, Cineraria Hendersóni, Calceolária Londoniana, Azalea Indica alba, Erythrina crista galli, Fúchsia fulgens, J. P. Magor, Esq. *Best 6 Stove Plants*, Sinníngia Schóttii, Sinníngia Hélleri, Oncídium flexuosum, On. bifólium, Cattleya Forbesii, Gesnera Suttoni, Sir C. Lemon, Bart.; 2nd, Gloxínia rubra, Cattleya Forbesii, Epidendrum cochleatum, Oncídium lúridum, On. Carthaginense, On. papílio, G. C. Cox, Esq.; best specimen of do., Franciscea uniflora, J. P. Magor, Esq. *Best Orchidaceous Plant*, Dendrobium cœrulescens, J. P. Magor, Esq. *Best 3 Bulbous Plants*, Ismene Amancaes, Tritónia squálida, Gladíolus álbidus, G. C. Fox, Esq. *Best collection of Succulents*, Cactus Jenkensóni, Ackermanni superbus, Milleri, oxypétalus, Euphórbia meloniformis, Mammilária sp. Mexico, Echevéria secunda, Sempervivum glandulosum, Sir C. Lemon, Bart. *Best 6 Greenhouse Plants*, Erica hýbrida, Erythrina crista galli, Fúchsia bícolor, Clématis Sieboldi, Fúchsia Youéllii, Alstrœméria pulchella, G. C. Fox, Esq.; 2nd do., Erica ventricosa superba, Erica hybrida, Fuchsia fulgens, F. trícolor, Calceolária, Manéttia cordata, W. Daubuz, Esq. *Best Specimen of do*, Leschenáultia bíloba, J. P. Magor, Esq.; 2nd, Fúchsia corymbiflora, W. Daubuz, Esq. *Best 12 Pelargoniums*—Acme of Perfection, Superb, Anna, Assassin, Masterpiece, Enchantress, Maid of Saragossa, Alice, Joan of Arc, Florence, Lord Arlington, Coronation, W. Daubuz, Esq.; 2nd do., Warrior, Bridegroom, Bridesmaid, Masterpiece, Foster's Nymph, Sylph, Joan of Arc, Foster's Ruby, Commodore, Pontey's Rival, Garth's Victory, King John, Edward Turner, Esq.; *best six*, Bridesmaid, Life Guardsman, Comte de Paris, Blushing Maid, Lady Flora Hastings, Garth's Victory, Mr. S. Treseder. *best specimen*, G. C. Fox, Esq.; *best collection of Cut Flowers*, Masterpiece, Queen of Devon, Foster's beauty, Acme of Perfection, Galaxy, Aurora, Prince of the [illegible], Bridegroom, Conservative, Sylph, Vivid, Fair Lady, Garth's Victory, Garth's Coronation, Apex, Sultan, Joan of Arc, Sunbeam, Nymph, Great Western, G. C. Fox, Esq., Grovehill; *second do.*, Comte de Paris, Russell's Cyrus, Grand Duke, Bridesmaid, Lady Carlisle, Foster's Nymph, Turner's Conqueror, Life Guardsman, Beauty of Plymouth, Jewess, Conservative, Bijou, Roseum elegans, Sylph, Victory, Masterpiece, Climax, Garth's Coronation, Gaines' Emperor, Priory Queen, Ed. Turner, Esq., Truro. *Best Seedling*, J. S. Enys, Esq.; *2d do*, W. Daubuz, Esq *Best miscellaneous collection of Cut Flowers*, S. Moyle, Esq. *Best collection of Petúnias*, C. W. Fox, Esq. *Best collection of Verbenas*, 9 Seedlings, Navarin, Odorata rósea, Tweediana cárnea, Pontesie, Rúgosa rósea, Drummondi, Eryana, Hendersónia, Rósea, C. W. Fox, Esq. *Best 6 Heaths*, W. Daubuz, Esq.; *2nd*, Hýbrida, Mirábilis, Vernix, Primuloides, Wilmoreana, Ventricosa superba, W. M. Tweedy, Esq. *Best four Cinerarias*, Waterhousiana, Kíngii, Haben's Seedling, Splendens, W. Daubuz, Esq. *Best six Calceolárias*, Queen of the East, Apex, Julius, Crucifera, Telemachus, Seedling, G. C. Fox, Esq. *Best collection of Heartsease*, Early, Rawlings' Nanny, Duchess of Kent, Hope, Grand Duke of Russia, Jenny Jones, Victory, Widnall's Queen Victoria, Alba, Sir H. Davy, Golden Sovereign, 2 Crowley Seedlings, Captivation, Miss Molesworth, Hurst's Wellington, Duke of Wellington, Lalla Rookh, Vivid, 2 Seedlings, Mulberry, Carlo Dolce, Early Dolce, 3 unknown, a Silver Medal; given by Mr. Sclater, Nurseryman, Exeter, W. J. Rawlings, Esq., Hayle; *second best collection of ditto*, Victory, Saint Paul's, Masterpiece, Coronation, Hero, Diadem, Delicata, Sylph, Lass of Gowrie, Grand Duke, Mulberry, Lady Flora Hastings, Flora superba, Dr. Lindley, Radical, Argo, Miracle, Duke of Wellington, Queen, La Superbe, Splendidissima, Rainbow, Rev. T. S. Carlyon; 3rd do., Mrs. W. Warren. *Best named collection of hardy Herbaceous Plants*, C. G. Fox, Esq. *Best six Roses*, Brown's superba odorata, Crimson, Boursault, Anna Maria, Caroline, Smith's Yellow, R. W. Fox, Esq. *Best six Ranunculuses*, G. C. Fox, Esq; 2nd do., W. M. Tweedy, Esq. *Best three Auriculas*, J. S. Ennis, Esq; *best specimen, do.*, G. C. Fox, Esq. *Best twelve Tulips*, Goldham's Albion, Strong's King, Surpasse Catafalque, old Dutch Catafalque, Roi de Siam, Imperatrice de Maroc, Reine de Sheba, Violet Alexander, Triomphe Royale, Cerise Blanche, Jac, Aglaia, W. J. Rawlings, Esq. *Best three distinct species of Pæonies*, Fimbriata, Moutan, Blanda, G. C. Fox, Esq. *Best collection of Stocks*, double, R. W. Fox, Esq *Best six Irises* Tenuifólia, Púmila, Sibérica, Germánica, Pállida, Lusitánica, G. C. Fox, Esq.—EXTRA: *Ten Seedling Calceolarias*, W. Daubuz, Esq. *Six Stove Plants*, Gloxínia rubra, Speciosa alba, Speciosa alba max., Vinca alba, Gardénia radicans, Manéttia glabra, W. M. Tweedy, Esq. *Orchidaceous specimen*, Brassavola verrucosa, Sir C. Lemon, Bart.—VEGETABLES: *Lettuces*, Mr. J. Bishop, jun. *Onions*, Mr. S. Treseder *Asparagus*, A. Fox, Esq.; 2nd do., Sir J. C. Rashleigh, Bart. *Cucumbers*, J. P. Magor, Esq; 2nd do., Mr. S. Treseder. *Spinach*, Mr. S. Treseder. *Rhubarb*, S. Moyle, Esq.: 2nd do., A. Fox, Esq. *Potatoes*, 1842, W. Daubuz, Esq.; 2nd do., A. Fox, Esq. *Turnips*, Mr. S. Treseder.—EXTRA: *Rhubarb*, Sir Chas. Lemon, Bart. *Cucumbers*, W. M. Tweedy, Esq. *Cabbages*, J. S. Campbell, Esq.—MARKET GARDENERS' PRIZES: *Best basket of Vegetables*, Mr. S. Treseder; 2nd ditto, Mr. J. Treseder.—A variety of prizes were also awarded to cottagers, for Flowers, Fruits, and Vegetables.

Everton and Kirkdale Floral and Horticultural Meeting, May 26th.—The first exhibition in connexion with this society, for the present year, took place in the grounds behind the Derby Arms Hotel, Kirkdale. The show was principally for Tulips, but the display of other flowers, with various fruits and vegetables, was superb. The following is the list of prizes:—TULIPS: 1, Firebrand, Lustre, Baguet, Violet Wallers, Rose Unique, and Hero of the Nile, Mr. T. Roby; 2, Catafalque, George IV., Queen Charlotte, Baguet, Lady Crewe, and Cerise Royale, Mr. W. New. *Feathered Bizard:* 1, Old Dutch Catafalque, Mr. W. J. Gandy; 2, Trafalgar, ditto; 3 Firebrand, Mr. T. Roby; 4, Catafalque, ditto; 5, Sultana, ditto; 6, Page's George IV., Mr. T. Harrison. *Flamed Bizard:* 1, Page's George IV., Mr. New; 2, Duke of Lancaster, Mr. J. Whalley; 3, Lustre, Mr. T. Roby; 4, Phœnix, ditto; 5, Surpasse la Cantique, Mr. J. Whalley; 6, Charbonnier Noir, Mr. New. *Feathered Byblœmen:* 1, Baguet, Mr. Harrison; 2, Washington, Mr. Gandy; 3, Toot, ditto; 4, Lancashire Hero, ditto; 5, Unknown, ditto; 6, Ambassadeur van Holland, Mr. Whalley. *Flamed Byblœmen:* 1, Sportsman, Mr. W. New; 2, Washington, Mr. Roby; 3, Violet Wallers, ditto; 4, Queen Charlotte, Mr. Gandy; 5, Sable Rex, ditto; 6, Lord Chancellor, Mr. Whalley. *Flamed Cherry or Rose:* 1, Triomphe Royale, Mr. Whalley; 2, Vesta, Mr. Roby; 3, Lord Hill, ditto; 4, Matilda, Mr. Whalley; 5, Vesperine, ditto; 6, Cramoise Superieure, ditto. *Feathered Cherry or Rose:* 1, Cheshire Beauty, Mr. Roby; 2, Heroine, Mr. New; 3, Walworth, Mr. Gandy; 4, Lady Crewe, Mr. Harrison; 5, Hero of the Nile, Mr. Roby; 6, Comte de Vergennes, Mr. Whalley.—PANSIES: 1, T. O. Grady, Esq.; 2, ditto; 3, Mr. Skirving; 4, Mr. W. Thompson.—STOVE PLANTS: 1, Ixora coccínea, J. Sothern, Esq.; 2, Cactus Ackermanni major, Mrs. Cropper; 3, Gloxinia superba, Messrs. Bigland and Scott.—ORCHIDACEOUS PLANTS: 1, J. Sothern, Esq.—GREENHOUSE PLANTS: 1, Borónia serrulata, Mrs. Cropper; 2, Pimelea sylvestris, Mr. T. Davies; 3, Elichrysum humile, Mrs. Cropper.—ERICAS: 1, Odorata, Mrs. Cropper; 2, Ventricosa superba, ditto: 3, Ventricosa coccínea major, Messrs. Bigland and Scott.—PELARGONIUMS: 1, Florence, Mr. Davies; 2, Priory Queen, ditto; 3, Sylph, ditto.—HARDY SHRUBS: 1, Ledum palustre, Rev. J. Brooks; 2, Azálea hýbrida, Mr. Skirving; 3, Genista Rhodopnæa, ditto.—Extra basket of CUT FLOWERS: (prize given by a lady), J. Denison, Esq., of Woolton.—Basket of CUT FLOWERS: 1, J. Sothern, Esq.; 2, J. Denison, Esq.—Basket of PLANTS: 1, Mrs. Cropper; 2, R. Leyland, Esq.; 3, ditto.—FRUITS: *Pine*, Rd. Leyland, Esq. *Strawberries:* R. Alison, Esq. *Apples:* R. Leyland, Esq. *Pears:* ditto. *Black Grapes:* 1 and 2, and *White Grapes*, 1 and 2, J. Denison, Esq. *Gooseberries:* J. Sothern, Esq. *Currants:* R. Alison, Esq. VEGETABLES—*Peas*, R. Leyland, Esq. *French Beans:* Mr. Gandy. *Asparagus:* ditto. *Cucumbers:* 1, J. G. Carter, Esq.; 2, J. Denison, Esq. *Mushrooms:* 1, Mr. Garstang; 2, R. Alison, Esq. *Potatoes*, J. Denison, Esq. *Cabbage:* J. Sothern, Esq. *Turnips* Mrs. Cropper. *Autumn-sown Onions:* ditto. *Lettuce:* R. Leyland, Esq. *Rhubarb:* 1, ditto; 2, Mr. W. E. Makin. EXTRA PRIZES.—*Ardisia crenulata* R. Leyland, Esq. *Cactus Ackermanni major*, J. Ridgway, Esq. *Statice Arborea:* Mr. Skirving. *Grapes in Pots;* R. Leyland, Esq. *Cucumbers:* J. G.

Carter, Esq. *Potatoes*: Mrs. Cropper. *Parsley*: Mr. Gandy. *Basket of Plants*: Mr. Skirving.

Felton Florists' Society, May 30th.—The florists of Felton and its vicinity held their annual show of Tulips in the dining-room of the Northumberland Arms Inn, when prizes were awarded to the following gentlemen:—*Roses*: 1 and 2, Rev. Jos. Orrell, for Triomphe Royale and Amadis; 3 and 4, Mr. W. Harrison, for Comte de Vergennes and Unique; 5, Mr. A. Gowens, for Cerise Primo; 6, Mr. W. Harrison, for Heroine. *Byblœmens*: 1, Rev. Jos. Orrell, for Triomphe de Lisle; 2, Mr W. Harrison, for Black Baguet; 3, Mr. W. Scott, for Violette ma favorite; 4, Mr. Gowens, for Pearl Blanche; 5, J. Grahamsley, Esq., for Tower of Salisbury; 6, Rev. Jos. Orrell, Blanche Violette. *Bizards*: 1, Rev. Jos. Orrell, for Demetrius; 2, J. Grahamsley, Esq., for Polyphemus; 3, Mr. Gowens, for Surpasse Catafalque; 4, J. Grahamsley, Esq., for Catafalque Supérieure; 5 and 6, Mr. Gowens, for [illegible] White and Castrum doloris. Most of the flowers exhibited were in fine condition, but some were a little too much expanded. The next show, for the exhibition of Ranunculuses and Pansies, was appointed to take place at Mrs. Hine's, the Northumberland Arms Inn, on Monday, the 27th of June, at 2 o'clock.

Hammersmith Heartsease Society, May 31.—The first show was held at Mr. Lidgard's, and if we may judge from the numerous competitors and the beauty of the flowers, the society is in a fair way of becoming useful to the growth of that very interesting flower. The following is a list of the prizes:—1st Class Amateurs, 24 *Blooms*, 1st prize 3l., to Mr. Edmonds, Wandsworth, for Grand Duke of Russia, Delicata, Lady Peel, Mulberry Superb, Eclipse, Miss Stainforth, Vivid, Beauty of Hitchin, Yellow Defiance, Jewess, Curion, Tippoo Saib, Duke of Devonshire, Edmonds' Freak, Una, Robespierre, Imogene, Russian Duke, Herbert, Flora Superb, Miracle, Desirable, Prince Albert, and Grandess. 2nd, prize, 1l. 10s., to Mr. Bridges, Hampton, for Royal Duke, Bridge's Purple Perfection, Imogene, Lady Peel, Hamlet, Lane's Purple, John, Jewess, Delicata, Yellow Defiance, Pratt's Queen, Eclipse, Miss Stainforth, Brown's Eliza, Curion, Marmion, River Lea Rival, Fairy Queen, Olympia Superb, Pontiff, Angelina, Bridesmaid, Robespierre, and Grand Turk. 3rd prize, 1l., to Mr. Bridges, Carshalton, for Grand Duke of Russia, Vivid, Eclipse, Pearl, Grandess, Alpha, Bridges' Falconer, Bridges' Carshalton Hero, do.
